Voss, Über einige Pietàdarstellungen des Battista Naldini, Berl. Mus., XLIV, 1923, pp. 15–19; U. Baldini, Un disegno di Naldini per il Salone dei Cinquecento in Palazzo Vecchio a Firenze, RArte, XXVIII, 1953, pp. 157–60). *Matteo Nigetti*: Florence, 1560–1649, architect (L. Berti, Matteo Nigetti, RArte, XXVI, 1950, pp. 157–84, XXVII, 1951–52, pp. 93–106). *Passignano* (*Domenico Cresti*): b. Passignano, ca. 1560; d. Florence, 1636; painter (H. Schwarz, Two Drawings Attributed to Domenico Passignano, AQ, XVI, 1953, pp. 337–40; A. Martini, Un singolare dipinto del Passignano, Paragone, X, 109, 1959, pp. 55–58). *Pierino da Vinci*: b. Vinci, ca. 1530; d. Pisa, 1553; sculptor (U. Middeldorf, Notes on Italian Bronzes, I: Drawings and a Tripod by Pierino da Vinci, BM, LXXIII, 1938, pp. 204–09; J. Wilde, An Illustration of the Ugolino Episode by Pierino da Vinci, Warburg, XIV, 1951, pp. 125–27). *Cristoforo Roncalli*, known as *Il Cavaliere delle Pomarance* (*Pomarancio*): b. Pomarancio, 1552; d. Rome, 1626; painter (F. Dal Monte, I disegni del Pomarancio per gli affreschi distrutti della Cupola di Loreto, Rass. marchigiana, VIII, 1929–30, pp. 41–56; I. Toesca, Pomarancio a Palazzo Crescenzi, Paragone, VIII, 91, 1957, pp. 41–45). *Matteo Rosselli*: b. Florence, 1578; d. 1650; painter (L. H. Fischer, Die Cena von Matteo Rosselli im Kloster S. Francesco in Lesina, ZfbK, XIX, 1907–08, p. 223; E. Bassi, Disegni della Accademia di Venezia, RArte, XXI, 1939, pp. 175–86). *Giovan Francesco Rustici*: b. Florence, 1474; d. Tours, 1554; painter and sculptor (C. Loeser, Gianfrancesco Rustici, BM, LII, 1928, pp. 260–72; U. Middeldorf, New Attributions to Giovan Francesco Rustici, BM, LXVI, 1935, pp. 71–81; W. R. Valentiner, Rustici in France, S. in the H. of Art Dedicated to W. E. Suida, London, 1959, pp. 205–17). *Francesco Salviati* (*Francesco de' Rossi*, or *Cecco di Salviati*): b. Florence, 1510; d. Rome, 1563; painter (H. Voss, Kompositionen des Francesco Salviati in der italienischen Graphik des XVI. Jahrhunderts, Die Graphischen Künste, XXXV, 1912, Sup., pp. 30–37, 60–70; F. Antal, Around Salviati, BM, XCIII, 1951, pp. 122–25; L. Mortari, Alcuni inediti di Francesco Salviati, S. in the H. of Art Dedicated to W. E. Suida, London, 1959, pp. 247–52). *Santi di Tito*: b. Sansepolcro, 1536; d. Florence, 1603; architect and painter (G. Arnolds, Santi di Tito: Pittore di S. Sepolcro, Arezzo, 1934; R. Chiarelli, Contributi a Santi di Tito architetto, RArte, XXI, 1939, pp. 126–55; L. Berti, Santi di Tito, BArte, XXXVII, 1952, pp. 353–54). *Gherardo Silvani*: Florence, 1579–1675, architect and sculptor (R. Linnenkamp, Una inedita vita di Gherardo Silvani, RArte, XXXIII, 1958, pp. 73–114). *Pietro Tacca*: b. Carrara, 1577; d. Florence, 1640; sculptor (E. Lewy, Pietro Tacca: Ein Beitrag zur florentiner Skulptur, Cologne, 1928; A. M. Crinò, Documenti relativi a Pietro da Cortona, Ciro Ferri, Pietro Tacca, Pier Maria Baldi, Il Guercino e Federigo Zuccaro, RArte, XXXIV, 1959, pp. 151–57). *Niccolò Tribolo*: Florence, 1500–50, sculptor (B. H. Wiles, Tribolo in His Michelangelesque Vein, AB, XIV, 1932–33, pp. 59–70; J. Holderbaum, Notes on Tribolo, BM, XCIX, 1957, pp. 336–43, 369–72). *Jacopo Zucchi*: b. Florence, ca. 1541; d. Rome, ca. 1589; painter (A. Calcagno, Jacopo Zucchi e la sua opera a Roma, Il Vasari, V, 1932, pp. 39–56, 119–68).

THE EMILIAN SCHOOL IN THE 17TH AND 18TH CENTURIES. The development of baroque architecture in Emilia was relatively unimportant, except in the field of theatrical architecture and scenography, in which Bologna made a contribution to the

formation of European rococo. The principal Bolognese structures of the baroque period were the work of the Lombard Giovanni Ambrogio Magenta (plan for the Cathedral, reconstruction begun 1605; S. Paolo, 1611) and Bartolomeo Provaglia (Palazzo Davia-Bargellini, 1638; Porta Galliera, 1661). Padre Giovanni Battista Bergonzoni gave a Borrominian cast to the Church of S. Maria della Vita (ca. 1687–90), while in the 18th century Carlo Francesco Dotti reconstructed the sanctuary of the Madonna di S. Luca, near Bologna, in a scenographic manner. The work of Alfonso Torreggiani was balanced and elegant (Oratory of S. Filippo Neri; Palazzo Montanari). In Parma, the Palazzo della Pilotta and its adjoining gardens were constructed in the 17th century according to the designs of the 16th-century Tuscan Giovanni di Tommaso Boscoli (known as Nanni da Montepulciano and as Giovanni della Fontana), and Giovanni Battista Aleotti built the Teatro Farnese in a Palladian style.

Equally modest was the development of sculpture in this period; the leading Bolognese sculptor, Alessandro Algardi (q.v.), went to Rome to work (II, PLS. 164, 168). In Rome, his classicistic and balanced sense of measure represented the chief opposition to Bernini's boldly imaginative sculpture. It was Camillo Mazza (a pupil of Algardi) who, with his son Giuseppe (who also worked in Venice), brought the Emilian tradition of terra-cotta work back into respect. This work in terra cotta was continued by Filippo Scandellari (Scandellarra) with his crèche figures.

Emilia's role in painting at this time was quite significant. Bolognese painting of the time was an important aspect of European baroque art. Bartolomeo Passarotti (IX, PL. 297) enlivened his mannerist style with a genuine sense of reality, similar to that of the Lombard Campis; and the Carraccis (q.v.), schooled in the methods of Passarotti, combined their early apprenticeship in naturalism with the study of Correggio and the great Venetian tradition. Annibale Carracci and his pupils Domenichino (q.v.), Francesco Albani (PL. 219), and Giovanni Lanfranco all worked in Rome and developed a style so distinct from the realism of Caravaggio that even in Rome their school was called "Bolognese." Guido Reni (q.v.), along with others, transferred his allegiance from the Fleming Denys Calvaert to the school of the Carraccis. Reni's compositional structure, his concern with ideal perfection, and his expression of emotions opened the way for the classicism that Poussin and Maratti were to develop in the course of the 17th century. In his late works Reni achieved a dematerialized style, composed of luminous transparencies, veiled impasto, and pastel tonalities that anticipated the art of Luca Giordano and the 18th century. The art of Domenichino was even more classicistically oriented (PL. 218); his clear renderings of figures have an almost Raphaelite sense of grace and design. Only the Parmesan Lanfranco stood apart from classicism in seeking to develop the scenographic and baroque possibilities (breaks in the sky, foreshortening, dynamic masses) already implicit in the style of his compatriot Correggio.

Two painters of this period who may be classified as "petits maîtres" were noted for their primary interest in pictorial values. They were Scarsellino and Mastelletta. Scarsellino (I. Scarsella) of Ferrara adapted the style of Veronese and Bassano to the simple, intimate poetry of his small compositions (PL. 217). Mastelletta (Giovanni Andrea Donducci) of Bologna created scenes and landscapes with a rapidity of brush stroke that endowed the imaginative elegance of mannerism with a particular vivacity and charm.

The luministic and anticlassic branch of Emilian painting derived from the art of Lodovico Carracci, though some contact with the work of Caravaggio is also evident. Its leading advocates were Lionello Spada; Bartolomeo Schedoni (II, PL. 197), an original exponent of forms stylized by lighting effects; Giacomo Cavedone, whose sturdy naturalism was rich in Venetian influences (PL. 219); and Guercino (q.v.), whose airy luminism and warm, Venetian palette resulted in an atmospheric pictorialism that had extensive influence (II, PL. 197). The early luminism of Guercino (PL. 218), which paralleled that of Caravaggio, later froze into a classicizing and conventional academicism that was inspired by Guercino's desire to surpass his rival Guido Reni.

Reni, Domenichino, and Albani, who worked in their native Bologna as well as elsewhere, were the masters of the classical branch of Emilian art, which was in opposition to the trend that derived from Lodovico Carracci. Reni's followers included the Fleming Michele (di Giovanni) Desubleo (called "Michele Fiammingo"), Francesco Gessi, Giovanni Andrea Sirani and his daughter Elisabetta, and Simone Cantarini da Pesaro, who was also a skillful engraver. Carlo Cignani interpreted the classicism of these masters with 18th-century grace, and Guido Canlassi (known as Cagnacci), who emigrated to Vienna about 1660, combined the influence of Reni with that of Venice.

The Italian perspectivists (q.v.) known as *quadraturisti* developed the illusionistic possibilities inherent in the decorative perspective of late Roman mannerism [Cherubino (Zaccaria Matteo) Alberti]. This special category of perspectivists included Girolamo Curti, known as Dentone, Angelo Michele Colonna, Agostino Mitelli (I, PL. 409), the several generations of the Galli family (known as Bibiena after their native Tuscan village), architects and scenographers who worked throughout Italy and Europe until the end of the 18th century. The Galli Bibienas' great significance derived from their diffusion of a taste for perspectivism and scenography, which marked one of the highest achievements of the period in which baroque decoration merged with the rococo. An important example of the taste for perspectivism and scenography is the dome of S. Ignazio in Rome, by Fra Andrea Pozzo (q.v.; II, PL. 172). Other artists who worked in this style were Vittorio Maria Bigari and Stefano Orlandi, who collaborated (as figure painter and perspectivist respectively) in the decoration of 18th-century villas and palaces in Milan, Verona, and Turin.

Aside from this specialized current, the two main trends of 17th-century Bolognese painting influenced 18th-century painting in that city. The tendency bound to classicistic canons, specifically those deriving from Reni, included such artists as Giovan Gioseffo dal Sole, Marco Antonio Franceschini, Donato (Donatino) Creti, Ercole Graziani the Younger, and Francesco Monti (called "Il Brescianino delle Battaglie"). The other tendency, pictorially more vital, derived from the tradition begun by Lodovico Carracci and included among its exponents Lorenzo Pasinelli, Gian Antonio Burrini, and Giuseppe Maria Crespi. Crespi studied the work of Lodovico and Guercino and, instinctively inclined toward the simple human poetry of observed reality, created a style worthy of Chardin or of 17th-century Dutch painting (PL. 221; III, PL. 313). The Gandolfi brothers, Ubaldo and Gaetano, painted in a decorative style inspired by Tiepolo; they attempted a free-ranging dynamism of structure that was not without a certain superficiality.

Bean, A propos de Bartolomeo Schedoni, Aurea Parma, XLI, 1957, pp. 111–14). *Elisabetta Sirani*: Bologna, 1638–65, daughter of *Giovanni Andrea Sirani*, Bologna, 1610–70, both painters (M. Minghetti, Elisabetta Sirani, Bologna, 1877; A. Manaresi, Elisabetta Sirani, Bologna, 1897; E. F. Edwards, Elisabetta Sirani, Art in Am., XVII, 1928–29, pp. 242–46; E. Mauceri, La Madonna della Rosaria di Elisabetta Sirani, Il Comune di Bologna, XX, 9, 1933, pp. 21–22). *Lionello Spada*: b. Bologna, 1576; d. Parma, 1622; painter [M. Marangoni, Un affresco dimenticato di Lionello Spada, BArte, V, 1911, pp. 152–53; J. Hess, Modelle e modelli del Caravaggio, Comm, V, 1954, pp. 271–89; V. Alce, Cronologia delle opere d'arte della Cappella di San Domenico in Bologna dal 1597 al 1619 (II), Arte antica e moderna, I, 1958, pp. 394–406]. *Alessandro Tiarini*: Bologna, 1577–1668, painter (F. Malaguzzi Valeri, Alessandro Tiarini, Cron. d'arte, I, 1924, pp. 133–54; T. Fiori, La prima attività bolognese di Alessandro Tiarini, Comm, VIII, 1957, pp. 105–12).

NEAPOLITAN AND SICILIAN ART FROM THE 16TH CENTURY ON. The many northern Italian artists working in the south in the early 16th century (e.g., Antonio Solario, Cesare da Sesto, Polidoro da Caravaggio, Vincenzo da Pavia) were responsible for a cultural eclecticism in Naples and Sicily that influenced such local artists as Andrea Sabatini (Andrea da Salerno) and Giovan Filippo Criscuolo. Naples maintained contact with Rome, especially with the current of Raphael, in part because of the Roman work of the Neapolitan painter and architect Pirro Ligorio. Neapolitan artists were receptive to mannerism and formed their styles around the work of Marco dal Pino (Marco da Siena) and the Cavalier d'Arpino (Giuseppe Cesari). In the work of Belisario Carenzio and Fabrizio Santafede, Venetian influences were quite important. In Sicily, Girolamo Alibrando of Messina was a friend of the Lombard artist Cesare da Sesto; Vincenzo (degli Azani) da Pavia (also called "Il Romano") did a considerable amount of work in Sicily; and the Neapolitan Deodato Guinaccia (Deodato Napoletano), who worked in Messina, was a follower of Polidoro da Caravaggio. Another Neapolitan, Mario di Laureto, worked in Sicily, while Tommaso Laureti of Palermo worked in Rome and Emilia. The Tuscan Filippo di Benedetto Paladini (Paladino) moved to Sicily in 1601, taking with him an elegance derived from Florentine mannerism. Sicilian sculpture was also dominated by Tuscans (Montorsoli, F. Camilliani, and Calamech), and Michelangelo Naccherino and Pietro Bernini worked in Naples.

Baroque architecture was introduced in Naples by Giuseppe Valeriani, the Jesuit who designed the Church of the Gesù Nuovo (1584–1601), and Domenico Fontana (q.v.), both architects of Roman origin. The Lucanian Francesco Grimaldi, a Theatine (S. Paolo Maggiore, 1591–1603; S. Maria degli Angeli; SS. Apostoli; Chapel of S. Gennaro, or Chapel of the Treasury, Cathedral, 1608), and the Florentine Giovan Antonio Dosio also worked in Naples (Chiesa dei Gerolomini) at this time. Numerous buildings were designed in the first decades of the century by the local architects Giovanni Giacomo Conforto and Fra Giuseppe Nuvolo (Giuseppe Donzelli), a Dominican. The Neapolitan baroque was dominated, however, by the Bergamask sculptor and architect Cosimo Fanzago, whose art was characterized by a rich and animated sense of the pictorial (Great Cloister of the Certosa di San Martino, PL. 225; Chapel of the Royal Palace; Palazzo Donn'Anna, unfinished; Church of S. Teresa a Chiaia, 1650–62).

The work of artists from northern Italy also dominated sculpture. In addition to Fanzago, two noteworthy sculptors were Giuliano Finelli (bronze statues of SS. Paul and Peter in the Chapel of S. Gennaro, Cathedral) and Andrea Bolgi, both of whom had worked with Bernini and brought that artist's style to Naples. The pictorial realism in Neapolitan art found notable expression in wood and terra-cotta crèche figures and in Capodimonte porcelain. Masters of this genre were the sculptors Lorenzo Vaccaro, Matteo Bottiglieri, Giuseppe Sanmartino (Sammartino), and Francesco Celebrano.

Francesco Solimena exerted a great influence on the development of 18th-century Neapolitan architecture as well as painting; among the architects who felt his influence were Giambattista and Muzio Nauclerio, Ferdinando Sanfelice (FIG. 437), and Domenico Antonio Vaccaro. A later contemporary was Luigi Vanvitelli, son of the Dutchman Gaspar van Wittel. Vanvitelli, who was born in Naples and moved to Rome, was recalled to Naples (1751) to build the imposing Royal Palace of Caserta for Charles III (PL. 226; FIG. 437); many sculptors collaborated on the adornment of the palace park (PL. 441; X, PL. 267). The Florentine Ferdinando Fuga, who also worked in Naples at this time, constructed the Albergo dei Poveri, a monumental example of civil architecture.

Sicilian baroque architecture is particularly noteworthy. In the baroque period Sicilian artists regarded study in Rome as a fundamental part of their development. Thus, Roman influences were combined with the Tuscan influences that had been brought to the island by the Tuscan mannerists mentioned above and by the architect and sculptor Antonello Gaggini (Gagini). The Tuscan architect Giacomo del Duca worked in Messina after 1588. The mannerist tradition was continued at the beginning of the 17th century in the work of the Lombard Giulio Lasso [Palermo, Quattro Canti (Piazza Vigliena), 1609]; Mariano Smiriglio, Giacomo (Jacopo) Besio of Savona (Palermo, S. Giuseppe dei Teatini, 1616); Giovanni Vermexio (Vermescio); and the Jesuit Natale Masuccio. The influence of the new trends in the work of these architects is evidenced in the use of elaborate decoration and Spanish motifs rather than in architectural design. In 1660 Guarino Guarini (q.v.) built the Church of the Annunziata in Messina. In the ensuing decades, the baroque style was established in Palermo by the work of Paolo Amato (S. Salvatore, begun 1682) and Giacomo Amato, who had studied the art of Rainaldi in Rome (S. Teresa, 1686; Church of the Pietà, 1689). The disastrous earthquake of 1693 necessitated the reconstruction of many cities in eastern Sicily. In Catania, the most important architecture of this period was created by Giovanni Battista Vaccarini of Palermo (PL. 225), who felt the charm of Borromini's work (Palazzo del Municipio; S. Agata, 1735–67; II, PL. 146). Vaccarini added new elements to the tradition of the Amatos, which was continued by Andrea Palma and the Jesuit Angelo Italia. The reconstruction of the cities of Noto (conceived in a particularly beautiful and scenographic manner), Ragusa, Modica, and Comiso, among others, occupied many Sicilian architects, one of the most outstanding of whom was Rosario Gagliardi. Their brilliant handling of traditional Sicilian motifs (such as the towering central part of façades) was marked by bold confidence and delicate movement (e.g., Noto, S. Domenico; Ragusa, S. Giorgio, S. Giovanni; Modica, S. Giorgio).

A great architect, Filippo Juvara (q.v.) of Messina, left Sicily, studied in Rome with Carlo Fontana, and became the official architect of Victor Amadeus II in Turin. Juvara also worked in Portugal and Madrid.

The sculpture of this period developed by families and workshops rather than by individual artists. The workshops of Antonello Gaggini and the Ferraros (who worked in stucco) dominated 16th- and early-17th-century Sicilian sculpture; similarly the Serpottas dominated the second half of the 17th century and the first decades of the 18th. Giacomo Serpotta applied his exceptional talents to stuccowork, and his taste and elegance, derived from French art and enhanced by contemporary styles, were tempered by an easy-going naturalism (Palermo, oratories of S. Lorenzo, 1690–1706, II, PL. 169; S. Zita, 1668–1718; Rosario di S. Domenico, 1710–17; statues in S. Francesco d'Assisi, 1723). Another noteworthy sculptor in 18th-century Sicily was Ignazio Marabitti, a student of Della Valle in Rome and the creator of a style that was more virtuosic than refined.

A particular manifestation of 18th-century architecture in southern Italy was the picturesque baroque of the monuments of the city of Lecce, rich in decorations carved from the soft local stone. Noteworthy structures include the Cathedral (1659–70) by Giuseppe Zimbalo; the Church of Sta Croce (II, PL. 146), on which Giuseppe and Francesco Zimbalo worked; and the palace of the Seminario (1694–1709), by Giuseppe Cino.

Naples occupies an outstanding position in the over-all panorama of the development of 17th-century Italian painting. Artists from other areas contributed in varying degrees to the elaboration of Neapolitan style. Caravaggio (q.v.) was in Naples

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

in 1607, and the Spanish artist Ribera (q.v.) was there from about 1616. Guido Reni (q.v.) arrived in 1622, Artemisia Gentileschi (q.v.) worked in Naples from 1636, and both Domenichino (q.v.) and Giovanni Lanfranco worked there for several years. Caravaggio and the Bolognese decorative styles often influenced the same artists. Thus, the extremely talented Giovanni Battista Caracciolo (PL. 224), who was initially a follower of Caravaggio (e.g., *The Liberation of St. Peter*; II, PL. 183), adopted a style of Bolognese derivation after 1620. Ribera's early artistic preparation was in the style of the Caraccis, but after his contact in Naples with the style of Caravaggio, the Spaniard developed a solidly realistic style. Although Artemesia Gentileschi was a follower of Caravaggio, she maintained an elegance of form and color in her painting that was to influence the work of such local artists as Massimo Stanzione and Bernardo Cavallino (PL. 224). Artemisia Gentileschi's influence was complemented by the residual influence of 16th-century Neapolitan formalism and reflections of Flemish art (Van Dyck rather than Rubens). The work of Andrea Vaccaro and Francesco (Pacecco) De Rosa reflected similar influences. The Neapolitan influence of Ribera — which was particularly important for the work of Francesco and Cesare Fracanzano in Apulia — was sometimes complemented by accents of Velázquez (who had been in Naples in 1630–31) or Grechetto (Giovanni Benedetto Castiglione), who had been in Naples in 1635.

Although the sources of Neapolitan realistic painting were as diverse in temper as Caravaggio and Ribera, they were combined with ease in portrayals of daily life, a genre represented in Rome by the Dutchman Pieter van Laer and Michelangelo Cerquozzi (see BAMBOCCIANTI). The Bergamask-Roman Viviano Codazzi, a perspectivist closely related to the Bamboccianti, worked in Naples in 1634–48, painting views of monuments adorned with figures. The Neapolitan Aniello Falcone painted similar subjects, as did his pupil Domenico Gargiulo (Micco Spadaro). Falcone acquired particular renown as a painter of battles, a genre popularized in Rome by Jacques Courtois (Il Borgognone). The Neapolitan Salvator Rosa (q.v.), too, was famous as a painter of battle scenes. Although he left his native city as a young man to work in Florence and Rome, he remained Neapolitan in spirit and style, even though his development was away from genre painting toward the *peintre-philosophe* ideal represented by Poussin. Still life enjoyed particular success in Naples in the work of Giovanni Battista Ruoppoli (Ruopolo) and Giuseppe Recco, both of whom assimilated a typically baroque exuberance of composition and color with the influence of Caravaggesque luminism.

Decorative painting in the grand style was revitalized by two artists, Mattia Preti (II, PL. 203) and Luca Giordano. Mattia Preti's early training was in the style of Caravaggio, but study of Lanfranco, Guercino, and the 16th-century Venetians resulted in a style rich in dramatic vigor; Luca Giordano's luministic paintings opened the way for 18th-century art in Italy and Spain (PL. 224; II, PLS. 204, 205; V, PL. 226).

Francesco Solimena, whose art straddled the 17th and 18th centuries, inherited the grand manner of Lanfranco, Pietro da Cortona (q.v.), Preti, and Giordano and created a decorative style that influenced Neapolitan painting throughout the 18th century (PL. 227). Influenced in varying degrees by Solimena were Francesco de Mura, Corrado Giaquinto, and Sebastiano Conca. Conca moved early to Rome. Giaquinto, an extremely sensitive painter, worked in Rome for many years, in Turin (where he collaborated with De Mura on the Royal Palace), and in Madrid (1753–62), where he influenced the artistic development of Francisco Goya. It was because of Giordano and Giaquinto that Neapolitan painting achieved European importance at this time. In the 18th century Gaspare Traversi (whose work was often confused with that of the less distinguished and academic Giuseppe Bonito) continued the realistic portrayal of scenes of daily life. An ironic observer of contemporary mores, Traversi worked in Rome and Emilia.

The mannerism of Filippo Paladino long survived in Sicilian painting, but in Palermo Pietro Novelli, influenced by Ribera and Van Dyck (who was in Palermo in 1624), came into prominence. Caravaggio was in Sicily (1608–09), but his influence was little felt outside of Messina. There was a foreign exponent of the Caravaggesque style in Sicily in the Fleming Matthias Stomer, who worked in the manner of Gerrit van Honthorst. In the 18th century many Sicilian decorative painters drew inspiration from Roman and Neapolitan painting. Among these artists were the Fleming Willem (Guglielmo) Borremans and the more vigorous and original Palermitan Vito d'Anna.

Bottineau, À propos du séjour espagnol de Luca Giordano (1692–1702), GBA, LVI, 1960, pp. 249–60]. *Francesco Guarini* (*Guarino*): Solofra, 1611–54, painter (L. Landolfi, De' dipinti e della vita di Francesco Guarini da Solofra, Naples, 1852). *Francesco de Mura*: Naples, 1696–1782, painter (E. Carli, Segnalazioni di pittura napoletana, L'Arte, N.S., IX, 1938, pp. 255–79; C. Gilbert, Italian Paintings at St. Meinrad Archabbey, GBA, LII, 1958, pp. 355–68). *Pietro Novelli*: b. Monreale, 1603; d. Palermo, 1647; painter (G. di Stefano, Pietro Novelli il Monrealese, Palermo, 1940; R. Salvini, La mostra di Pietro Novelli a Monreale, Le Arti, II, 1939–40, pp. 116–17). *Giacomo del Pò*: b. Rome, 1652; d. Naples, 1726; painter and architect (G. Ceci, Notizie e documenti su artisti napoletani, V: Nascita e morte di Giacomo del Pò, Arch. d'Italia, 2d Ser., IV, 1937, pp. 237–38; M. Picone, Per la conoscenza del pittore Giacomo del Pò, BArte, XLII, 1957, pp. 163–72, 309–16). *Mattia Preti*: b. Taverna, 1613; d. Malta, 1699; painter (A. Venturi, Mattia Preti, Rome, 1925; A. Frangipane, La pittura e il dramma di Mattia Preti, Brutium, XXXVI, 7–8, 1957, pp. 2–11; C. Refice Taschetta, Contributo alla conoscenza di Mattia Preti, Brindisi, 1959). *Giovanni Battista Quagliata*: Messina, 1603–73, painter (E. Mauceri, Giovan Battista Quagliata, BArte, N.S., I, 1921–22, pp. 381–85). *Giuseppe Recco*: Naples, 1634–95, painter (F. Zeri, Giuseppe Recco: Una natura morta giovanile, Paragone, III, 33, 1952, pp. 37–38; N. di Carpegna, I Recco: Note e contributi, BArte, XLVI, 1961, pp. 123–32). *Francesco* (*Pacecco*) *de Rosa*: Naples, ca. 1600–54, painter (A. Pigler, Pacecco de Rosa müvészetéhez, AErt, XLV, 1931, pp. 148 ff.). *Salvator Rosa* (q.v.). *Giovanni Battista Ruoppoli* (*Ruopolo*): Naples, 1620–85, painter [M. Marangoni, Valori mai noti e trascurati della pittura italiana del Seicento (alcuni pittori di "Natura morta"), RArte, X, 1917, pp. 1–31]. *Giuseppe Sanmartino* (*Sammartino*): Naples, 1720–93, sculptor (G. Alparone, Note sul Cristo velato nella Cappella Sansevero a Napoli, BArte, XLII, 1957, pp. 179–85; G. Alparone, Un bozzetto del Corradini ed una statua dispersa del Sanmartino, BArte, XLV, 1960, pp. 287–88). *Giacomo Serpotta*: Palermo, 1656–1732, sculptor (F. Meli, Giacomo Serpotta, Palermo, 1934; N. Basile, Serpottiana, Palermo, 1935; P. Fazio, Giacomo Serpotta, Palermo, 1956). *Francesco Solimena*: b. Canale di Serino, 1657; d. Naples, 1747; painter (F. Bologna, Francesco Solimena, Naples, 1958). *Massimo Stanzione*: b. Orta d'Atella, 1585; d. Naples, 1656; painter (C.T. Dalbono, Massimo Stanzione e i suoi tempi e la sua scuola, Naples, 1871; H. Voss, Charakterköpfe des Secento, I: Massimo Stanzione, Mnh. für Kw., I, 1908, pp. 266–74; H. Schwanenberg, Leben und Werk des Massimo Stanzione, Bonn, 1937; U. Baldini and L. Berti, Note brevi su inediti toscani, BArte, XXXVIII, 1953, pp. 277–83). *Gaspare Traversi*: Naples, d. 1769, painter (R. Longhi, Di Gaspare Traversi, Vita artistica, II, 1927, pp. 145–67; R. Longhi, Traversi: Un'opera e nuove notizie, Paragone, I, 1, 1950, pp. 44–45; A. Ghidiglia Quintavalle, Inediti di Gaspare Traversi, Paragone, VII, 81, 1956, pp. 39–45). *Giovanni Battista Vaccarini*: b. Palermo, 1702; d. Milazzo, 1768; architect (F. Fichera, Giovan Battista Vaccarini e l'architettura del Settecento in Sicilia, 2 vols., Rome, 1934; A. Giuliana-Alajmo, Giovan Battista Vaccarini e le sconosciute vicende della sua vita, Palermo, 1950). *Andrea Vaccaro*: Naples, 1598–1670, painter (M. Commodo Izzo, Andrea Vaccaro, Naples, 1951). *Domenico Antonio Vaccaro*: Naples, 1681–1750, sculptor (N. F. Faraglia, Notizie di alcuni artisti che lavorarono nella chiesa di S. Martino sopra Napoli, Arch. storico per le prov. napoletane, XVII, 1892, pp. 657–78; R. Mormone, D. A. Vaccaro architetto, Napoli nobilissima, I, 1961, pp. 135–50; R. Mormone, Scultura di D. A. Vaccaro in San Paolo Maggiore, Napoli nobilissima, I, 1961, pp. 43–51). *Luigi Vanvitelli*: b. Naples, 1700; d. Caserta, 1773; architect [G. Chierici, La Reggia di Caserta, Rome, 1937; F. Fichera, Luigi Vanvitelli, Rome, 1937; G. R. Ansaldi and others, Vanvitelliana, Atti VIII Conv. naz. Storia Arch. (1953), Caserta, 1956, pp. 31–155; A. Ghidiglia Quintavalle, Luigi Vanvitelli e il Barocco, Florence, n.d.]. *Giovanni Vermexio* (*Vermescio*): architect in Syracuse, active during the first half of the 17th century (G. Agnello, L'opera di Giovanni Vermexio nel Palazzo del Senato a Siracusa, Arch. d'Italia, 2d Ser., XI–XVI, 1949, pp. 46–81; G. Agnello, I Vermexio: Architetti ispano-siculi del secolo XVII, Florence, 1959). *Francesco Zimbalo*: late-17th-century architect, Puglia (M. Manieri Elia, Il Barocco Salentino nel suo quadro storico: Gabriele Riccardi e Francesco Antonio Zimbalo, Atti IX Conv. naz. Storia Arch., Palermo, 1959, pp. 189–202).

THE VENETIAN SCHOOL IN THE 17TH AND 18TH CENTURIES. The glorious art of 16th-century Venice exercised a determining influence on baroque style, although Venice itself stagnated in this later period. Venetian art was a point of departure for some of the supreme representatives of the baroque, from the Carraccis to Rubens, and influenced the development of painting in Bologna, Rome, Naples, and Europe in general. Venetian architecture anticipated neoclassicism in the English Palladian movement; Venice supplied essential precedents for modern painting from Turner through impressionism.

For two centuries, the influence of Sansovino and Palladio was of prime importance for Venetian architects, the most important of whom was Baldassarre Longhena (q.v.), a student of Scamozzi. Longhena's Church of S. Maria della Salute (1631–81; II, PL. 141) was a masterpiece of scenographic grandeur, new to Venice in terms of ground plan and volume but firmly bound to the pictorial and atmospheric values of the Venetian artistic tradition. This is also true of Ca' Rezzonico (PL. 226; II, PL. 220) and Palazzo Pesaro. Longhena also designed the Church of the Scalzi (S. Maria di Nazareth), to which a façade was added in 1689 by Giuseppe Sardi of Ticino, who had earlier built the façade of S. Maria Zobenigo (1678–83). These façades and that of S. Moisè (by Alessandro Tremignon, 1668) illustrate the tendency of the period toward excessive ornamentation, which detracted from the architectural values of the buildings. In Verona there was a strict continuation of the style of Sanmichele in the work of his nephew and pupil Domenico Curtoni (Palazzo della Gran Guardia, begun 1610).

Early 18th-century Venice began to temper the baroque with classicistic motifs from the Palladian tradition, evidenced in the work of Andrea Tirali of Ticino (Church of S. Vitale) and Domenico Rossi (façade of S. Stae, ca. 1709; reconstruction of the Church of the Gesuiti, or S. Maria Assunta, 1715–29; Palazzo Corner della Regina, begun 1724). The structures of Antonio Gaspari (Caspari), such as S. Maria della Fava (1705), contain Borrominian schemata and motifs handled with a light touch. Giorgio Massari, who completed Gaspari's work in S. Maria della Fava, also designed the airy Church of the Gesuati (1725–36) and the restrained almost neoclassic Palazzo Grassi (now Stucky, ca. 1750). Clearly neoclassical was the work of Tommaso Temanza (Church of the Maddalena), Giovanni Antonio Selva (the theater La Fenice, 1792), who brought neo-Palladian forms back to Venice from England, and Calderari, who was especially active in the Vicenza area. The Bergamask Giacomo Quarenghi, who worked in St. Petersburg after 1779, also formed his style in Venice.

Venetian sculpture of the 17th century was dominated by the work of the Fleming Josse de Corte, a theatrical and virtuosic artist who went from Rome to Venice (altar figures for S. Maria della Salute, ca. 1670). Other masters, including such foreigners as the German Melchior Barthel, created ever heavier sculptural and architectural decorations, and only toward the end of the century did the pictorial sensitivity of Francesco Cabianca and Orazio Marinali revitalize Venetian sculpture. The leading wood sculptor about the end of the 17th and early 18th century was Andrea Brustolon of Belluno. The work of his pupil Giovanni Marchiori was lively, though marked by a rather academic grace. The elegant virtuosity of Antonio Corradini, who also worked in Naples, was admired in Germany, Vienna, and Prague. But the most representative 18th-century sculptor in Venice was Johann Maria (Giammaria) Morlaiter (Morleitner), whose work, especially the clay models (Venice, Mus. Correr; sculpture in the Gesuati), is marked by a lively spontaneity, elegance, and a pictorial vision parallel to that of contemporaneous painting. The young Canova was influenced by Morlaiter's style before turning to neoclassic ideals.

The return from Rome of the Caravaggesque painter Carlo Saraceni (II, PL. 183) might have revived Venetian painting if that painter had not died so soon (1620) after his arrival in Venice. The task of regeneration devolved upon non-Venetian artists, such as Johann Liss (Lys), a German who had studied in Holland. Liss went to Venice from Rome in 1622; the Roman Domenico Fetti went to Venice from Mantua in 1622; and Bernardo Strozzi of Genoa arrived in 1630. These artists, influence by Caravaggio and Rubens, painted in rich color and tended to translate sacred and mythological subjects into scenes of contemporary life or genre.

This new spirit was particularly evident in Francesco Maffei's rich bold touch and visionary exuberance and in the Florentine Sebastiano Mazzoni's free and luminous brush stroke, which prefigured 18th-century painting. Traditionalism, based on the style of Padovanino (Alessandro Varotari), was represented in 18th-century Venetian painting by Girolamo Forabosco and Giulio Carpioni, who was influenced by the classicistic trend as well. (The imitations of 16th-century style by Pietro Muttoni, known as Pietro della Vecchia, constitute a special case.)

The Franco-Fleming Nicolas Regnier (known in Italy as Niccolò Renieri) moved to Venice in 1626; his original Caravaggesque style was gradually modified by academic forms of Bolognese origin. The Lombard-Roman Pier Francesco Mola, who worked for a time in Venice, was also influenced by the Emilians. The influence of Pietro da Cortona appeared in Venice in the work of the Tuscans Giovanni Coli and Filippo Gherardi and the Paduan Pietro Liberi (an artist of affected sweetness who was active in Vienna and Germany), and most notably in that of the Roman Francesco Ruschi (Rusca) and the Genoese Giovanni Battista Langetti (Langhetti). In the typical chiaroscuro of Venetian art of the second half of the 17th century, the work of these men expressed a taste for violent naturalism. This tendency encountered the Neapolitan style, which was brought to Venice by Luca Giordano (three paintings in S. Maria della Salute) and affected such painters as Antonio Carneo, Antonio Zanchi, the German Johann Carl Loth, and later Antonio Molinari (Mulinari), the teacher of Piazzetta. Fumiani's large, architectural perspective paintings owed much to his Bolognese training; the flowing decorative effect of the paintings of Antonio Balestra, who continued to work in the first decades of the 18th century, also derived from the Bolognese school and from Maratta. The luminous ease of color of Andrea Celesti, who also worked in Austria, was an important forerunner of 18th-century painting. The famous portraitist Sebastiano Bombelli of Udine worked in Vienna and Munich.

The fact that many Venetian painters were called to work abroad corroborates Venice's new importance in 18th-century European art. Sebastiano Ricci (in Vienna, 1701–03; London, Paris, 1712–17) was the first of the new Venetian painters to work in a style that harmonized perfectly with the European rococo (PL. 227). His work marked a passage from an emphasis on chiaroscuro to one on color, a transformation complemented by the rediscovery of Paolo Veronese's handling of light. The international importance of Venetian art was enhanced by Giovanni Antonio Pellegrini, whose work was characterized by delicate color and broad, sparkling brush strokes. Pellegrini worked in England (1708–13), Germany, Holland, Paris (1720), Würzburg, Prague, Dresden, Vienna (1724–25), and Mannheim. Jacopo Amigoni, a Neapolitan born in Venice, carried his gallant, worldly style, suffused with Arcadianism and academicism, to Bavaria (Nymphenburg and Schleissheim; from 1711), England, Paris (1736–39), and Madrid (1747–52). Giovanni Battista Crosato, who worked in Turin (1730–36, 1740–42) as well as in Venice, contributed to the international diffusion of Venetian painting, as did Rosalba Carriera, who created portraits in pastels, a technique that was greatly admired in France.

Giovanni Battista Piazzetta (q.v.; PL. 222) is noteworthy among the painters of this generation who worked nearer to Venice. He started out in the style of the 17th-century Venetian "tenebrosi," acquired concrete dramatic force in Bologna under the direction of Crespi and the study of Guercino, and brightened his palette under the influence of Domenico Fetti and Liss. The style of Giovan Battista Tiepolo (q.v.), the foremost representative of courtly decorative painting, derived from Piazzetta, Ricci, Paolo Veronese, and the expressionism of Federico Bencovich (who was active in Vienna, 1716, and Wurzburg, 1733, and contributed to establishing the Venetian stamp of the Germanic rococo).

The style of such artists as Giovanni Battista Pittoni (PL. 227), a clever and elegant exponent of the international rococo style, Nicola (Giannicola) Grassi of Friuli, and Gaspare Diziani of Belluno was variously determined by the work of Ricci, Piazzetta, and Tiepolo. The last two were also followed by numerous minor artists. Francesco Capella (Daggiù), Domenico Maggiotto (Majotto), Giulia (Lisalba) Lama, and Giuseppe Angeli were among the disciples of Piazzetta; those of Tiepolo included Fabio Canal, Francesco Zugno, Jacopo Guarana, and the talented Francesco Fontebasso, who was initially influenced by Ricci and worked in St. Petersburg in 1760–61. Antonio Zuc-

chi, a modestly talented pupil of Fontebasso and Amigoni, worked in England (1770–82), where he married Angelica Kauffmann. Pietro Antonio Rotari of Verona, was court painter and portraitist in Vienna, Dresden, and St. Petersburg, where he died in 1762. The Veronese tradition survived in the school of Balestra and in the work of the Cignaroli family, of whom the most important was Gianbettino. Giovanni Antonio Guardi (q.v.), a contemporary of Tiepolo, adopted the clear, airy manner of Ricci and Pellegrini. Giovanni Antonio's younger brother and collaborator, Francesco Guardi, was a stronger artistic personality.

Pietro Longhi's (q.v.) scenes of contemporary life and the portraits of his son Alessandro were distinctly different from the decorative or "historic" art of the time. Giovanni Domenico Tiepolo, after departing from the style of his father, portrayed contemporary conditions with a lively and bitter spirit.

"Views" (*vedute*) or "landscapes" constituted another area of 18th-century Venetian painting, even though it was an imported genre, derived from Roman, Neapolitan, and Genoese art. Luca Carlevaris of Udine, following the models of Van Wittel, introduced the "view" to Venice. Canaletto (q.v.) brought the "view" to its highest expression and also interpreted English landscape with extraordinary intensity. Michele Marieschi, who was for a while a scene designer in Germany, successfully painted "composed" landscapes. In contrast, Bernardo Bellotto (q.v.), a nephew and pupil of Canaletto, created a style of concentrated reality and dense imagery. The disembodied vision of Francesco Guardi transfigured the elements of the landscape into pure imaginative values of light and atmosphere. The genre of landscape painting had been initiated in Venice by Marco Ricci, who studied with his uncle Sebastiano (whom he followed to London, Holland, and Paris) and was influenced by the art of Pannini, Rosa, and Magnasco. The preromantic force of Ricci's work was transformed into Arcadian insubstantiality by the Tuscan Francesco Zuccarelli, who went to Venice from Rome and then traveled through England, France, Holland, and Germany. The two diverse tendencies converged in the landscapes of Giuseppe Zais of Belluno.

The assimilation of Venetian painting to neoclassic style in the first decades of the 19th century devolved upon Johann Baptist II Lampi (Lamp) of Trent, a courtly portraitist who studied in Verona and Austria, worked in Poland (1788) and Russia (1791), and finally settled in Vienna.

REGIONAL SCHOOLS OF NORTHERN ITALY. *Lombardy from the mannerist period to the end of the 18th century.* The Duchy of Milan, which came under Spanish domination in 1535, was formally united in 1555 to the Spain of Philip II, as were other Italian dominions. Lombard art of this period, particularly that of Milan, was characterized by the didactic moralism typical of the Counter Reformation and comparable to contemporaneous Spanish manifestations. Perhaps more important for this tendency than the mere political situation was the influence exercised on the arts, and culture in general, by Cardinal Federigo Borromeo.

Lombard mannerism was epitomized by the painter and theoretician Giovanni Paolo Lomazzo and his pupil Ambrogio Giovanni Figino. In sculpture the influence of Michelangelo was transmitted through the composite style of Leone Leoni. Leoni, whose father was Tuscan, was both a sculptor and medalist (PL. 215). The influence of Michelangelo was also brought to Lombardy by the Tuscan Stoldo Lorenzi and particularly influenced Annibale Fontana. Other Lombards, such as the Della Portas and Fontanas, went elsewhere to practice their sculpture, especially to Rome.

Mannerist architecture in Milan owed much to Galeazzo Alessi of Perugia, who went to Milan from Genoa to design the Palazzo Marino and the Church of S. Maria presso S. Celso (PL. 215), and to Pellegrino Tibaldi, author of the Church of S. Fedele and of work for the Palazzo Arcivescovile. Vicenzo Seregni (Palazzo dei Giureconsulti, 1564) and Martino Bassi, who continued the tradition of Alessi and Tibaldi, were also noteworthy. The local tradition of rich, plastic decoration influenced the development of architecture and was characteristically manifested in the stuccowork of many churches.

The evolution of the baroque from mannerism in Lombardy was effected easily because of the severity of the architecture of the first half of the 17th century. This early 17th-century architecture included the work of Fabio Mangone, Federigo Borromeo's architect (Collegio Elvetico, now Palazzo del Senato, begun in 1608), and the less severe work of Francesco Maria Ricchino, who built the Church of S. Giuseppe (1607–30) and the Palazzo di Brera (II, PL. 145). The courtyard of the Palazzo di Brera also demonstrated the continued affinity between the architecture of Milan and Genoa, both much affected by the work of Alessi.

The rococo spirit smoothly followed on baroque simplicity, and was especially evident in certain palaces in Milan, Brescia, and Cremona, the many beautiful villas on the lakes, and in Brianza and the region north of Brescia. Finally, the 18th century produced the clear simplicity of neoclassicism, primarily through the work of Giuseppe Piermarini of Foligno, who arrived in Milan in 1769.

In a typical manifestation of the Lombard baroque, sculpture and painting were combined in the scenographic realism of the decoration of the chapels leading up to the Sacro Monte in Varese (1604–80), where, among others, Dionigi Bussola and Giuseppe Rusnati created sculptural decorations and Nuvolone and Morazzone painted. Even in the baroque period, the workshops of the Cathedral of Milan remained the centers of Lombard sculpture. Lombard painting of the 17th century was initiated by the Bolognese Procaccini family, of whom Giulio Cesare, younger brother of Camillo, was the most significant artist. Giulio Cesare Procaccini was notable for the hedonistic quality of his conceptions, derived from his study of Correggio and Parmigianino (PL. 215; II, PL. 198). This Emilian influence merged with the traditional luminism of Lombard art and influences transmitted by Genoa (Rubens, and later, Van Dyck) to create the particular qualities of a somewhat academic art, which was hedonistic beneath its veil of piety and sometimes psychologically realistic in its taste for martyrdoms (of St. Francis, by Morazzone, Milan, Mus. del Castello Sforzesco) and unusual effects (Herodias, by Francesco del Cairo, Vicenza, Mus. Civ.). Giovanni Battista Crespi (called "Cerano") nobly expressed his dramatic and decorative sense through the use of warm color with broad contrasts in composition and light. Elements of Gaudenzio Ferrari's art survived in the decorative exuberance of Morazzone (Pier Francesco Mazzucchelli), whose tortured effects of light influenced Magnasco. In portraiture, Carlo Francesco Nuvolone of Cremona achieved an academic pleasantness with a softly eclectic style. Conversely, Daniele Crespi was interesting for a severe realism that approximated Spanish style, recalling Velázquez and Zurbarán. The portraits of the Bergamask Carlo Ceresa, Crespi's pupil, were in-

tensely objective, as were the still lifes of the Bergamask Evaristo Baschenis, whose visual clarity was worthy of a Dutch master.

Attention to reality was a traditional quality of painting in Bergamo from the time of Moroni to the 18th century. The person portrayed was rendered with concrete immediacy, as seen in the work of Fra Galgario (Vittore Ghislandi), a pupil of Sebastiano Bombelli in Venice. Even more severe was the humble "truth" of the poor people depicted by Giacomo Ceruti of Brescia.

The environment of Milan, where he worked for many years, contributed many elements to the art of the Genoese Alessandro Magnasco (q.v.). His lashing brush strokes flashed over the surfaces of his visionary conceptions, depicting certain aspects of the life of his time in a manner between the caustic and the semitragic and rendering landscapes with high pictorial intensity. Magnasco's art was partly based on the prints of Callot (friars, gypsies, maskers, vagabonds, feasts). In Mantua, the 17th-century examples of Rubens and Fetti contributed to the mannerist elegance of Giuseppe Bazzani, whose nervous brush stroke produced luminous effects that recalled the Venetians.

Arfelli, Per la cronologia dei Procaccini, Arte antica e moderna, II, 1959, pp. 457–61). *Francesco Maria Ricchino*: Milan, 1584–1658, architect (P. Mezzanotte, Apparati architettonici del Richino per nozze auguste, Rass. d'arte, XV, 1915, pp. 224–28; M. L. Gengaro, Dal Pellegrino al Richino: Costruzioni lombarde a pianta centrale, BArte, XXX, 1936, pp. 202–06; E. Cattaneo, Il San Giuseppe del Richini, Milan, 1957). *Vincenzo Seregni*: Milan, ca. 1504–94, architect (C. Baroni, Gli edifici di Vincenzo Seregni nella Piazza dei Mercanti a Milano, Milan, 1934; C. Baroni, Intorno a tre disegni milanesi per sculture cinquecentesche, RArte, XX, 1938, pp. 392–410). *Todeschini* (*Giacomo Francesco Cipper*): 18th-century painter (W. Arslan, Del Todeschini e di qualche pittore affine, L'Arte, N.S., IV, 1933, pp. 255–73; M. Mojzer, Giacomo Francesco Cipper, Acta historiae artium, IV, 1956, pp. 77–98).

Piedmont. The art of Piedmont acquired distinctive characteristics only during the baroque period. Until then, the artistic needs of this small border state were limited and were sufficiently satisfied by imported works and by local elaborations of Lombard and French influences. Thus Romanesque architecture in Piedmont, which was based on Lombard style, absorbed Burgundian and Provençal elements, as in the 12th-century Abbey of S. Maria in Vezzolano and the Abbey of Cavagnola. The work of Antelami in S. Andrea in Vercelli at the beginning of the 13th century confirmed these cultural sources (I, pl. 297; VI, pl. 332). Piedmont almost completely missed the stylistic phase of the Renaissance. (The Cathedral of Turin, 1491–98, by Meo del Caprino of Settignano, is an exception.) This absence of one of the most significant developments of Italian art gave a nonclassic, northern character to Piedmontese art, which evolved directly from the Gothic to the baroque. Particularly interesting creations include the famous castles of the feudal period; the frescoes in the Castello della Manta (VI, pl. 64) and those executed by Jacquerio in the Abbey of S. Antonio in Ranverso were manifestations of the elegant style of 15th-century International Gothic.

As Lombard and French influences were important for Romanesque architecture in Piedmont, so in painting they affected two early 16th-century Piedmontese artists, Giovanni Martino Spanzotti and his pupil Defendente Ferrari. These men reflected the Renaissance, but only indirectly, by way of the work of the Lombard Foppa. Spanzotti and Ferrari were also clearly in contact with French art, and their work was undoubtedly more coherent than that produced by Macrino d'Alba's (Gian Giacomo de Alladio) eclectic derivations from the art of central Italy. Sodoma (q.v.) and Gaudenzio Ferrari left Vercelli to participate in the broader movements of Italian painting, while Gerolamo Giovenone, who continued to paint after the middle of the 16th century, remained a provincial artist. But from the province of Vercelli came the most important

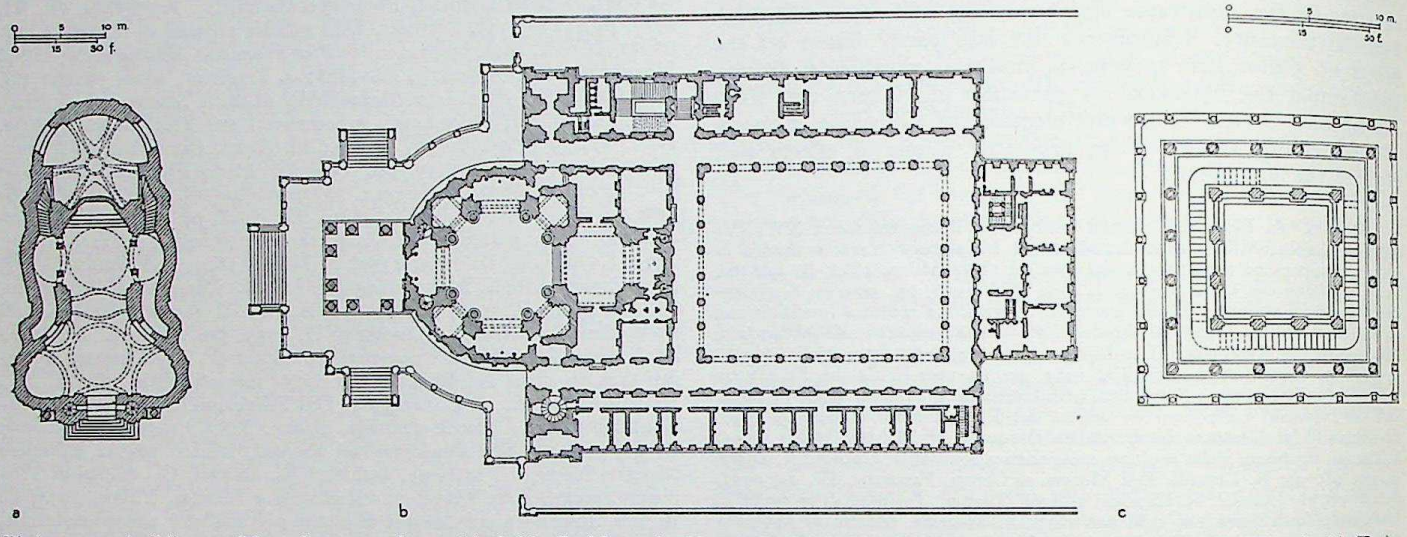
Piedmontese painter of the period from the end of the 16th to the beginning of the 17th century, Tanzio da Varallo (Antonio d'Enrico Tanzio). His early artistic training was in the tradition of Lombard mannerism, but he was influenced by the style of Caravaggio after a trip to Rome about 1615 (frescoes in Novara, S. Gaudenzio).

In the second half of the 16th century, under Emmanuel Philibert (who oriented Piedmontese politics toward Italy), and later under Charles Emmanuel I (duke from 1580 to 1630), Piedmont experienced a notable artistic revival, which was responsible for the urban development of the city of Turin. The first concern was military, and in 1564 Francesco Conte Paciotti (Pacciotto) of Urbino was called to construct the citadel of Turin. By 1577, however, the Church of the SS. Martiri had been begun, after a design of Pellegrino Tibaldi. The most active architects in Piedmont at this time were Ascanio Vittozzi of Orvieto, Carlo di Castellamonte, and Amedeo di Castellamonte. Ascanio Vittozzi opened new streets and designed squares (e.g., Piazza Castello, 1584), churches (e.g., Corpus Domini, 1609), and villas (e.g., Villa della Regina and its park). Carlo di Castellamonte provided plans for the beautiful Piazza S. Carlo, which was constructed in 1640, just after the artist's death. His son, Amedeo di Castellamonte, continued his work with the uniform sobriety and correctness evident in the structure of the Royal Palace (begun in 1646), the Via Po, the Ospedale of S. Giovanni, and the hunting lodge of Venaria Reale. Minor architects of the time included Maurizio Valperga and Francesco Lanfranchi, whose work was overshadowed by the vast production of Guarino Guarini (q.v.), who worked in Turin from 1668.

In 1714, Victor Amadeus II made Filippo Juvara (q.v.) of Messina first architect of his court (FIG. 467). Juvara's style, marked by a refined elegance of modeling and pictorial spatial effects, raised the quality of Turin's architecture to the level of the leading 18th-century European courts. The façade of the Palazzo Madama (PL. 226) and the royal hunting lodge of Stupinigi (I, PLS. 389, 407; II, PL. 141) are particularly noteworthy. After Juvara, the two leading 18th-century architects in Piedmont were Benedetto Alfieri and Bernardo Antonio Vittone. Alfieri's style was halfway between that of Guarini and that of Juvara (Alessandria, Palazzo Ghilini, 1730; Turin, Royal Palace, decoration; Carignano, S. Giovanni Battista, 1757–71); Vittone sought complex rococo effects in the tradition of Borromini and Guarini (Bra, S. Maria degli Angeli, 1742; Turin, S. Maria di Piazza, 1751). Such minor architects as Gian Giacomo Planteri, Carlo Filippo Aliberti, and Dellala (Count Francesco Valeriano Dellala di Bernasco) designed churches, palaces, and villas that contributed a particular Piedmontese stamp to the local architecture of this period. This architecture also derived characteristics from painters and other artists (including stuccoworkers and wood carvers), whose styles were extensively influenced by France. The sculpture of the period was of mediocre quality. Among the representative painters were the Venetian Giovanni Battista Crosato (who created decorations for the Royal Palace, the Villa della Regina, Stupinigi, and the Consolata), Claudio Francesco Beaumont of Turin (the vault of the Galleria dell'Armeria, Royal Palace, 1744), and the Frenchman Charles André van Loo (frescoes at Stupinigi), a pupil of his brother Jean Baptiste, who worked in the Castello di Rivoli. Numerous Romans, Neapolitans, Genoese, and Venetians were also commissioned to decorate the new churches and palaces in Piedmont. The Venetian group was especially important and included, besides Crosato, two or three members of the Cignaroli family and Francesco Trevisani (called "Romano"). Trevisani had been Beaumont's master in Rome. This union of Venetian art with the brilliant superficial art of Van Loo established 18th-century painting in Piedmont as one of the expressions of the European rococo.



Piedmontese buildings, 18th–19th cent., plans. (*a*) Agliè, S. Marta (architect: C. Michela); (*b*) Superga, Basilica (architect: F. Juvara); (*c*) Turin, Mole Antonelliana (architect: A. Antonelli).

Liguria. The artistic development of Lombardy, Piedmont, and Liguria was connected by common elements, reciprocity of influence, and exchanges of artists. Liguria's cultural range was broader than that of Piedmont, as evidenced in Liguria's Romanesque architecture, which joined Tuscan and Byzantine elements to Lombard and French qualities (Noli, S. Paragorio; San Fruttuoso, Monastery of S. Fruttuoso di Capodimonte; Genoa, S. Donato and S. Maria di Castello). Gothic features began to appear early in Liguria, but Gothic structures retained some traditional Romanesque elements, including dichromatic ornamentation. These characteristics and French influences (13th–14th cent.) marked the conception of Genoa Cathedral (S. Lorenzo) and appeared in secular structures (Genoa, Palazzo di S. Giorgio; the Doria houses in Piazza S. Matteo) even into the 15th century. This late Gothic style represented the taste of the entire region, which, like Piedmont, did not really experience the Renaissance (despite the fact that Alberti was born in Genoa). Even in the Genoese work of the Lombards Domenico Gaggini and his nephew Elia, architecture and sculpture were combined to achieve a decorative effect that properly belonged to the so-called "flamboyant" style (Genoa, Cathedral, Chapel of S. Giovanni Battista, ca. 1456), although some Tuscan elements did appear in their work.

In the 13th–14th century many Tuscan painters did work for Genoa, from Manfredino d'Alberto (Manfredino da Pistoia) to Taddeo di Bartolo. Barnaba da Modena worked extensively in Liguria in the period 1360–80; the Byzantine Gothicism he brought to Genoa was accompanied by the delicacies of Po Valley chiaroscuro, which were revived in the 15th century in the art of Vincenzo Foppa (q.v.). Foppa worked in Genoa and Savona, where he collaborated with Ludovico Brea on the polyptych (1489–90) of the Church of S. Maria di Castello. Brea was the outstanding painter of a group that created the first local style of painting in Nice. Franco-Flemish tradition was strong in this school, which was related to the art of Catalonia and Sicily by certain characteristics found throughout the Mediterranean area. The work of Carlo di Giovanni Braccesco (known as Carlo da Milano), who worked in Liguria (Imperia, Genoa), also displayed elements derived from Flemish art and the work of Foppa.

The 16th century marked the beginning of Genoa's artistic efflorescence. Mannerism came to Genoa in the work of Giovanni Angelo Montorsoli (Palazzo Doria Pamphili), Perino del Vaga, Beccafumi, and Giambologna (q.v.; bronze figures and reliefs for the Grimaldi Chapel, ca. 1579–85, now in the University of Genoa). But it was chiefly Galeazzo Alessi (active in Genoa ca. 1548–60) who brought to Genoa the developments of the Roman 16th century (subtly animated with elements drawn from Sebastiano Serlio) and thereby established the basis for the picturesque, scenographic luminism of contemporaneous Genoese architecture (S. Maria Assunta di Carignano, 1552; FIG. 419; Villa Cambiaso and Villa Pallavicino delle Peschiere; the former Palazzo Cambiaso, now Banco di Napoli; Palazzo Parodi). The intensive building activity of this period, which saw the opening of the noble Via Nuova (or Via Maggiore, later called Via Garibaldi), produced the famous Genoese palaces with airy loggias and staircases. Two Lombard architects who followed the lead of Alessi in these activities were Giambattista Castello, who was also a painter (Palazzo Carrega-Cataldi, begun 1558; Palazzo Podestà; Palazzo Doria, 1564), and Rocco Lurago (Palazzo Comunale, II, PL. 144; FIG. 417). Another Lombard, Baccio Bartolommeo del Bianco, was the principal architect of Genoa in the 17th century (Via Balbi; Durazzo-Pallavicini and Balbi-Senarega palaces, and Palazzo dell'Università, 1615–38); he created clear scenographic impressions, which harmoniously blended his structures with their surroundings. The Genoese tradition was continued in the 18th century by Gregorio Petondi, architect for the Palazzo Balbi (1780; PL. 226).

Sculpture, which was of little importance up to the middle of the 17th century, acquired a certain significance in the work of Pierre Puget of Marseilles, who worked in Genoa from 1661 to 1667 (sculptures in S. Maria Assunta di Carignano, II, PL. 170; statue of the Virgin of the Immaculate Conception, Oratory of S. Filippo Neri), and in that of the Genoese Filippo Parodi, who also worked in Venice and Padua. Parodi assimilated the influence of Bernini and Algardi in a style of pictorial theatricality that had psychological overtones. Parodi's son Domenico and the brothers Bernardo and Francesco Schiaffino (*Rape of Prosperine*, Genoa, Royal Palace) handled sculpture with decorative ease and were also admired abroad.

But Ligurian art found its highest expression in the exuberance of its baroque painting. The greatest Genoese painter of the 16th century was Luca Cambiaso (IX, PL. 302), a pupil of his father Giovanni and of Giovanni Battista Castello. Luca, a mannerist of rich imagination, was an originator of the local tradition of mural decoration. Even after the time of Beccafumi, Sienese art continued to influence that of Genoa. The visits of Rubens and Van Dyck were of fundamental importance to 17th-century Genoese painting. From these painters the local artists derived their fine intense color, evident, for example, in the work of Andrea Ansaldo and in that of Bernardo Strozzi (II, PL. 202), who emigrated to Venice in 1630. The work of Gioacchino Assereto, a pupil of Ansaldo, occasionally approached the tones of French art or of Neapolitan work after Caravaggio. The tendency to treat pictorial subjects as realistic or "genre" scenes achieved fine results in the work of Giovanni Benedetto Castiglione, known as Grechetto. An excellent engraver and an admirer of Rembrandt, Grechetto was influenced by Flemish and Venetian art. As a painter of animals, Castiglione was preceded by Sinibaldo Scorza and followed by Anton Maria Vassallo. Giovanni Andrea de' Ferrari and Domenico Fiasella, students of the late mannerist Bernardo Castello, still interpreted their "historical" subjects in a realistic manner, although their work evidenced a somewhat superficial and academic eclecticism. The portraitist Giovanni Bernardo Carbone was strongly influenced by Van Dyck.

There was another trend in Genoese painting, that of the great decorators who frescoed the vaults of churches and palace salons and galleries. Taddeo Carlone's sons, Giovanni Andrea and Giovanni Battista, continued the tradition of Cambiaso and Giovanni Battista Castello. But the most vital representatives of this Genoese decorative painting were Valerio Castello (son of Bernardo), Domenico Piola, and Gregorio de' Ferrari.

UP State Museum, Lucknow

Castello was receptive to the hedonism of Correggio, Giulio Cesare Procaccini, Rubens, and Van Dyck; Piola's numerous works were characterized by a joyful brilliance; and De' Ferrari continued these pleasant qualities into the 18th century (II, PL. 201). Giovanni Battista Gaulli (known as Bacciccio or Baciccia) went to Rome in 1657, at the age of eighteen. The masterpiece of his daring imagination was the ceiling fresco of the Church of the Gesù in Rome (II, PL. 171). Mulinaretto (Giovanni Maria dalle Piane), who was in contact with Gaulli during a period of study in Rome, was an elegant portraitist in the ornate tradition of contemporary French and English artists. Mulinaretto later became court painter in Naples (1730–41). Quite different was the painting of Magnasco (q.v.), whose extended stay in Milan as a young man produced an art that was more Milanese than Genoese in character.

ARTISTS. *Andrea Ansaldo*: b. Voltri, 1584; d. Genoa, 1638; painter (E. Hoffmann, Verlorene Dürerzeichnungen und einige italienische Zeichnungen . . ., Jhb. Mus. der bild. K. in Budapest, X, 1940, pp. 17–23). *Gioacchino Assereto*: Genoa, 1600–49, painter (R. Longhi, L'Assereto, Dedalo, VII, 1926–27, pp. 355–77; R. Longhi, E ancora dell'Assereto, Pinacoteca, I, 1928–29, pp. 221–25; L. Grassi, Deposizione inedita dell'Assereto, Paragone, III, 31, 1952, pp. 40–42; G. F. Castelnovi, Intorno all'Assereto, Emporium, CXX, 1954, pp. 17–35). *Carlo di Giovanni Braccesco* (called *Carlo da Milano*): doc. 1451–1501, painter (R. Longhi, Carlo Braccesco, Milan, 1942; F. Zeri, Two Contributions to Lombard Quattrocento Painting, BM, XCVII, 1955, pp. 74–77). *Ludovico Brea*: Nice, ca. 1450–1523, painter (L. H. Labande, Les Brea: Peintres niçois des XV[e] et XVI[e] siècles en Provence et en Ligurie, Nice, 1937; L. H. Labande, Louis Brea, GBA, XVIII, 1937, pp. 73–92, 143–60). *Luca Cambiaso*: b. Moneglia (Genoa), 1527; d. Madrid, 1585; painter (B. and W. Suida, Luca Cambiaso, Milan, 1958; L. Collobi Ragghianti, Il magistrale Luca Cambiaso, CrArte, N.S., VI, 1959, pp. 166–84). *Giovanni Bernardo Carbone*: Albaro (Genoa), 1614–83, painter (O. Grosso, Giovanni Bernardo Carbone, Dedalo, VIII, 1927–28, pp. 109–34). *Carlone*: family of painters of Lombard origin, active in Genoa from the 2d half of the 15th century, of whom the best known are *Giovanni Battista*, b. Genoa, 1592; d. Turin, 1677; and *Giovanni Andrea*, Genoa, 1639–97 (M. Marangoni, I Carlone, Florence, 1925). *Bernardo Castello*: b. Albaro (Genoa), 1552; d. Genoa, 1629; painter (M. V. Brugnoli, Il soggiorno a Roma di Bernardo Castello e le sue pitture nel palazzo di Bassano di Sutri, BArte, XLII, 1957, pp. 255–65). *Valerio Castello*: Genoa, 1625–59, painter (M. Labò, Valerio Castello, Emporium, XCVI, 1942, pp. 369–78; B. Riccio, Contributo a Valerio Castello, Comm, VIII, 1957, pp. 39–46). *Giovanni Benedetto Castiglione*, called *Grechetto*: b. Genoa, 1610(?); d. Mantua, 1665; painter (G. Delogu, Giovanni Benedetto Castiglione detto il Grechetto, Bologna, 1928; A. Blunt, A Poussin-Castiglione Problem, Warburg, III, 1939–40, pp. 142–47; A. Blunt, The Drawings of Giovanni Benedetto Castiglione and Stefano della Bella . . . at Windsor Castle, London, 1954). *Giovanni Andrea de' Ferrari*: 1598–1669, painter (P. Rotondi, Contributo a Giovanni Andrea de' Ferrari, BArte, XXXVI, 1951, pp. 280–83; E. Falletti, Inediti giovanili di Giovanni Andrea de' Ferrari e proposte per una cronologia, Comm, VII, 1956, pp. 158–69; A. M. Goffredo, Per la conoscenza di Giovanni Andrea de' Ferrari, Comm, VII, 1956, pp. 147–57). *Gregorio de' Ferrari*: b. Porto Maurizio, 1644; d. Genoa, 1726; painter (J. De Masi, La vita e le opere di Gregorio de' Ferrari, Genoa, 1945; A. Griseri, Per un profilo di Gregorio de' Ferrari, Paragone, VI, 67, 1955, pp. 22–46). *Domenico Fiasella*: b. Sarzana, 1589; d. Genoa, 1669; painter (W. Suida, Ein Bild des Domenico Fiasella in Wien, Belvedere, II, 1922, pp. 78–80). *Giovanni Battista Gaulli*, called *Bacciccio* (*Baciccia*): b. Genoa, 1639; d. Rome, 1709; painter (M. V. Brugnoli, Disegni del Baciccio, ArtiFig, I, 1945, pp. 49–54; M. V. Brugnoli, Contributi a Giovan Battista Gaulli, BArte, XXXIV, 1949, pp. 225–39; R. Enggass, Gaulli's Late Style, 1685–1709, AQ, XX, 1957, pp. 2–16). *Filippo Parodi*: Genoa, 1630–1702, sculptor (P. Rotondi, Filippo Parodi maestro dell'intaglio, BArte, XLIV, 1959, pp. 46–56; P. Rotondi, La prima attività di Filippo Parodi, Arte antica e moderna, II, 1959, pp. 63–73). *Domenico Piola*: Genoa, 1628–1703, painter (G. V. Castelnovi, I dipinti dell'Oratorio di S. Giacomo della Marina a Genova, Genoa, 1953; J. Bean, Un groupe di dessins génois, RArts, VIII, 1958, pp. 267–72). *Sinibaldo Scorza*: b. Voltaggio, 1589; d. Genoa, 1631; painter (K. T. Parker, Sinibaldo Scorza, Old Master Drawings, I, 1926–27, pp. 51–54). *Semino*: family of 16th-century Genoese painters, including *Andrea*, ca. 1525–ca. 1595 and *Ottavio*, ca. 1520–1604 (L. Ragghianti Collobi, Andrea Semino disegnatore, CrArte, N.S., I, 1954, pp. 133–43). *Bernardo Strozzi*: b. Genoa, 1581; d. Venice, 1664; painter (A. M. Matteucci, L'attività veneziana di Bernardo Strozzi, Arte veneta, IX, 1955, pp. 138–54; L. Mortari, Su Bernardo Strozzi, BArte, XL, 1955, pp. 311–33; I. Fenyö, Contributo ai rapporti artistici tra Palma Giovane e Bernardino Strozzi, Acta historiae artium, V, 1958, pp. 143–55). *Anton Maria Vassallo*: 17th-century painter (O. Grosso, Anton Maria Vassallo e la pittura d'animali nei primi del '600 a Genova, Dedalo, III, 1922–23, pp. 502–22; G. Delogu, Pitture italiane del '600 e del '700 a Vienna, L'Arte, N.S., VIII, 1937, pp. 222–41).

THE NINETEENTH CENTURY. The neoclassic period (see NEOCLASSIC STYLES) was followed by a general decline in the figural arts. Italian art assumed a marginal, almost isolated position, in relation to European art in general. However, distinct stylistic and regional groups continued to exist.

In Rome, after Valadier, architecture underwent a puristic phase in the work of Luigi Poletti, followed by a period of eclecticism in the structures of Gaetano Koch (1849–1910), Pio Piacentini (1846–1928), Guglielmo Calderini (1840–1916), Giuseppe Sacconi (1853–1905; X, PL. 157) and others. The work of these architects is interesting and constituted the first adaptation of the ancient city to its role as capital of Italy. In painting, the Roman neoclassicism of Felice Giani (Gianni), Vincenzo Camuccini, and Bartolomeo Pinelli was followed by the purism of such artists as Pietro Tenerani and Tommaso Minardi. The sculptors active in Rome felt the influences of tradition, purism, and the new realistic trends.

In Tuscany, the verism of the sculptors Lorenzo Bartolini, Giovanni Dupré, and Adriano Cecioni constituted a definite regional school of sculpture. In painting, Tuscany was the home of the Macchiaioli (q.v.), who produced the most vital expression of 19th-century painting in Italy.

In Naples the anti-academic reaction was characterized by the sculpture of Vincenzo Gemito and, in painting, by the so-called "school of Posillipo," dominated by Giacinto Gigante. Later masters of the Neapolitan school were Filippo Palizzi, Domenico Morelli, Gioacchino Toma, Antonio Mancini, and Giuseppe De Nittis (the last-named in contact with the Macchiaioli and the impressionists).

Lombard art was also distinguished by some particular characteristics. The architects Giuseppe Mengoni and Giuseppe Sommaruga worked in Milan, and Alessandro Antonelli worked in Turin, but their architecture, unlike the other arts, did not assume a distinctly regional flavor. There was, instead, a parallel between the development of regional sculpture and painting in this period. Thus, the pictorial inclination of the sculpture of Vincenzo Vela and Giuseppe Grandi culminated in the impressionistic creations of Medardo Rosso. In painting, after the work of the romantic Francesco Hayez, there was a second period of romanticism (represented by the work of Domenico and Gerolamo Induno, Giovanni Carnevali, called Piccio, and Federico Faruffini), which terminated in a style influenced by the mid-19th century literary movement known as the *scapigliatura lombarda*. The chief exponents of this style in painting were Tranquillo Cremona and Daniele Ranzoni. The last phase of 19th-century Lombard art was represented by the divisionist painting style of Gaetano Previati and Giovanni Segantini, which marked the extreme development of the *scapigliatura* and was similar to the development of the French pointillists.

In Turin, the dominant personality was that of the painter Antonio Fontanesi. In Venice, the leading artists were Giacomo Favretto, Guglielmo Ciardi, and Pietro Fragiacomo. Other isolated personalities of 19th-century Italian art were Francesco Paolo Michetti from the Abruzzi and Armando Spadini.

The first real break with tradition occurred in the work of Antonio Sant'Elia (I, PL. 408) and the futurists (see CUBISM AND FUTURISM), and Italy again began to participate more intimately in the broad development of European art (see EUROPEAN MODERN MOVEMENTS).

ARTISTS. *Andrea Appiani*: Milan, 1754–1817, painter (G. Bergamaschi, Le opere di Andrea Appiani pittore, Milan, 1849). *Lorenzo Bartolini*: b. Savignano, 1777; d. Florence, 1850; sculptor (M. Tinti, Lorenzo Bartolini, 2 vols., Rome, 1936). *Michele Cammarano*: Naples, 1835–1920, painter (M. Biancale, Michele Cammarano, Milan, 1936). *Vincenzo Camuccini*: Rome, 1771–1844, painter (P. E. Visconti, Notizie intorno alla vita del Barone Vincenzo Camuccini pittore, Rome, 1845). *Luigi Canina*: b. Casale Monferrato, 1795; d. Florence, 1856; architect (G. Bendinelli, Luigi Canina: Le opere e i tempi, Alessandria, 1953). *Giovanni Carnevali*, called *Piccio*: b. Montenegrino Luino, 1804; d. Caltaro sul Po, 1873; painter [C. Caversazzi, Giovanni Carnevali detto il Piccio, 3d ed., Bergamo, 1946; M. Valsecchi, Giovanni Carnevali (exhibition cat.), Varese, 1952]. *Bernardo Celentano*: b. Naples, 1835; d. Rome, 1863; painter (M. Biancale, Bernardo Celentano, Rome, 1936). *Tranquillo Cremona*: Pavia, 1837–78, painter (A. Neppi, Tranquillo Cremona, Rome, 1931; G. Nicodemi, Tranquillo Cremona, Milan, 1933). *Giuseppe De Nittis*: b. Barletta, 1846; d. Saint-Germain-en-Laye, 1884; painter (E. Piceni, Giuseppe De Nittis, Rome, 1932). *Giovanni Dupré*: b. Siena, 1817; d. Florence, 1882; sculptor (G. Rosadi and others, Giovanni Duprè, Milan, 1917). *Federico Faruffini*: b. Sesto San Giovanni, 1831; d. Perugia, 1869; painter and engraver (P. M. Bardi, Federico Faruffini, Milan, 1934). *Giacomo Favretto*: Venice, 1849–87, painter (D. Valeri, Giacomo Favretto, Venice, 1950). *Antonio Fontanesi*: b. Reggio Emilia, 1818; d. Turin, 1882; painter and engraver (C. Carrà, Fontanesi, Rome, 1924; M. Bernardi, Antonio Fontanesi, Milan, 1933; G. Briganti, Catalogo della retrospettiva di Antonio Fontanesi, Reggio Emilia, 1949). *Vincenzo Gemito*: Naples, 1852–1929, sculptor (O. Morisani, Vita di Gemito, Naples, 1936; E. Somarè and A. Schettini, Gemito, Milan, 1946; P. Bellonzi and R. Frattarolo, Appunti sull'arte di Gemito, Rome, 1952). *Giacinto Gigante*: Naples, 1806–76, painter (S. Ortolani, Giacinto Gigante, Bergamo, 1930; M. Limoncelli, Giacinto Gigante, Naples, 1934; S. Ortolani, La scuola di Posillipo, Bergamo, 1934; R. Causa, Acquarelli di Giacinto Gigante, Naples, 1955; A. Schettini, Giacinto Gigante, Naples, 1956). *Emilio Gola*: Milan, 1851–1923, painter (P. M. Bardi, Emilio Gola, Bergamo, 1930; R. Taccani and G. Nicodemi, Mostra celebrativa di Emilio Gola, Milan, 1956). *Francesco Hayez*: b. Venice, 1791; d. Milan, 1882; painter (F. Hayez, Le mie memorie, Milan, 1890; G. Nicodemi, Dipinti di Francesco Hayez, Milan, 1934). *Induno*: *Domenico*, Milan, 1815–78, and *Gerolamo*, Milan, 1827–90, painters (G. Nicodemi, Domenico e Girolamo Induno, Milan, 1945). *Antonio Mancini*: Rome, 1852–1930, painter (V. Guzzi, Antonio Mancini, Rome, 1943; F. Bellonzi and C. Lorenzetti, Antonio Mancini, Rome, 1953; A. Schettini, Antonio Mancini, Naples, 1953). *Giuseppe Mengoni*: b. Fontanelice (Bologna), 1829; d. Milan, 1877; architect (G. Ricci, La vita e le opere dell'architetto Giuseppe Mengoni, Bologna, 1930). *Francesco Paolo Michetti*: b. Tocco Casauria (Chieti), 1851; d. Francavilla a Mare, 1929; painter (T. Sillani, Francesco Paolo Michetti, Milan, 1932). *Tommaso Minardi*: b. Faenza, 1787; d. Rome, 1871; painter (I. Faldi, Il Purismo e Tommaso Minardi, Comm, I, 1950, pp. 238–46). *Domenico Morelli*: Naples, 1826–1901, painter (A. Conti, Domenico Morelli, Naples, 1927; V. Spinazzola, Domenico Morelli, Rome, Milan, 1927). *Filippo Palizzi*: b. Vasto, 1818; d. Naples, painter (A. Mezzetti, Contributi alla pittura italiana dell'800, BArte, XL, 1955, pp. 244–58, 334–45). *Bartolomeo Pinelli*: Rome, 1781–1835, painter and sculptor (V. Mariani, Bartolomeo Pinelli, Rome, 1948). *Gaetano Previati*: b. Ferrara, 1852; d. Lavagna, 1920; painter (V. Pica, Gaetano Previati, Bergamo, 1912; N. Barbantini, Gaetano Previati, Milan, 1919; V. Costantini, Gaetano Previati, Bergamo, 1931). *Daniele Ranzoni*: Intra, 1843–89, painter (C. Carrà, Ranzoni, Rome, 1924; R. Giolli, Ranzoni, Milan, 1926; M. Sarfatti, Daniele Ranzoni, Rome, 1935). *Medardo Rosso*: b. Turin, 1858; d. Milan, 1928; sculptor (A. Soffici, Medardo Rosso, Florence, 1929; G. Papini, Medardo Rosso, Milan, 1940; M. Borghi, Medardo Rosso, Milan, 1950). *Giovanni Segantini*: b. Arco, 1858; d. Engadine, 1899, painter [F. Servaes, Giovanni Segantini: Sein Leben und sein Werk, Leipzig, 1920; E. Somarè, Segantini, Bergamo, 1937; N. Barbantini, Giovanni Segantini, Venice, 1945; E. Diem, Giovanni Segantini, Kunst, XLVII, 1949, pp. 120–203; Kunstmuseum St. Gallen, Giovanni Segantini (exhibition cat.), Saint-Gallen, 1956]. *Armando Spadini*: b. Poggio a Caiano, 1883; d. Rome, 1925; painter (A. Soffici, Armando Spadini, Rome, 1925; A. Venturi and E. Cecchi, Armando Spadini, Milan, 1927; O. Vergani and L. Borghese, Spadini nella vita e nelle opere, Milan, 1946). *Pietro Tenerani*: b. Torano (Carrara), 1798; d. Rome, 1869; sculptor (O. Raggi, Della vita e delle opere di Pietro Tenerani del suo tempo e della sua scuola, Florence, 1880). *Gioacchino Toma*: b. Galatina, 1836; d. Naples, 1893; painter [M. Biancale, Gioacchino Toma, Rome, 1933; A. De Rinaldis, Gioacchino Toma, Milan, 1934; L. Salerno and E. Lavagnino, Mostra di Gioacchino Toma (exhibition cat.), Rome, 1954; R. Causa, Gioacchino Toma, BArte, XL, 1955, pp. 39–52]. *Giuseppe Valadier*: Rome, 1762–1839, architect (I. Ciampi, Vita di Giuseppe Valadier, Rome, 1870; G. Matthiae, Piazza del Popolo attraverso i documenti del primo Ottocento, Rome, 1946). *Vincenzo Vela*: Ligornetto, 1820–91, sculptor (M. Calderini, Vincenzo Vela scultore, Turin, 1920). *Federico Zandomeneghi*: Venice, 1841 – Paris, 1917, painter (E. Piceni, Federico Zandomeneghi, Milan, 1933; E. Piceni, Zandomeneghi, Milan, 1952).

ITALO-ROMAN FOLK ART. The arts of ancient Rome and of the Roman world during the periods of the late Republic and the Empire had no uniform characteristics or line of development. In some respects they were clearly influenced by Hellenistic forms and ideals (see HELLENISTIC ART; HELLENISTIC-ROMAN ART), notably in the taste for ornament and in the sphere of official art, although the latter presented new and specifically Roman requirements in architecture, in great commemorative reliefs, in portraiture, etc. (see ROMAN IMPERIAL ART). But there were also deeply rooted local traditions in the Italic and Etruscan world (including Rome itself in the early centuries of its history; see ETRUSCO-ITALIC ART) and in the Greek colonial world of southern Italy and Sicily (see GREEK ART, WESTERN), traditions that met and merged in the art culture produced by the unification of Italy under Rome during the late republican period. These traditions survived to some extent during the Empire, with certain unmistakable features, in minor works or in those produced privately or by the less important centers, even while the major trends of Imperial art were being established. Such works often have a decidedly folk character, as in a certain type of funerary relief, in house paintings and shop signs, and in random graffiti, which are of special interest because at times they are apparently reflected in sophisticated art and because of their relationship with provincial and Early Christian art (see CATACOMBS).

The production of folk art obviously must have arisen from local traditions, since Hellenism was an acquired culture and thus at first belonged to the intellectual world. Literature and the visual arts, though both notably influenced by Hellenism, took different paths of development. Literature of this period was produced by original personalities of high ability and vigor (for example, Plautus in the drama and Ennius in history), while art had no such masters until centuries later. There was no parallel in the visual arts for the folk humor and frankness of Plautus and his capacity for interpreting Hellenistic themes and turning them to his own purposes. In literature, the nature of the Latin language, unified in structure and vocabulary and closely related to the organization of Roman life, tended to standardize the means of expression. Art, having no such common idiom, developed later, expressing two different tendencies: one, an intellectual adoption of the wealth of Hellenistic forms, and the other a fluent narrative quality, a simple expressive immediacy — in other words, folk art. During the early period when the literary expression of the Roman spirit was taking form (ca. mid-3d cent. B.C.), there was no Roman art; instead, the imported Hellenistic art coexisted with the various local Italic currents, each with its own history and meaning. Roman civilization was to function as the catalyst, effecting the spread and assimilation of the Hellenistic influence.

For the sake of clarity the following discussion of Italo-Roman folk art is organized by areas. The subject does not lend itself to a judgment of esthetic values, but at the same time the undistinguished level of many of the products cannot always be attributed to artistic immaturity and lack of skill. The terms "impressionism" and "expressionism" are to be understood in the relative sense suggested by R. Bianchi Bandinelli and do not imply intention on the part of the artists.

One of the regions richest in Italo-Roman folk art is Campania, in the south, where the full development of local expression coincides approximately with the Romanization of the area, though there are iconographical similarities to Etruscan work. For example, the mother goddesses (IV, PL. 207) that were so frequent in Capua as to become stereotyped must be related to the similar and older figures from Chiusi (V, PL. 43), but the Capuan examples reveal no effort at formal discipline; the aim appears to be simple representation, which at times verges on expressionism. The Hellenistic contribution to local art appears in numerous pseudo-*naiskos* funerary steles with one or more full figures or busts (PL. 229). Comparison of the stele of Sabictius (which closely follows Hellenistic models in the placement of the figures) with that of Publilius (with its three crowded figures breaking through the border) indicates a transition from strict conformity toward the emergence of local characteristics, though the draperies of female figures continued to imitate Hellenistic forms.

The terra-cotta sculpture of Campania, which ranges from small religious images to statues of large dimensions and represents some rather ambitious subjects, shows greater freedom and a more clearly local manner. Cales (mod. Calvi Risorta), for example, produced *palliati* (cloaked figures) that repeat classic forms, but without understanding of organic structure; draperies are simplified to a few broad folds unrelated to the figure beneath, so that the clothed figure appears merely as a play of surfaces and serves as a support for the head. Some attempt to idealize the features is evident, and the locks of hair are rendered for effects of mass and color. The best of the Calene group is a bust that shows an original interpretation of a fine-arts theme. Similar treatment of borrowed themes may be seen in fragments of large terra-cotta steles, bearing images of veiled women or warriors or portraits of the deceased with the attributes of Hercules. Closer to Hellenistic models are the two great cult statues, *Jupiter* and *Juno*, from Pompeii, now in Naples (Mus. Naz.). The *Jupiter* shows a clearer understanding of figure construction. The *Juno* reflects the Eastern (Asiatic) Hellenistic motif of the female figure wearing a light tunic over a heavy robe, but the proportions are altered. In contrast to these, the *Victimarius* (sacrificing priest), also from Pompeii, is completely naturalistic, though in a manner quite different from the Hellenistic baroque influence seen in the *Victimarius* found in Rome, now in the Museo Nuovo dei Conservatori. The large Campanian terra cottas have various baroque characteristics (e.g., the attempt at effects and at expressiveness), but these are different from Hellenistic baroque, even though certain types are imitated (the *Jupiter* and *Juno* mentioned above, and the Pompeian statuette of a seated old man of the Hellenistic philosopher type). Frequently the small terra cottas show folk traits — for example, lack of interest in structural logic and coherence, purely superficial representation, and an occasional caricatural gesture such as may be found in later Pompeian bronzes (the naked old woman and the traveling vendor with his tray, examples that are quite consistent with the Hellenistic taste for the abnormal and the typification of physical deformity).

Pompeian painting gives further evidence of the objective realism of Campanian artists. The classic and Hellenistic designs widely adopted by the Campanian decorators seem to have had almost no influence on the manner of execution. The representations are sketchy, quick and spare in technique, and show little regard for problems of composition or color harmony. Immediacy of representation is the primary concern; caricature appears rarely and then usually in traditional iconography such as that of the well-known parody of the Judgment of Solomon (Naples, Mus. Naz.; VII, PL. 191) and in the grylloi, *The Flight of Aeneas*, in the same museum.

The subject matter of this local painting is broad, including religious images, genre scenes, narrative episodes, and portraits, sometimes in combination. The stately image of Venus, patron goddess of Pompeii, in an elephant-drawn quadriga (an Oriental motif) is painted on the wall of the fuller's shop of M. Vecilius Verecundus in Pompeii above a shop sign showing the work of the establishment (PL. 233; VI, PL. 61). A scene of similar character is that of the bakery (PL. 234), the work of a gifted craftsman who carefully depicted the details of the stall and the display of loaves. Not unlike the Venus in style are numerous lararium paintings, such as that from the House of the Centenary (Naples, Mus. Naz.), showing Bacchus enveloped in a bunch of grapes and a view of Vesuvius. Elimina-

tion of perspective is frequent in the lararium panels, and the ancient religious symbol of a serpent (agathodaemon) almost always appears coiling among the bushes. In these small domestic sacella the religious iconography and other elements of sophisticated art are set aside in the development of local characteristics. Representations of sacred ceremonies, particularly of the Oriental cults, often show the folk point of view. The procession painted in House IX, 7, 1 in Pompeii is an interesting example; the bearers have set down the litter with the statue of Cybele, which is surrounded by worshipers in one of those crowd scenes typical of folk art. Here, as in the Herculaneum mosaic of a school, lively portrait details single out individual gestures and personalities from the anonymous group. More fluent in execution, but also narrative in character, is the fresco, now in Naples (Mus. Naz.), of a procession of carpenters, showing a ceremony in the humble surroundings of an artisans' guild. The inn of House VI, 14, 36 of Pompeii has scenes with dice-throwers and other customers who "speak" through the inscriptions set beside them in a series of amusing episodes from everyday life.

Some influence of sophisticated origins does appear, however, as in the Pompeian genre mosaics attributed to Dioskourides of Samos (VII, PL. 166). From this type of subject only a short step is required for the representation of a historical incident of serious consequences, the wall painting of the brawl between Pompeians and Nucerines in the amphitheater of Pompeii (PL. 231). The pseudoperspective of the amphitheater and its surroundings (city walls, palaestra, trees, sheds, and vendor booths) gives a compositional unity to the small scattered groups of miniature figures.

In contrast to this scene, with its attempt at bird's-eye perspective and its episodic and sequential arrangement, are realistic representations with a more unified construction certainly modified by sophisticated art. In such paintings as realistic banquet scenes (as in a house in Pompeii V, 2), with careful iconographical details and keen observation of humorous episodes, and the fresco of the student whipped in the presence of his classmates, the emphasis is on simple representation of an event, and there is no attempt at depth or perspective. A neutral background eliminates spatial values, and prolepsis often serves in place of perspective (S. Ferri). Furthermore, the inorganic construction of the figures indicates that they were painted without a cartoon and that the painter was left to his own improvisational devices. What is most interesting in these genre scenes, in addition to the immediacy of the events depicted, is the individuality of the characters, realistically distinguished as portrait sketches.

True portraits appear in the Pompeian fresco long thought to be of a baker and his wife (VII, PL. 204), with its insistence on individual physical details such as the sparse beard and moustache of the man and the artificially curled locks of the woman. The dignity implied by the inclusion of a scroll and a tablet and writing stylus does not disguise the fact that the couple portrayed are probably persons of modest status.

Along with this strain of analytical realism in Campanian painting, another manner was adapted to folk themes, making use of a rather impressionistic spot technique (*macchia*). This technique may be seen in the well-known painting *The Worship of Isis* from Herculaneum and in paintings from the Villa of Julia Felix in Pompeii, including a group of horses and riders, a vignette of a pack mule, and a view of an open-air market before a colonnade (all, Naples, Mus. Naz.). These reveal an awareness of style and a search for expressive means beyond simple representation of incidents and episodes; paintings of sacred landscapes and imaginary views of villas and gates combine Hellenistic influences with later developments of much greater range. Nevertheless, the local current of analytical realism also enters into copies of famous paintings, giving them a folk quality. Examples are found in a Pompeian rendering of Achilles at Skyros and in a Pompeian fresco version of Theseus, slayer of the Minotaur, showing the hero surrounded by youths (both, Naples, Mus. Naz.). A painting from Isernia (anc. Aesernia), also now in Naples, popularizes the funerary theme of Hermes Psychopompos with the idiom of folk painting.

The political-economic unification of Italy under Roman domination contributed greatly to a mutual assimilation among the various culture components of the Italic world. This process operated in two ways: the founding of Roman colonies (4th–2d cent. B.C.) gradually enlarged the area of Roman-Latin population, while Italic elements flowed into Rome in great numbers. The Romanization of central and southern Italy in this manner is demonstrated in some of the sculpture. A series of busts, chiefly intended as portraits, from the Tarentine area indicates Roman colonization. Their structure and character are foreign to the tradition of Magna Graecia and comparable, rather, to works from the central-southern area of the Tyrrhenian shores, from Tarquinia to Palestrina to Campania. [In this connection, Herbig (1942) has pointed out the magical value attributed to the head, which is conjectured to have given rise to portraiture.] The imagines common to Etruria, Latium, and Campania (which continued in Campania even amidst an environment of sophisticated art, as in the lararium of the House of Menander in Pompeii) are often unrealistic in proportions and, instead of belonging to figures, are directly attached to geometric supports; those in Taranto resemble the upper part of a herm. The attempt to represent individual traits, to define a personality by an exact reproduction of the facial features, partly parallels and partly follows the production of these family cult images (perhaps with the intervening step of the funerary mask). However, little effort at portraiture is shown in certain clay heads from Latium, and others from Bologna and Piedmont, which represent the deceased person with a crown (PL. 230). These heads are related to other examples from southern Etruria and have in common a tendency toward expressionism that, in spite of the diversity of the versions, identifies a particular method adopted in Etruria and Campania to represent form. The Etruscan examples reveal a greater artistic awareness and capacity for authentic details, while the Campanian works are casual and vacuous. The geographical range of these heads is demonstrated by the fact that a bust from Ancona, although not particularly early (after 50 B.C.), shares the same traits as those from Etruria and, even more clearly, those from Campania.

The Romanization of northern Italy followed the pattern of the central-southern unification. Colonists for the Po Valley were drawn in great numbers from the central and southern districts, though other peoples settled there independently of the Roman governmental program. These movements took place just before and during the period of political unrest in the east, when Italy was opened to Asian and Greek Hellenistic influence, both directly and, as in earlier times, by way of the cities of Magna Graecia.

The effect of these events in the sphere of art was not only to flood Rome, and eventually other centers, with classic and Hellenistic original works, copies, and academic reinterpretations, and to attract great numbers of artists and craftsmen to the city, but also to extend the Greek influence into even the most modest local workshops. Rome itself had had no previous artistic distinction and in ancient times had relied on the Etruscans for the more important artistic undertakings, a responsibility later entrusted to Italiotes, Greeks, or Hellenized natives. Republican Rome appears to have been indifferent to art, an attitude which, even with the full assimilation of Hellenism, was expressed from time to time in conservative writing. Two art forms excepted from this indifference were the imagines of the domestic cult and triumphal paintings. The latter were viewed as informational pictorial reports of battles and other important topics and may have contained landscape or cartographic elements along with the figures. Among the few remains of such paintings are the fragments of a fresco from the Esquiline hill, with the meeting of Quintus Fabius and Marcus Fannius (VII, PL. 260). While its immediacy of representation and lack of stylistic pretense suggest folk art, it cannot easily be so classified, since practically none is known to have been produced in Rome. However, this statement must be balanced against the fact that little archaeological material remains from the early and middle republican period in Rome and its immediate surroundings. Later, in the first century B.C., when

UP State Museum, Lucknow

figural art increased and aroused the interest of a broad public, the focus was almost exclusively on funerary portraiture.

Portraits on the tomb slabs of the Roman cemeteries are strongly realistic, though some clearly show a stylistic adaptation to one or another of the Hellenistic influences which tended to soften the objectivity of the literal portrait. Further dependence of funerary portraiture on sophisticated forms is often shown in the borrowing of Hellenistic iconographical schema or drapery rhythms, particularly in female figures. The formation of the Roman portrait head was perhaps influenced more by Campanian "realism" than by the contemporary art of Etruria, which was more prone to interpretation than to simple analytical rendering of facial features. By comparison, Campanian art is closer to folk art in feeling, in that it tended to create the type-sketch and shows little effort at delineation of individual personality even by detailed observation of the features. Actually, the physiognomical portrait, with its serious approach, expresses a concept of personality that is characteristic of the Roman mentality; it cannot, thus, be explained simply as an adoption of folk-art elements into sophisticated art. However, in contemporary literature the transformation of nonliterate folk forms (the *atellana*, the *fescennino*, the *satura*) into sophisticated forms can be clearly demonstrated. The original dialects were replaced by the Latin language, so that the transformation obviously took place in the sphere of Roman culture. These folk literary forms came from about the same areas as the art forms discussed above, but there is not sufficient contemporary evidence to prove that the figural arts underwent a similar development, even though the literary parallel might suggest this.

During the middle and especially the late Republic, the central Italian cultural area produced a great deal of figural art, well defined as to subject matter, with reliefs of ceremonial and public spectacles, such as the *ludi gladiatorii*, predominating. The descriptive character of these reliefs can be related both to Samnite painting and to Etruscan reliefs with processions of magistrates. Outstanding examples of this local art are two reliefs from Preturo, now in the museum of Aquila, one a gladiatorial combat and the other a funeral scene (PL. 229). In the latter the scattering of the procession in superimposed registers and the pseudoperspective view indicate that the artist could have had no more than a superficial knowledge of sophisticated sculpture and painting.

The gladiatorial reliefs, too, are often characterized by pseudoperspective and prolepsis. The theme occurs in Pompeii (tomb of M. Umbricius Scaurus, with stucco reliefs), but representations of the kind are particularly frequent in middle and southern Apennine Italy, where the dimensions of the reliefs are occasionally very large. While the gladiatorial spectacle may have been originally an Etruscan custom (Athenaeus, *The Deipnosophists*, iv, 153 f) and is first represented in Etruscan art, the subject was widely popular. This is amply documented by the relief from Preturo and by those from the tomb of C. Lusius Sorax in Chieti (anc. Teate), now in the local archaeological museum. The figures, though occasionally revealing classical or Hellenistic influences, are generally marked by a direct observation of nature and are executed according to a few rather uniform schemes. They would seem to be the antecedents of the many clay and bronze statuettes of gladiators, of decidedly folk-art character, that were widespread throughout Roman Italy and beyond, and of the gladiator reliefs on lamps, terra sigillata, and other objects, all more or less homologous over a long period. The aspects of particular interest in the gladiator type are the pose and the equipment denoting his specialities. In time, however, the minute descriptiveness evolved into a representation so summary as to be sketchy and expressionistic. The gladiatorial reliefs belong to a particular period in the artistic development of central and southern Italy and are rarely found north of the Apennines. An exception is a rather well-known slab of the republican period from the eastern necropolis of Bologna.

In the funerary sculpture of central Italy the same episodic and descriptive character appears, but portraiture occasionally followed the Roman physiognomical type, though with varying degrees of proficiency. These tendencies are evident with particular immediacy on a stele from Isernia depicting a conversation between a traveler and his host; the dialogue is indicated in the inscription and gives color and comic cadence to the scene. This relief presents an interesting parallel to the Campanian paintings of tavern scenes, and the presence of such a subject and the use of dialogue on a funerary stele are particularly indicative of the narrative trend.

In the region north of the Po, as well as in Venetia, the representation of realistic themes and sketches from daily life appears chiefly on clay lamps, a folk product for folk use, though the figural repertory was for the most part abandoned in local imitations of Arretine ware. The lamp decorations vary greatly in subject matter, including many hunting and arena scenes, and are at times crudely pornographic. Themes of genre type are also documented in the north by small carvings in amber, comparable to similar earlier products of southern Italy. Examples of such carvings have been found northwest of the Po, notably at Aquileia; the anecdotal character of these pieces often takes a grotesque form. Aside from these objects, however, the arts of the north present the problem of the relationship between folk art (q.v.) and provincialism (see PROVINCIAL STYLES), and since in many respects the north of Italy was culturally a province, subject to a considerable time lag in its development, the question of the origin of peripheral art styles is also involved. The survival of the local pre-Roman civilizations in this region was limited in its effect on art, providing subject matter rather than determining form. A few elements from the Celtic past were retained, such as the bodiless heads, *têtes coupées* (III, PL. 111), placed in classicizing decorative contexts, and representations of the devouring funerary monster, a fairly common element of funerary iconography in the Po Valley. Of the Venetic past, whose direct connection with early Roman elements is documented in Este, no traces remain in the developments of local Roman art. On the whole the artistic crafts of the north, particularly the funerary sculpture, had their origin in the mainstream of sophisticated arts; both in the portrait type and in the use of classicizing or Hellenizing motifs and rhythms, they constitute a popularization of fine-arts forms, rather than a continuation of folk strains. Venetia, in particular, was open to Hellenizing influences and diffused them to the interior of the Po Valley.

In the funerary portraiture of the north a detailed realism was generally favored, even after this was no longer fashionable elsewhere, but the idealized portraits of the Augustan, Julio-Claudian, and Flavian periods also frequently served as models. As a result, realistic representation of the features often gave way to indefinite, rather than idealized, traits, and the identification and characterization of the individual personality were left to the inscription.

In Venetia a severe, dry linear style became general, and only rarely did there appear such scenes of daily life and activities as the relief of the situla maker in Este (anc. Ateste) and the more cursive one of the fruit vendor in Verona. In Verona, Brescello (anc. Brixellum), and the lower Po region figures shown wearing the *lorica* or the *lacerna* occasionally show iconographic influences from beyond the Alps. In Emilia and Lombardy there was no such homogeneous style as that of Venetia, but the characteristics of portraiture were approximately the same. Genre scenes such as that on the stele of the *faber navalis* (shipwright) Longidienus in Ravenna (PL. 229) and that of the goldbeater and the swineherd in Bologna (Mus. Civico) are isolated examples. In Piedmont (western Po Valley and inner Liguria), however, genre scenes are common; recurrent themes include the flocks and herds of domestic animals and the wine carts so characteristic of the area. Also, in Piedmont strongly local tendencies are revealed in the accentuated provincialism of works such as the silver bust of Lucius Verus from Bosco Marengo (Turin, Mus. di Antichità), the *Jupiter* of Aosta (Mus. Archeologico), and small bronzes such as the *cucullatus* of Aosta (PL. 230), which is more caricatural than realistic. A unique work of this local craftsmanship is a large statue of a female divinity, probably Minerva, in Bergamo (Mus. Archeologico). It is an eclectic patchwork of disparate

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

elements, not assimilated to one cultural tradition but superficially recorded in a summary way, and not comparable to any recognized type. Northern Etruria, in comparison with the rather well-defined artistic facies of central and southern Italy, shows a dissipation of its earlier tradition and a waning of expressive capacity. The precepts of the 2d–1st centuries B.C. were no longer effective, and the funerary production of the Etruscan area became fairly uniform and lacking in character.

Except for the few areas and products mentioned above, northern craftsmanship does not in general display the lively inventiveness nor the detailed anecdotal observation found in the south and is impoverished in such forms of expression as the small clay sculptures. The figural types of the north are, for the most part, related to transalpine provincialism, that is, to a fusion of elements derived from the more sophisticated arts and adapted to local styles. On the whole, the folk-art trends of Italic origin tended to die out during the Imperial age, giving way to popularized versions of fine-arts themes, with a decline of interest in everyday life and an orientation toward elaborate acquired forms illustrating mythology and history.

The relationship between the art of the north and that of the southern and central regions, as well as the existence of a considerable, though indirect, Hellenistic influence, is apparent in all these movements. The connections are evident in the most widespread forms of the funerary marker: the cusped cippus and the architectural stele, which are comparable in development to the Campanian steles. In the steles of the Po Valley, for example, the Hellenistic pseudoarchitectural tradition merged with the Roman one of multifigured slabs, giving rise to the typical monument of the area, the great stele with a series of busts. The surviving Celtic elements are more difficult to identify, but the devouring monsters mentioned above and the decorative and iconlike heads in the garland altars of Venetia may be recognized as relics of Celtic iconography.

Much of the funerary art, because of the preponderance of small markers over great monuments, remained on the folk level, distinct from the eclectic and academic imitations of the fine arts. At times folk art also encompassed both religious themes from the sophisticated tradition (as in the previously cited goddess of Bergamo and the *Jupiter* of Aosta) and Imperial iconography (bust from Bosco Marengo) in a phase coexisting with the "provincial" component in Imperial art from Trajan's Column on. Moreover, although its characteristics have not yet been clearly defined, a local artistic activity also existed in seemingly out-of-the way areas, such as the territory of the Segusii (Susa), where, in 12 B.C., an official monument was carved by local stonecutters who did not limit themselves to copying the models sent from Rome (PL. 230). The isocephalism of the sacrificial animals in a part of the Susa frieze suggests an artistic tradition rather than a chance arrangement. Unfortunately, the antecedents, the connecting links, that would explain the origin of such figural forms are lacking. Even so, in spite of their apparent awkwardness, these forms cannot be ascribed solely to lack of skill; in a stele marked "Rinnius" in Turin, for example, with the theme of the wine cart, the design is clearly intentional.

Of the arts of northern Italy, those of Venetia, Lombardy, and Emilia certainly stand out as the most sophisticated, the most refined and elaborated, while those of the western Po Valley present many similarities to the figural forms of the neighboring transalpine provincial areas. A comparison of the products of these two broad cultural regions reveals that provincial art and folk art are not identical — or at least that they may produce differing forms and results. For example, the severe linearism of Roman steles in Venetia is quite unlike the pleasing decorative line of the northern examples of "Orientalizing" style. Similarly, though the Celtic background emerges more in the subject matter than in the form, direct borrowing, if not actual importation, occurs in Liguria; for example, the so-called "Tarasca" (Fr., Tarasque), or "Cerberus," in Genoa (Mus. Civico di Archeologia Ligure). All northern Italian funerary art, as well as that of central Italy and of Rome itself, has a folk-art quality consistent with the social classes for whom the extant monuments were produced.

Italo-Roman folk art, especially funerary art, was at its apex during the 1st century B.C. and the 1st century of the Christian Era. Thereafter no substantial innovations occurred, and craftsmanship stagnated. It was in painting and mosaics that the earlier elements continued in effect throughout the Imperial period. The pavement mosaics of the Piazzale delle Corporazioni in Ostia Antica (PL. 232), with scenes relating to the various agencies that surrounded the square, offer a range of such elements. The scenes are sketchy and lack the effective immediacy and the clear narrative quality of the genre scenes of 1st-century Campania. They are emblematic fixed elements that serve to identify the individual offices rather than to advertise their activities. Ostia also has preserved a quantity of small works illustrating daily life and activity. Together with Pompeii, Ostia offers the broadest coverage of examples of this kind: a greengrocer counting on his fingers behind the counter, with a lavish display of wares made clearly visible by the pseudoperspective; shoemakers at work; a poultry seller; and a midwife depicted with crude realism — these are among the most cogent documents of this functional folk art. Also included in this category are the paintings in the House of the Painted Vaults, an advertising display of food in the Thermopolium (a bar where hot drinks were served), and reliefs of a butcher, a milkman, and a knife grinder. All these folk works at Ostia, however, lack the vivacity of their Campanian antecedents. Instead of being characterized as individuals, the figures tend to be typed, the action being of more interest than the subject. The style in such reliefs as those of the poultry seller, the butcher, and the tavern on the port, is very close to that of the sarcophagi of the late 2d century and the 3d, works, that is, which are not on the craft level but belong to the fine arts.

The question thus arises whether these works are to be considered an adoption of the expressive forms of fine art by folk artists, or the acquisition and interpretation of folk motifs by the fine arts. G. Rodenwaldt (1935) was one of the first to maintain that the folk component had a significant influence on the stylistic revolution that began in the Antonine period (see ROMAN IMPERIAL ART), though this influence cannot have been due exclusively to elements from the Italic cultures. A more accurate explanation may be the existence of a wide circulation of folk elements, quite complex and still insufficiently analyzed. The developments of Style III that were carried over into wall ornamentation of the 2d and 3d centuries can be described only as folk art. Isolated figures, which are allusive rather than descriptive, are sketched in the oblong areas formed by the threadlike partitions of the uniformly white field of the wall. The motifs are even more cursive in the late-2d-century House of Diana in Ostia, in a contemporary house on the Palatine, in sacella, in shops such as the tavern at the foot of the Capitoline hill (A.D. 240), in tombs, columbaria, and Christian and Jewish catacombs. This decorative art can be considered folk art more because of its diffusion than for its inspiration, since it is almost always indirectly derived from sophisticated art and is more symbolic in spirit than narrative or episodic. In this way folk forms entered into the formation of the art of the late-antique period (q.v.).

In brief, the discussion of Italo-Roman folk art may be summarized as follows: the folk trends of Roman Italy do not form a unified whole, but vary greatly according to their local antecedents (Campania), to the degree of importation of outside elements (central and eastern Po Valley), or to the assimilation of elements traceable only theoretically by parallels with transalpine art (western Po Valley). The provincial character of northern art is thus clearly different from that of central and southern Italy, where elements of continuity can be distinguished.

In all these areas the art of the folk is essentially representational, with caricatural overtones in the south, functional and utilitarian elsewhere. The caricatural vein is far removed from the humor of the ancient *phlyax* vases and the Tarentine figures. At times, as in the wall paintings of great men in the Baths of the Seven Sages at Ostia (G. Calza, *Die Antike*, XV, 1939, p. 99), the satire exists not in the representation but in a literary context, in this case the juxtaposition of inscriptions prescribing for the bodily functions. In general, the effort at realistic inter-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

pretation precluded the distortion inherent in caricature, and in any case, the Roman spirit was closer to the crudity of sarcasm than to the finesse of irony.

There is no particular medium peculiar to Italo-Roman folk art; rather, folk themes occur in all the fine arts and crafts media. The folk character of the works relates more to their purpose than to their source of inspiration. Practically speaking, religious *imagerie* is always derived from the fine arts.

These developments should be judged with caution; their influence on the art forms of the provinces cannot yet be precisely defined, and the possibility of concurrent art movements should not be ignored.

ITALY. The territory of Italy constitutes a well-defined geographic and ethnic unit. Bounded on the north by the Alps, the Italian peninsula and islands extend into the Mediterranean toward the African coast. Because of its position, the territory has served as a bridge to continental Europe and has been a constant participant in world history. Under the Roman Empire Italy was the center of Western civilization for several centuries. With Rome as the seat of the papacy and the center of Western Christianity, the learning of classical civilization was collected and preserved in Italy during the Middle Ages. And, as the cradle of the Renaissance, Italy exercised a preeminent influence on the intellectual and artistic development of modern Europe. While Italy's open coastline has fostered the assimilation of external influences, often decisive for the cultural experiences of the Italian area, its mountainous terrain has favored the development and survival of distinct regional customs. This diversity, however, did not prevent the advancement of cultural unity. Even in antiquity there was a sense of unity, which increasingly asserted itself in culture and language through the Middle Ages and into modern times. This development culminated in the 19th century with the attainment of Italian political independence and unity. (The Kingdom of Italy was established in 1861; Italy became a republic in 1946.) The art of Italy parallels its history in that it has frequently been of universal importance (as in the diffusion and repeated revivals of classicism) and sought after and revered by other cultures. From the end of the Middle Ages, Italian art (q.v.) has gradually acquired common characteristics that transcend local schools and make it a well-defined and significant entity within the larger confines of European art.

SUMMARY. Historic and artistic periods (col. 484): *Antiquity: a. Prehistory and protohistory; b. Pre-Roman Italy; c. Roman Italy. The Middle Ages: a. Early Middle Ages; b. Romanesque period; c. Gothic period. Modern period; a. The Renaissance; b. Baroque; c. Neoclassicism; d. 19th and 20th centuries.* Art centers. *Historical geography of Italy* (col. 511). *Rome, including Vatican City* (col. 512). *Piedmont and the Aosta Valley* (col. 531). *Lombardy* (col. 541). *Trentino-Alto Adige* (col. 561). *Veneto* (col. 565). *Friuli-Venezia Giulia* (col. 587). *Liguria* (col. 592). *Emilia and Romagna, including the Republic of San Marino* (col. 598). *Tuscany* (col. 615). *Umbria* (col. 646). *Marches* (col. 660). *Latium* (col. 669). *Abruzzi and Molise* (col. 686). *Campania* (col. 693). *Apulia* (col. 712). *Lucania* (col. 721). *Calabria* (col. 725). *Sardinia* (col. 731). *Sicily* (col. 736).

HISTORIC AND ARTISTIC PERIODS. *Antiquity. a. Prehistory and protohistory.* Remains of Upper Paleolithic art are less profuse in Italy than in western Europe (see FRANCE; SPAIN), but numerous rock engravings have been discovered in Apulia (Grotta Romanelli), Calabria (in a cave near Papasidero), the Egadi (Aegadian) Islands (Levanzo), and Sicily (on Mount Pellegrino, particularly in the Addaura cave). The Addaura cave contains not only representations of animals but also lively compositions with human figures. Some of these carvings may date from the early Mesolithic period, but remains of genuinely schematic mesolithic carvings are rare (e.g., at Sezze Romano). The earliest sculptures are the naturalistic "steatopygous Venuses"; particularly important ones were found at the Balzi Rossi in Liguria, Savignano on the Panaro River, and Chiozza di Scandiano near Reggio Emilia. The last two are certainly post-paleolithic and perhaps from a relatively late period. (See XI, PLS. 244, 257, 283–285, 287, 293, 294.)

The succession of cultures in Italy from the Neolithic through the Iron Age has been reconstructed (though with not a few gaps and uncertainties), chiefly on the basis of stratigraphic excavations carried out by L. Bernabò Brea in the Arene Candide cave (Liguria) and in the Lipari Islands (see MEDITERRANEAN PROTOHISTORY). The beginning of the Neolithic period dates at least from the 5th millennium B.C. Broadly speaking, the following periods in Italian prehistory may be distinguished: (*a*) Early Neolithic — diffusion of stamped pottery. (*b*) Middle Neolithic — painted and incised pottery in southern and central Italy. Danubian influences (e.g., square-mouthed vases) in the north. (*c*) Late Neolithic — monochrome polished pottery (Diana and Lagozza styles). (*d*) Early metal ages, including the Aëneolithic period (corresponding to the chalcolithic), and the early Bronze Age (from the late 3d to the first half of the 2d millennium B.C.) with varying agricultural societies — Early and Middle Helladic influences in southern Italy; diffusion of bell beakers from western Europe. In Sicily the important cultures included those of Serraferlicchio, San Cono – Piano Notaro, Conca d'Oro, and Castelluccio; in Sardinia, Anghelu Ruju; and in continental Italy, Cellino San Marco, Gaudo, Rinaldone, Remedello, and the so-called "proto-Apennine cultures." (*e*) The height of the Bronze Age (15th–13th centuries B.C.) — influences from Late Mycenaean civilization (see CRETAN-MYCENAEAN ART), in Sicily (Thapsos), the Lipari Islands (Milazzese promontory), and in Apulia (Scoglio del Tonno), and the Apennine cultures. (*f*) Late Bronze Age and the transition to the Iron Age — a well-defined sequence of cultures in Sicily (Pantalica Nord with Mycenaean reminiscences, Cassibile-Dessueri, and Pantalica Sud; otherwise defined as Pantalica I, II, and III); the Lipari Islands (Ausonian I and II). The peninsula saw a vast diffusion of the sub-Apennine culture, the appearance of cremation tombs of the proto-Villanovan type, and, in the Po plain, terramara settlements.

Ceramics (q.v.) constitutes the most significant aspect of early art production; in its diverse techniques it attained a high degree of excellence, particularly in the Neolithic period. The Serra d'Alto pottery, diffused throughout southern Italy, is especially noteworthy for its fine clay, elegant geometric designs (particularly the spiral meanders), and variety of plastic ornamentation on the handles and spouts (IX, PL. 429). Sculpture is limited to modest examples of terra-cotta or stone statuettes, less interesting stylistically than the pottery. The Sardinian limestone idols, however, are an exception; these schematic female statuettes recall the idols of the Aegean Sea (Cyclades, Crete). Similar figures, painted, have been found in a cave in Levanzo in the Egadi Islands.

As early as the Neolithic period hut villages protected by trenches or walls appeared; the huts were round, ovoid, or rectangular, and sometimes had dry stonework foundations. Palafitte dwellings were typical of northern Italy and particularly of the Alpine lakes; they developed most extensively during the Bronze Age. Toward the end of the Bronze Age, villages on pilings protected by embankments (the already mentioned terramare) flourished in the Italian plain. Architecture assumed a durable and monumental aspect only in the south and in the islands. Sardinia, like Corsica (see FRANCE), participated in the diffusion of western European megalithic architecture (see EUROPEAN PROTOHISTORY), as evidenced by its dolmens and menhirs. The megalithic corridor tomb developed in the late 2d millennium into the characteristic "giant's tomb" with exedra façade and central stele. Apulia boasts a few isolated dolmens and menhirs, which date no earlier than from the Bronze Age. On the other hand, the nuraghi of Sardinia are linked not to western Europe but to the Mediterranean tradition — Cyprus (q.v.), the Aegean (see GREECE), Malta (q.v.), and the Balearic Islands (see SPAIN, and more generally, MEDITERRANEAN, ANCIENT WESTERN; MEDITERRANEAN PROTOHISTORY).

UP State Museum, Lucknow

These complexes consist of truncated-cone towers and rings of large, hewn or irregular blocks of stone, and false vaults or domes. Thousands of these monumental nuraghi still survive, testifying to a highly advanced Bronze Age civilization (second half of 2d–early 1st millennium B.C.) on the island (XI, PLS. 401, 402). Similar round structures, of much coarser workmanship, are extant in Apulia and the island of Pantelleria.

As far as we know, the figural arts from the Bronze Age until the beginning of the Iron Age were modest and without a continuing tradition, and there was a remarkable diversity in style from one region to another. In the Alpine zone, schematic rock carvings of real subjects and symbolic images have been found near cult places that continued to be frequented even during the historic period, as in the Valcamonica and the Valley of Marvels at Monte Bego near Tenda (Tende, France). Steles carved in the shape of human figures, the so-called "stele-menhirs" survive in Lunigiana, Alto Adige, Apulia, and Sardinia (as well as Corsica). The production of small terracotta figurines, sometimes added to vases as ornaments, continued sporadically. Small cast bronze figures used as vase ornaments or votive figures began to appear; about the beginning of the 1st millennium B.C., the nuraghic culture of Sardinia particularly excelled in this art. The art of hammered cast bronze, directly connected to central European and Danubian production centers, had its most significant development in continental Italy, particularly in the Iron Age. Until the Iron Age the decoration of ceramics, bone objects, metal ornaments, and utensils remained faithful to geometric systems. (These objects are of small esthetic interest; painted pottery with geometric ornament largely disappeared in the Bronze Age.) There were stylistic differences according to period and place. The Apennine settlements, especially Ariano Irpino, Filottrano in the Marches, and Belverde on Mount Cetona, produced impasto vases, sometimes engraved or inlaid, decorated with painted meanders, spirals, and checkerboard patterns.

b. Pre-Roman Italy. The Iron Age cultures (from the 9th century B.C.) exhibited close connections with the preceding prehistoric cultures. The social structure remained based on village groups. Since production depended on the needs of the family and the small community, it was limited to household goods and objects of personal use. But certain innovations did appear at this time: the establishment of cremation rites using cinerary urns (especially in north-central Italy), progress in bronze working, and the use of iron in weapons and tools. A geometric decorative system of rectilinear motifs was adopted; it was parallel to and partly inspired by contemporaneous Greek Geometric (see GEOMETRIC STYLE). The Greek colonization of Italy, which began in the 8th century, soon exerted a determining influence on the development of Italian Iron Age civilization, enriching it with Eastern and Greek elements (see ORIENTALIZING STYLE). By the 7th–6th century, a large part of the Italian peninsula, especially the south and the Tyrrhenian area, had entered the sphere of a superior urban civilization of archaic Greek inspiration.

The Iron Age is particularly characterized by the formation of well-defined regional areas, which by their geographical distribution correspond in large part to the ethnic groups of ancient Italy as recorded in literary sources. These groups have also been documented by the discovery of epigraphs in the various languages and dialects. In Sicily the Siculi held the east-central part of the island (Finocchito culture) and the Sicani the western part. The area of southern Italy from Calabria to Campania, characterized by heavy Greek infiltration, was inhabited by the Itali, Siculi, Morgetes, Oenotrii, and Ausones, all of whom buried their dead in pit graves. The Daunian, Peucetian, and Messapian peoples occupied Apulia and made up the Apulo-Salentine cultures; they produced typical Geometric-style pottery and practiced inhumation in pit and box graves. The cultures of the south-central Adriatic side of the peninsula, corresponding in large part to the area of the Umbro-Sabellian dialect, used burial rites; particularly interesting finds have been made in the Marches (notably in the Picenum area). Cremation rites were practiced by the early Latins, who occupied Latium. The Villanovan culture was centered in Etruria, with other sites in Romagna and Picenum (Fermo) and a similar group in southern Italy in the Salerno region (Pontecagnano near Salerno and Sala Consilina inland); this culture too practiced cremation, and is known for its typical biconical ossuary. The Atestine culture (from Ateste, now Este), which flourished in the Veneto and practiced cremation rites, is certainly to be identified with the Veneti of Roman tradition. The Golaseccan culture, situated in the upper and middle Po plain, the Alpine lake district, and Liguria, practiced both cremation and inhumation rites and is to be attributed in large part to the Liguri.

The primitive structure of some of these cultural groups remained unaltered by the passage of time and the diffusion of Greek and Etruscan influences. For example, the Apulo-Salentine peoples, while adopting the Greek city type and certain forms of Greek artistic production, remained faithful to their custom of burying the dead in caskets in their towns (as at Gioia del Colle) and to the tradition of geometric pottery decoration until the end of the Hellenistic age. Likewise, forms of Iron Age culture long survived in central Italy and among the Veneti and Ligurians of northern Italy. The arrival of Celts in northern and central Italy during the 5th and 4th centuries B.C. brought no substantial cultural changes, although traces of Celtic art and culture are to be noted here and there in the Po plain and especially in Picenum (see CELTIC ART). The primitive Villanovan and Latian cultures were, however, early transformed into the urban civilization of Etruria and Latium. (For detailed ethnographic and historical description of pre-Roman Italy see ETRUSCO-ITALIC ART and V, FIG. 103.) From the artistic point of view, the zone occupied by Greek colonies — Sicily and that part of southern Italy known as "Magna Graecia" — was most important. The principal art centers in Sicily, from north to south, were Himera, Zankle (mod. Messina), Naxos, Katana (mod. Catania), Leontinoi (mod. Lentini), Megara Hyblaia, Syracuse, Camarina, Gela, Akragas (mod. Agrigento), and Selinous (mod. Selinunte); in Magna Graecia, from east to west, Taras (mod. Taranto), Metapontion (mod. Metaponto), Siris, Sybaris, Kroton (mod. Crotone), Caulonia, Lokroi hoi Epizephyrioi (mod. Locri), Rhegion (mod. Reggio Calabria), Medma, Hipponion, Pyxous (mod. Policastro), Velia (or Elea), Poseidonia (Paestum), Naples, Pithekoussai (mod. Ischia), and Cumae. From the 8th to the 3d century B.C. these Greek centers produced work in no way inferior to that of the motherland in philosophy, literature, science, art, architecture, and social and economic organization. Local geographic conditions, however, gave this work certain distinctively Italian aspects (see GREEK ART, WESTERN). Imposing remains of temples, especially Doric, survive, some almost totally intact (e.g., at Paestum, Agrigento, and Selinunte); also extant are ruins of theaters (e.g., Syracuse), sepulchral monuments, and other buildings. From the late 6th century on, the plan of many cities consisted of a regular design based on the perpendicular crossing of main avenues (πλατεῖαι) and smaller streets (στενωποί) rhythmically interspaced, creating elongated rectangular blocks of uniform size (with, as a rule, a short side of one *actus*, about 115 ft., in length). This grid type of city plan, which the ancients attributed to Hippodamos (q.v.) of Miletos, is best documented in Italy. There are notable remains of city fortifications in Syracuse and Selinunte. Architectural sculpture was also important (temple metopes from the Heraion at the mouth of the Sele and Selinunte, among others, are extant), and painted and occasionally modeled terra cottas were developed for decorative ends. Terra-cotta votive figures were produced throughout the area. In addition to imported ceramics (Geometric, Corinthian, Laconian, East Greek, Attic, etc.) there were local styles, which, from the 5th century on, increased in importance and originality in the wake of widespread imitation of Attic pottery (proto-Italiote, Apulian, Lucanian, Campanian, and Siceliote). The art of coinage, especially at Syracuse, reached a high level.

Some few remains testify to the architectural and artistic activity of the Phoenician and Carthaginian colonies. In western Sicily fortifications have been discovered at Mozia (anc. Motye) and tombs at Capo Boeo (anc. Lilybaion); in Sardinia ruins of sacred buildings and tombs survive in Cagliari, Sulci, and Tharros. Valuable examples of Orientalizing goldsmith work, masks, and multicolored glass-paste jewelry have been found in the necropolis of Tharros (see PHOENICIAN-PUNIC ART).

Apart from Greek Italy, the civilization that first demonstrated a clear political and cultural structure and unity was that of the Etruscans. It evolved after the middle of the 8th century from the Iron Age Villanovan culture, within the area bounded by the Tiber and Arno rivers and the Tyrrhenian Sea. Cinerary urns were replaced by chamber tombs, and new art forms of Orientalizing inspiration were introduced. This culture comprised autonomous urban centers, chiefly coastal, that were linked by language and religion. During the 6th century the Etruscans expanded southward into Latium and Campania (where they founded Capua) and northward into Emilia (founding Marzabotto, Felsina, etc.). This expansion was arrested by the Greeks at the battles of Ariccia (end of 6th cent.) and of Cumae (474 B.C.). In the 4th century grave losses were inflicted by the Gauls to the north and east, and in the following century even more decisive losses were sustained at the hands of the Romans. But the complete assimilation of the Etruscan culture by the Roman did not take place until the 1st century B.C., with the municipia and veterans' colonies established by Sulla and later by the Triumvirates.

Etruscan cities were usually built on hilltops with fortifying walls of ashlar (as at Caere, mod. Cerveteri; and Veii, mod. Veio) or polygonal masonry (Rusellae, mod. Roselle; and Cortona), according to the area. The arch was developed as a monumental form from the 4th century on. Very little is known of Etruscan city planning: a regular division has been suggested, on the basis of analogy with the division of the sky by orthogonals (for divinatory purposes), but

this thesis is not confirmed by study of the few remains (e.g., at Vetulonia and Veio); the plans of Marzabotto and Capua must reflect Greek plans, since even the measurements correspond closely. The temple is typical of the architecture of the period because of its traditionalism; it long preserved the wooden structure and clay decoration, the ritual orientation of the structure (generally to the south), the tripartite plan of three equal cellae or a large central cella with two smaller flanking ones (this was, however, more rigid in Vitruvius' theory than in reality), and the architectural concentration on the frontal view.

Less is known about the Etruscan house. The ancients' belief that the atrium is Etruscan in origin seems to find support in the internal arrangement of some tombs and certain cinerary urns in the form of houses. Sepulchral architecture, however, is well documented. Contemporaneous with the cremation shaft grave, the pit grave developed in the Villanovan area; the latter evolved into the chambered tomb, which from its oldest known example, the 7th-century B.C. Regolini-Galassi tomb at Cerveteri, continued into the 3d century without ever totally eliminating cremation rites. During the Orientalizing period, the burial chamber was partly dug from the earth and partly covered by an ogival vaulting. Later the chamber was entirely dug from the earth. In some areas, especially Cerveteri, the tomb was surmounted by an artificial mound. Usually the chamber walls were painted, as at Tarquinia, Veio, Vulci, and Chiusi (anc. Clusium), but at Cerveteri architectural decoration prevailed. A type of external architectural decoration was employed in the necropolises carved into the rock hillsides at Norchia, Castel d'Asso, Sovana, and other places.

Etruscan art and culture, mixed with that of the Greeks, exercised a major influence on the neighboring regions of Umbria and Latium as well as on Campania.

c. Roman Italy. From their beginnings the culture and art of Rome and Latium played an important part in the history of early Italy. Rome seems to have had a notable development during the archaic period, under the Etruscan monarchy of the Tarquins. Some noteworthy monumental remains have been preserved from this period. A period of decline followed, and only after the destruction of the neighboring Etruscan city of Veii (396 B.C.) and the invasions of the Gauls (390 or 387 B.C.) did Rome regain a prominent position in Latium and begin its expansion throughout the peninsula. Roman legions moved to the south and after a very hard struggle defeated the Samnites and their allies — Gauls, Etruscans, and Umbrians — in the Battle of Sentinum (295 B.C.). The Roman menace to the Greek cities of Italy provoked the intervention of Pyrrhos, but the long war ended in victory for the Romans at Beneventum in 275 B.C. By the middle of the 3d century B.C., through conquest or pacts of alliance, Rome had gained control of the entire Italian peninsula from Pisa and Rimini to the Strait of Messina. By passing from the peninsula into Sicily, Rome provoked the struggle with Carthage: the First Punic War (264–241 B.C.) resulted in the acquisition of Sicily, which became Rome's first province, and shortly thereafter of Sardinia (238 B.C.). There followed the invasion of the Po plain and the fight against the Gauls. The Second Punic War (218–201 B.C.) sorely tried the unity of the federation of Italian cities, but its outcome made Rome a world power. The recapture of those parts of the Po Valley lost in the Second Punic War and the defeat of the Ligurians completed the Roman conquest of Italy; then began the conquest of the Mediterranean and of Europe.

The granting of Roman citizenship to the Italian peoples at the beginning of the 1st century B.C. accelerated the Romanization of Italy. The civil wars brought grave destruction to many of the Italian cities which participated in the fight, but under Sulla and later under the Triumvirates many were reconstructed and given new fortifying walls. In 42 B.C. the borders of Italy were extended from the Magra and Rubicon Rivers of Sulla's time to the Var River (Lat., Varus) to the west and to the Arsia in Istria to the east; in the Alps the boundary passed through Mount Viso, the Great and Little Saint Bernard and Saint Gotthard passes, the Splügen Pass, the upper valleys of the Adige River, the Isarco River, and the Carnic Alps. For administrative purposes Augustus divided Italy into regions (see below, *Historical geography of Italy*). The islands and parts of the Alpine chain continued or were organized as provinces. Under Augustus not only Rome but many other Italian cities saw the creation of monumental structures. Notable building activity continued in the following centuries in spite of the fact that with the development of the Roman Empire the economic and political importance of Italy gradually diminished: under Caracalla the provinces were made equal to it, under Diocletian it was made one of the twelve dioceses, and thereby lost its position as the center of the Empire. The barbarian invasions which devastated Italy many times, especially in the 5th century, caused widespread destruction and led to the depopulation of many cities. But the fall of the Roman world did not destroy urban life; it continued through the Middle Ages, and, in fact, the Roman plans of many cities were preserved. Late-antique art also continued to flourish, though turning to Christian themes, and some remarkable monuments were produced in architecture, sculpture, painting, and mosaics.

The contribution of Rome to the civilization of Italy was from the beginning a dynamic one, continually developing and altered by interaction with elements in the Italian culture. In religion new divinities and cults were introduced from Etruria, Magna Graecia, and the Italic cultures and were in turn disseminated by the Romans; for example, the Capitolium (with the worship of the triad of Jupiter, Juno, and Minerva), which was the supreme expression of Roman religion and was introduced in all the colonies almost as if to sanctify Roman rule, was probably Etruscan in origin. A major Roman contribution to city planning was the creation of a centralized rectangular plan, traversed by two perpendicular main avenues (the *cardo* and *decumanus*) with the forum usually at the center; the intersecting secondary streets formed almost square blocks which were often two *acti* long. The oldest example of this type of plan is Ostia (mid-4th cent. B.C.); later examples are Minturnae (Minturno) and Pyrgi (Santa Severa); a variant inspired probably by the castrum plan places one of the axes off center, as in Turin and Aosta. Also widely adopted was a modified Hippodamian plan in which the central axes do not predominate, the blocks are long and narrow, and the perimeter is irregular [Norba, Alba Fucense (mod. Albe), and Cosa (mod. Ansedonia)]. During the early centuries the cities founded by Rome reflected the exigencies of military life, and expressions of monumentality were limited to walls and temples. In later centuries of the republic there was more extensive urban development. In the 2d century a monumental architecture was developed, especially in Latium, which, while drawing on Hellenistic precedent, brought new spatial values and an extraordinary scenographic sense to architecture, thanks in part to the perfection of vaulting and the use of concrete. A typical example is the Sanctuary of Fortuna Primigenia at Praeneste (mod. Palestrina; VII, PL. 199).

The administrative structure of the cities reflected that of Rome and brought about the creation of relatively uniform types of public buildings (the *curia* for the assembly of the *decuriones*, the *comitium* for the elected representatives, and the basilica for judicial functions). The cities were no less attentive than Rome in their concern for the roads, public services, and the aqueducts and cisterns vital to the water supply. They constructed strong walls with monumental portals which, during the 4th and 3d centuries B.C. and perhaps in the civil wars, were intended to serve for defense purposes; but afterward the monumental portals seem to have acquired the function of consecrating the city (e.g., in the Augustan era). In some places civil and cultural developments were in advance of those in Rome: theaters and amphitheaters were being built in Campania perhaps as early as the 1st century B.C., and thermal establishments appeared in the provinces before they did in Rome. It was Rome, nevertheless, that was responsible for disseminating these developments to the minor isolated centers. The atrium house developed from Etrusco-Italic and Hellenistic elements, but with the rapid growth of cities there was born a new type of housing — the insula or apartment house — which was particularly adapted to such overpopulated centers as Ostia. Various types of tomb architecture developed: quadrangular monuments, pavilions, exedrae, and columns, all Hellenistic in origin; pyramids; circular mausoleums inspired by Etruscan tumuli; and chambered tombs and columbaria.

During the 2d and 1st centuries B.C. closer contacts with the Greek world had a decisive influence on art: Greek works were imported; as a result Greek artists were employed in Italy, and Neo-Attic schools were formed (see HELLENISTIC-ROMAN ART; NEO-ATTIC STYLES). Beginning in the 2d century B.C., Greek influence can be clearly seen in religious and decorative sculpture, paintings, and mosaics (especially in Campania), decorative terra-cotta plaques, silverwork, and relief ceramics (e.g., the Arretine workshops). In architecture, however, a new disposition for spatial effects gave prominence to the arch and the vault — both Italic elements. Local traditions found expression in votive and funerary portraits, tomb reliefs, and paintings of popular, secular subjects (see ITALO-ROMAN FOLK ART).

During the Imperial period architecture exhibited both classicizing (traditional preference for straight surfaces and right angles) and more strictly Roman tendencies (curvilinear plan, functionalism, spacious interiors). In the other cities the ties with Rome became increasingly obvious, not only in the monuments erected by the emperors but also in the buildings constructed on local initiative. The classicizing tendency is especially evident in the Augustan and Antonine periods and in certain types of structures, particularly the temple. The imaginative use of space began under Nero and continued until the end of the Empire. Especially original solutions were achieved under Hadrian, and baroque tendencies developed

under the Flavians and Severi. Functionalism found its best expression in private buildings (e.g., insulae) and commercial premises.

In freestanding sculpture, particularly in statues of divinities, Greek forms remained dominant. But historical reliefs attained a high level of originality (from the time of Augustus, and particularly under Domitian, Trajan, and Marcus Aurelius) in their vibrant representations of real events and in their experiments with spatial illusionism. An interest in profound personal characterization resulted in a remarkable development of portraiture (see ROMAN IMPERIAL ART).

Throughout Roman art there is an evident contrast between the classicizing tendency of official art (which in some periods was accentuated in coldly academic forms or a refined eclecticism) and the tendency which continued the pictorial and expressionist characteristics of Italic art. The latter tendency was that of popular art and certain isolated centers, but it gradually began to shape the course of official art, reaching an apex toward the end of the 2d century (e.g., Column of Marcus Aurelius) and passing into late-antique art in the 3d century. The late-antique style gathered together and summarized in new and universal forms the artistic experiences of the Romanized world, absorbing Eastern and provincial traditions as well (see LATE-ANTIQUE PERIOD). The period from the late 3d to the early 5th century marks the last great phase of ancient monumental development in Italian cities — in Rome, above all. Some of the most spectacular surviving Roman structures, both civil and religious, are from this late period.

Ferdinando CASTAGNOLI

The Middle Ages: a. Early Middle Ages. With the spread of Christianity the classic modes of expression did not disappear but instead were readily adapted in the selection of themes and symbols to the needs of the new religion, especially in funerary painting (see CATACOMBS) and in sculpture. After the Edict of Milan (A.D. 313), which assured freedom to Christians, the first monumental sacred buildings were built in new forms suited to Christian liturgy and practices. Thus the first sacred basilicas and baptisteries were built, often on the sites of older classical buildings and incorporating Roman remains. The cities retained the Roman city plan, but the center tended to be displaced from the forum to the site of the most important religious edifice: in Rome, for example, the center moved from the Forum to St. John Lateran. Funerary monuments continued to be constructed outside the city walls; cemetery shrines and mausoleums followed late-antique forms (e.g., S. Costanza, Rome) and cemetery basilicas took the form of churches (e.g., Old St. Peter's, S. Paolo fuori le Mura, Rome). Churches were often built on sites of private halls which had been previously adapted for Christian use (halls of Theodore at Aquileia). The central plan, though widespread in the east, was used in Italy mainly for baptisteries (St. John Lateran, Rome; Novara; Albenga; S. Giovanni in Fonte, Naples); for churches the basilican plan was preferred, except for rare cases such as S. Stefano Rotondo in Rome and S. Angelo in Perugia. The interiors of these buildings were adorned with wall mosaics originally exhibiting either a lively decorative character (S. Costanza, Rome) or a solemn classical monumentality (S. Pudenziana and SS. Cosma e Damiano, Rome), but always tending more toward abstract forms influenced by eastern motifs (triumphal arch of S. Maria Maggiore, Rome) and sometimes achieving a refined aniconic symbolism (Baptistery of Albenga, church at Casarenello). Many churches boasted fine polychrome mosaic pavements (halls of Theodore at Aquileia).

The transfer of the western capital of the Empire from Rome to Ravenna in 402 brought about a building surge in Ravenna, the impetus of which lasted until the mid-6th century. These new structures (Mausoleum of Galla Placidia; the churches of S. Vitale, S. Apollinare Nuovo, and S. Apollinare in Classe; the baptisteries of the Orthodox and of the Arians) were in a local interpretation of Byzantine style (see BYZANTINE ART) and were characterized by a pictorial and luministic unity of architecture and mosaic decoration which even influenced later monuments, especially along the north coast of the Adriatic. The presence of barbarian tribes in Italy (Ostrogoths and Lombards, 6th–9th cent.) left its mark in gold- and silverwork (see EUROPE, BARBARIAN), but for the most part the barbarians fell under the influence of late classical tradition (Mausoleum of Theodoric at Ravenna) due mainly to the conversion work of the Church and assimilation with the local peoples (see PRE-ROMANESQUE ART). Urban centers fell into decay and began to be depopulated, so much so that architecture entered a period of stagnation. A few Lombard centers (Castelseprio) and monastic churches of the period (S. Salvatore, Brescia; the Tempietto, Cividale) testify to the impoverishment of building techniques. Sculpture developed a certain coarseness, revealed in the ornamental interlace motifs and intense decorativism that give a completely different tone even to those elements derived from classical art (Altar of Ratchis, Cividale).

The Carolingian renaissance (9th cent.) significantly changed the situation, as indicated by the wealth of valuable Carolingian art which remains. Rather than being all-encompassing, the revival tended to express itself in isolated phenomena, as, for instance, the widespread use of crypts as reliquary chapels and the rare creation of double-choired basilicas (Farfa) and simple hall churches in the Alpine zone (Malles). Goldsmith work was of major importance, and Milan seems to have been a center of activity in that art: the famous "iron crown" of Monza (VI, PL. 260) was probably made there, as was the golden altar of S. Ambrogio (III, PL. 63; see CAROLINGIAN PERIOD). The structure of small north Italian centers began to be determined in this period: the church and its piazza was the center around which the towns were built; monastic foundations were built in isolated places. These monastic centers (often mentioned in medieval literature) were composed of a church, living quarters for the monks, a few chapels, and a hospice or guest rooms for pilgrims and were important centers of culture and land reclamation. Famous monasteries in southern Italy were those at Monte Cassino, San Vincenzo al Volturno, and Cava dei Tirreni; in central Italy, Ferentillo; and in northern Italy, Pomposa, San Giorgio (near Sant'Ambrogio di Valpolicella), and Sesto al Reghena. During the same period eastern asceticism spread in those parts of the south that had ties with Byzantium, as evidenced by the numerous cave-chapels, many with frescoes of a later date. The gap between northern and southern Italy is marked both geographically and, in a certain sense, figuratively by Rome; there in the 8th and 9th centuries architecture turned to Early Christian models for inspiration (e.g., Chapel of S. Zenone in S. Prassede; S. Maria in Domnica). In the 10th century the economic system of the peninsula, strongly based on agriculture (in part because of the Arabs' domination of the Mediterranean), continued to contribute to the depopulation of urban centers. This situation was intensified in the development of feudalism, which was responsible for the first fortified castles, which were strategically located and sometimes as isolated as monasteries. It was rare, however, that Italian monastic centers and castles fostered the foundation of towns around them, as was often the case in the northern countries. But in the 10th and 11th centuries, under the Ottonians and Salians (see OTTONIAN PERIOD; PRE-ROMANESQUE ART), there was a reaction in Italy against the feudal system; this reaction was encouraged by a revival of commercial activities. There was a consequent resumption of city life, characterized by a desire for freedom and economic independence (on the model of maritime republics). As a result, a genuine architectural revival in civil and religious building took place in the 11th century.

b. Romanesque period. During this period (see ROMANESQUE ART) almost all Italian cities seem to have built or rebuilt their main churches; usually the episcopal palace was built next to the principal church and often shared a piazza with the *palazzo comunale*, or town hall. Cities began to expand and develop haphazardly: narrow twisted streets — leading past porticoed houses, never more than two stories high, with ground floors given over to shops — flowed from the main piazza into the minor ones, where chapels or small churches were usually located. Feuds between cities prompted the construction of fortified city walls with towers and gates, sometimes built upon the ruins of the ancient Roman wall or restored from the pre-Romanesque defensive system. The uneven configuration of the terrain fostered the construction of a citadel at the center of the city in some areas (mainly Umbria, Tuscany, and Latium); later, in the period of the seigniories, the citadel became the seat of the lord. Private feuds between families were responsible for the development of the tower-house — a structure uniquely suited for defense; these buildings came to dominate the sky line of many medieval Italian cities (e.g., Bologna, Pisa, Volterra, San Gimignano, and Viterbo).

Contemporaneous with the political and economic revival was a religious awakening, effected particularly through the work of the Dominican and Franciscan orders. Monasteries were enlarged and renovated, hospices were increased, and new foundations arose, which, except those of the contemplative orders, were not erected in isolated areas but on the edges of cities; often later extensions of the city walls would bring the monasteries within the orbits of the cities. Thus, church campaniles stood alongside tower-houses and gave a particular aspect which many Italian cities still retain.

The first intensive period of building activity was centered in Lombardy, where the workshops of the lake district, which had been active in preceding centuries (e.g., the *magistri comacini*), organized themselves into genuine guilds (e.g., the *magistri antelami*; see INSTITUTES AND ASSOCIATIONS). They worked in numerous cities where there first arose sacred buildings (S. Ambrogio in Milan, 11th cent., is considered the fundamental example) and then, with the development of the communes, the communal palace. These masters, who were both builders and stone cutters, worked outside Lombardy as well, in Emilia, along the Adriatic coast, and even in southern Italy, where in the 11th century they were commissioned, among others,

by Abbot Desiderius of Monte Cassino. The style of the new buildings was characterized by a massiveness and volumetric quality partly resulting from an extensive use of the groin vault; the distinguishing features of the architecture included the characteristic three apses (the main one at the center and one at the head of each of the side aisles) and blind loggias decorating both the façade and the apse exteriors and sometimes enlivened with zoomorphic ornament with reminiscences of barbarian art.

The autonomous Italian communes, following the example of the maritime republics, also sought to express their artistic individuality. Thus the character of Romanesque art varied according to region. In the Veneto the plastic forms of Lombardy were softened (e.g., Verona, S. Zeno). In Venice connections with the east resulted in a unique expression of forms (S. Marco). In Florence the persistence of the classical tradition stimulated a system of architectural decoration consisting of polychrome marble arranged in strictly ordered geometric patterns (S. Miniato al Monte; the Baptistery). While sharing the chromatic taste of Tuscany, Pisa felt eastern and Lombard influences and developed a decorative system involving the regular multiplication of façade loggias (Cathedral; Baptistery, campanile). This motif was taken up at Lucca but with a distinctive character (Cathedral, S. Frediano). In Latium the Cosmati (q.v.) revived the late-antique art of *opus sectile*, decorating doorframes, pavements, ambos, Paschal candlesticks, and cloister columns in a lively manner (e g., St. John Lateran, S. Paolo fuori le Mura, both in Rome); the portico of the Cathedral of Civita Castellana contains some of the most remarkable work of the Cosmati. Also in central Italy the first city government buildings were built flanking the religious structures; these civic structures were built in solid masonry and had narrow windows or superimposed loggias (Palazzo della Ragione, Pomposa; Palazzo del Popolo, Orvieto; Palazzo del Comune and Palazzo del Podestà, Massa Marittima; Palazzo del Popolo, Todi).

In southern Italy there was a mixture of numerous influences: Byzantine, Islamic, Lombard, and Norman. The Norman influence was especially prevalent in Apulia and Sicily, where Norman churches (Bari, Palermo, Monreale, Cefalù) are characterized by closely knit masonry work and façade or corner towers. The red domes of Moorish masonry distinguished Sicilian buildings, while Campanian churches were adorned with splendid pulpits, decorated with vibrantly colored mosaic, ornamental sculpture, and intricate marble inlays in geometric designs. In the 13th century Frederick II fostered a revival of classical motifs in southern Italy and Sicily (see ANTIQUE REVIVAL). His building program was particularly intense in civil architecture. In almost every city castles were constructed, some with clear French influences (e.g., Gioia del Colle). Frederick's architectural masterpiece was Castel del Monte, designed as a hunting lodge, which has elements that herald Gothic style. Benedictine monasteries continued to be built in isolated areas; the foremost of them was Monte Cassino, rebuilt by Abbot Desiderius. It served as a model for several other foundations (S. Angelo in Formis), and the Byzantine artists summoned by Desiderius to decorate his church brought a revitalizing spirit to painting (S. Angelo in Formis;

II, PL. 285), miniatures (Exultet Rolls of Monte Cassino, Salerno, etc.), and mosaics throughout southern Italy and Sicily (Cefalù, Palermo, Monreale). The polychrome Basilian country churches in Sicily, in Calabria, and in Lucania reflected Byzantine influence. Thus the various regions of Italy continued to develop their own characteristics, adapting in different and original ways the forms of Romanesque taste.

c. Gothic period. Gothic architecture was introduced into Italy by the Cistercian order and first appeared in single structures: the abbeys of Fossanova and Casamari in Latium; San Marino al Cimino in Umbria; San Galgano in Tuscany; Chiaravalle di Fiastra and Chiaravalle (S. Maria di Castagnola) in the Marches; Chiaravalle della Colomba in Emilia; and Chiaravalle near Milan (see GOTHIC ART). The earliest manifestations were simple and severe, in accordance with the austerity of St. Bernard of Clairvaux. The Franciscan and Dominican mendicant orders readily adopted Gothic forms for their churches. These were modest structures, usually of brick, the soaring quality of the vaults being checked by an emphasis on the horizontal procession of arches and piers along the nave and aisles (S. Maria Gloriosa dei Frari and SS. Giovanni e Paolo in Venice; S. Anastasia and S. Fermo in Verona; S. Francesco in Bologna; Sta Croce and S. Maria Novella in Florence) or along the single nave (S. Domenico in Siena, Church of the Eremitani in Padua). Southern Italy only rarely adopted elements of the new style, but in north-central Italy, alongside the churches of the predicant orders, there developed a sacred architecture modeled after that of French cathedrals. Their elegance and pomp was rendered in the new architecture with a sobriety that was completely Latin. The cathedrals of Florence, Orvieto, and Siena are the masterworks of this development. Even the most conservative Lombard workshops adopted the new style, albeit retaining Romanesque elements; but the most outstanding Gothic monument of Lombardy is Milan Cathedral, which, in part because of the collaboration of foreign architects, conforms to French and German models. In many Italian cities monuments begun in the Romanesque period were continued and completed in the Gothic period, consequently blending the styles of the two periods (baptisteries of Pisa and Parma, Cathedral of Ferrara, Cathedral of Trent). The architecture of some regions is marked by the presence of elements derived from dissimilar traditions: for example, the presence of the domes in S. Antonio in Padua reveals a lively and flourishing contact with the Byzantine world, and the exterior of the Cathedral of Palermo is clearly linked to Spanish Gothic.

Urban construction especially flourished during the Gothic period. The most beautiful communal palaces in Italy were built then (Perugia, Gubbio, Viterbo, Siena, Florence); they were generally three stories high with rhythmically placed lancet windows and often flanked by high towers. In northern Italy the plan developed during the Romanesque period was retained for these government buildings: open ground-floor loggias and large windows in the second floor (Piacenza; Palazzo Ducale in Venice). The battlements crowning the structures were holdovers from fortress architecture. The revival of commerce brought about the construction of loggias which were actually markets (e.g., the loggia of the Palazzo della Mercanzia, Bologna; loggia, Narni); the main square was usually adorned with a monumental fountain (Perugia, Siena); roadside tabernacles were constructed in quantity. Sepulchral monuments, in the traditional Gothic form of elevated tombs covered by carved canopies, achieved extremely high levels of quality, particularly in Bologna and Verona (e.g., the Tombs of the Scaligeri, I, PL. 380; III, PL. 21).

With the transition from communal government to rule by lords (14th cent.), castles of the old feudal type were again required; fortified palaces, surrounded by walls and defensive structures, were sometimes built in the heart of the city, for example, the Castelvecchio in Verona and the original nucleus of the Castello del Buonconsiglio in Trent. Castles guarding mountain passes were erected in isolated spots in Trentino, Alto Adige (Castel Tirolo, or Schloss Tirol; Castel Roncolo, or Schloss Runkelstein), and Piedmont (Castle at Fénis). In the south the Angevins continued the work of Frederick II, fortifying as bridgeheads to the east the castles the Emperor had built (e.g., at Lucera).

About this time private construction reflected the emergence of a wealthy *bourgeoisie*. Particularly in northern and central Italy, there began to be constructed larger and more comfortable dwellings of two and three stories with single- and double-mullioned windows. These residences were built along the main streets, which were widened in this period. Such a residence is the Palazzo Davanzati in Florence. One of the most refined of such dwellings, the Ca' d'Oro in Venice, foreshadows the taste though not the style of Renaissance bourgeois buildings. Venice itself found the Gothic style particularly suited to its unique character. In northern Italy 14th- and 15th-century houses were enlivened with balconies and external stairs and usually included small inner courtyards with central wells. This was not the case in southern Italy, however, where except for some late Angevin structures with Spanish Flamboyant Gothic influences (Carinola), private dwellings continued to be modest buildings falling short of art. Nevertheless, the southern Italian towns owe their present appearance fundamentally to the medieval period, and they are dominated even today by the monumental churches around which are gathered even the humblest private dwellings. In central and northern Italy the more prosperous economy of the 14th century determined the fundamental structure of cities and towns; thus, imposing public buildings were erected along with the churches, and notable private dwellings were built, many of some originality.

Modern period. a. The Renaissance. The first tentative approach to Italian national unity was embodied in the ambitions of Gian Galeazzo Visconti, duke of Milan. Most of the powerful families of the time were avid patrons of the arts: the House of Aragon in Naples welcomed Tuscan artists; the Gonzaga family of Mantua were Mantegna's patrons; the Montefeltro family brought to Urbino Luciano Laurana and Tuscan, Flemish, and Spanish artists; and the Este family of Ferrara patronized Biagio Rossetti, who developed the first systematic urban plan. The court of the Medici in Florence was full of artists, writers, and politicians. The love of learning spread rapidly, and the private dwelling evolved into the Renaissance gentleman's palace, a model for the rest of Europe, which was just beginning to emerge from the Middle Ages. The bonds with an-

tiquity were strengthened in the Renaissance (q.v.) in the desire to revive in new forms the grandeur of Rome; Humanism paralleled this sentiment with its love for ancient objects and writings. Florence was the chief seat of this new culture, which was also fostered by the papal courts of Julius II, Leo X, Clement VII, and Paul III, who commissioned such artists as Raphael, Bramante, and Michelangelo.

In the 16th century Piedmont, Lombardy, the Venetian Republic, the Papal States, and the Kingdom of Naples and Sicily continued

their independent political existences. The larger European countries, such as Spain and France, had consolidated themselves as nations and began to vaunt their respective hereditary rights to certain Italian states. The foreign conquests in Italy were begun at the end of the 15th century by Charles VIII of France, continued by his successors, opposed by Emperor Charles V, and concluded in 1559 with the peace of Cateau-Cambrésis, which confirmed Spanish dominion in Italy from Milan to the Kingdom of Sicily. Venice remained independent, having since the 10th century extended its own dominion over the Venetian mainland and into part of Lombardy and having survived the invasion of 1509 of Emperor Maximilian and the League of Cambrai.

The first center of the Renaissance was, as mentioned above, Florence. In architecture two currents began to take shape there in the early 15th century: that of the lively linear impulse of Brunelleschi (q.v.) and that of the Humanist Leon Battista Alberti (q.v.). The two artistic traditions came together in the work of the Sangallo (q.v.) family of Tuscany, who achieved a new grandeur in architecture by the use of smoothly finished massive façades accented with windows (Villa of Poggio a Caiano, PL. 428; I, PL. 305; Palazzo Farnese in Rome). From Michelozzo in Florence and Laurana in Urbino they borrowed new systems of proportions, which they applied to palace courtyards. They elaborated the Greek-cross plan for churches; S. Maria delle Carceri, in Prato, S. Biagio, in Montepulciano, and S. Maria della Consolazione, in Todi, paved the way for Bramante's plan for St. Peter's in Rome. Bramante (q.v.), after his early experience in the Marches and Milan (at the Sforza court, where his contact with Leonardo da Vinci had far-reaching results on his career), became the leading exponent of the new classicism. In his design for the Cortile del Belvedere in the Vatican, Bramante placed three orders one above the other in the manner of Roman Imperial façades, and his plan for St. Peter's consisted of a Greek-cross plan inscribed in a square and surmounted by a large central dome with four smaller domes at the corners of the arms, a scheme ultimately deriving from Byzantine sources. The pilasters and paired columns on huge bases, designed by Bramante and Raphael (q.v.), were used in the Ca' Corner and Sansovino's Ca' Grande in Venice and became distinctive elements of Venetian baroque religious architecture.

Michelangelo (q.v.), departing from the Tuscan dichromatic tradition, introduced a new tension in Florentine architecture. His work in architecture and city planning culminated in the perspective arrangement of the Capitol in Rome. The development of new forms in Rome was of particular importance for Venice and Mantua. After the sack of Rome in 1527, it was in Venice that Sansovino applied his talents to the Biblioteca Marciana and the Loggetta di S. Marco. The work of Giulio Romano (q.v.), painter and architect at the Gonzaga court in Mantua, and of Michele Sanmicheli (q.v.) in Verona and Venice balance the classical tendency and the creation of original new forms. Giulio Romano, in his Palazzo del Te in Mantua (PL. 428), reflects the influence of the Villa Madama in Roma; Sanmicheli, a military architect and city planner, exhibits a classicizing tendency in the Palazzo Canossa, Palazzo Pompei, and the Pellegrini Chapel (S. Bernardino), all in Verona, while in the Palazzo Grimani (now Court of Appeals) in Venice and the Palazzo Bevilacqua in Verona he displays a taste for chiaroscuro effects. Palladio (q.v.) followed in the Humanist tradition of Alberti. In Palladio's architecture in Vicenza and Venice and through his *Quattro libri dell'architettura*, he transmitted this tradition, distilled directly from Roman Imperial sources and Renaissance developments, to later generations of Europeans and Americans. His villas, which in their isolation and independence easily assimilated classical as well as functional elements, were the forerunners of modern dwellings. He achieved new chiaroscuro effects by placing a deep porch before the façade of the villa, thus introducing a new and entirely personal development. The villas were frescoed with subjects from classical myths and heroic poems. In Vicenza the dynamism of the Basilica, the airy loggias of Palazzo Chiericati, the soaring quality of the arcades in the courtyard of Palazzo Thiene (now the Banca Popolare), the functional and classical interpretation of the Teatro Olimpico, and the development of thermal plans created a new atmosphere.

In the 16th century villa architecture also flourished in Lombardy (La Simonetta, outside Milan); Galeazzo Alessi built several villas and palaces in Liguria, mainly in Genoa, often embellished with light arched loggias and external frescoes. Renaissance villas adorned Naples, Florence and Tuscany (Villa di Artimino by Buontalenti), and Latium (Palazzo Farnese at Caprarola by Vignola; Villa Lante at Bagnaia, PL. 433); surrounded by green parks and gardens with statues and flowing fountains, these villas were the settings for the lives of 16th-century lords.

The late Renaissance was marked by the adaptation of earlier developments to large buildings that, because of their functional purposes and requirements, became less works of art than exemplifications of a highly sophisticated taste. In urban design the Procuratie Nuove in Venice (PL. 214) with which Scamozzi completed Piazza S. Marco (I, PL. 402), and the Uffizi in Florence (IX, PL. 312) by Vasari were noteworthy achievements. Among the functional structures produced in the 15th century were the hospitals, with an altar and a ciborium at the crossing (e.g., Sto Spirito, Rome; the former Ospedale Maggiore, Milan). The old hotel Scudo di Francia in Vicenza was built in the 16th century and the first Monte di Pietà (designed for Feltre) was erected in Belluno. In northern Italy in the late 15th and early 16th centuries many important irrigation plans (some the work of Leonardo and Fra Giovanni Giocondo) were carried out. Notable urban designs include that of Pienza, commissioned by Pope Pius II, and the work of Biagio Rossetti in Ferrara. Important, too, was the urban design of Vigevano — linking castle, tower, and piazza — which incorporated innovations at the end of the 15th century. In Rome Pope Sixtus V (1585–90) opened the great avenue from the hill where the SS. Trinità dei Monti is located to S. Maria Maggiore and the Lateran. In the 17th century in Turin the Savoy dukes laid out over the Roman grid plan a frame of streets and piazzas, based on French models, creating a coherent and unified city plan. Each Italian state had its sumptuous seats: that of the

Doges in Venice (14th–15th cent.); the Visconti family in Milan, Pavia, and Vigevano; the Sforza in Milan; the Este in Ferrara; the Malatesta in Rimini; the Montefeltro in Urbino and Gubbio; the Medici in Florence; the House of Aragon, the Spanish Viceroys, and the Bourbons in Naples, Palermo, and Caserta; the House of Savoy in Turin, Moncalieri, Racconigi, Stupinigi, and Venaria Reale.

The idea of bastioned fortifications — in masonry and terreplein construction, providing less of a target for artillery bombardment — seems to have been Francesco di Giorgio's. They were constructed by Giuliano da Sangallo (Nettuno), Antonio da Sangallo the Elder (Civita Castellana), and Baccio Pontelli (castle at Ostia). Castel S. Angelo in Rome was transformed into a fortress in the 15th–16th century; it had served as a model for the Venetian fortress at Monfalcone (15th cent.). Important because of its polygonal form is the fortress of Palmanova (16th cent.). Circular keeps continued to be built, in part over Venetian structures, until the 19th century, under the Austrian rulers of northern Italy. Fortified churches were common: Monte Cassino and Bobbio (both early medieval), the Sanctuary of SS. Vittore e Corona (near Belluno), Sesto al Reghena (near Udine), and Loreto. Cities were reopened, and fortifications were built along the territorial borders: for example, the towers built by the Venetians (beginning in the 15th century) to guard the border valleys from the Austrians. In Naples, the Castel Nuovo was embellished with the triumphal arch of Alfonso of Aragon (III, PL. 390); elsewhere fortified structures were transformed into castle-palaces, as those of the Este family in Ferrara, the Montefeltro in Urbino, and the Medici and Strozzi palaces in Florence. Those outside towns became castle-villas, as the Careggi and Cafaggiolo villas near Florence and the immense Cataio near Padua. In the 16th century crenelated towers were built in those sensitive areas most exposed to the Saracens — along the Amalfi coast and the shores of Latium and Liguria.

b. Baroque. In the 16th century Rome answered the challenge of Protestantism with the Counter Reformation, and throughout the 17th and 18th centuries continued with unabating energy its campaign for unity of dogma and presentation and against innovation in government, philosophy, and science; the reforms and policies formulated at the Council of Trent were disseminated throughout Europe and America. Having become the center of a powerful court, Rome took full advantage of the new baroque style (see BAROQUE ART) in the works of such men as Bernini, Borromini, Pietro da Cortona, and Rainaldi (qq.v.), artists whose vibrant sculptural sensitivity had its roots in classical tradition.

During the period after the Treaty of Cateau-Cambrésis (1559), Lombardy, the Kingdom of Naples, and some smaller states were subject to Spanish influence. The victory at Saint-Quentin brought prestige to the duchy of Savoy, which subsequently entered the sphere of French influence. Turin was then considered the first modern city in Italy. It experienced an architectural efflorescence beginning in the 17th century, which was noteworthy especially for the functionalism of its apartment buildings and for the design of its squares and streets (Piazza San Carlo, designed on the model of an ancient Roman forum, Piazza Castello, and the present Via Po), all conceived in unified architectural forms, dominated by the masterpieces of Guarino Guarini and Filippo Juvara (qq.v.).

With the Treaty of Aix-la-Chapelle in 1748 an official division of the country between Spain (Naples and Sicily) and Austria (Lombardy, Tuscany, Parma, Piacenza) was agreed upon. At first Austrian rule was well received because of the enlightened attitude and many reforms of Maria Theresa, particularly in Milan, which had declined under the Spanish domination, and because of the summoning of many Italian writers and artists to the Austrian court. The baroque style of Bernini and, more especially, Borromini spread through England, Poland, Russia, and the Americas. Venice, victorious over the Turks at Lepanto (1571) and successful in the reoccupation of its territories in the Peloponnesus (1685–1715), revealed a keen taste for art and continued to dominate the scene with Baldassarre Longhena, G. B. Piazzetta, the Tiepolos, Canaletto, the Guardis, and the Longhis (qq.v.). Meanwhile, the rococo was imported from France and, with its pastel colors and *rocaille* stucco, was readily adopted in Venice.

The development of the baroque was heralded by Michelangelo, who, with the Biblioteca Laurenziana (Florence), the statue of Moses (Rome, S. Pietro in Vincoli), and the dome of St. Peter's, created a new vision of plastic space articulated and set in motion by alternating volumes and voids. Parallel to the Counter Reformation the new style monumentally affirmed the renovated life and authority of the Church. In the 17th century Bernini continued the monumental affirmation of the Counter Reformation with his elliptical St. Peter's Square (I, PL. 403), whose powerful Doric columns and dynamic portico were almost concrete expressions of the expanding power of the Roman Catholic Church. The conception of Borromini's Roman façades and interiors presupposed an inner vitality of matter. After Michelangelo's ingenious design for S. Maria degli Angeli, laid out within the tepidarium of the Baths of Diocletian, the spatial possibilities of thermal architecture began to be explored in Rome, first in Vignola's interior of the Church of the Gesù and later, in a lighter idiom, in the aisles of S. Ignazio. The lively but soothing structure of S. Maria in Campitelli, by Rainaldi (I, PL. 405), and the vigorous chiaroscuro effect of the façade of S. Maria in Via Lata (XI, PL. 172), by Pietro da Cortona, exemplify the full Roman baroque, which subsequently showed signs of decline in the mannered repetition of fixed schemata. There was a revival in the 18th century, inspired by a taste for perspective effects, that produced the Spanish Steps of the Trinità dei Monti, the Fontana di Trevi, by Nicola Salvi (1762), display architecture in general, theater and festival displays, and the neo-Palladian façade with which Alessandro Galilei completed St. John Lateran.

In Naples the spatial designs of Domenico Fontana attained a remarkable fusion of solemnity and ease in the Royal Palace. Luigi Vanvitelli employed a more varied system of forms in his design for the Royal Palace in Caserta, imbuing it with a light grandeur beautifully complemented by the magnificent perspective of the park, embellished with statues, grottoes, and waterfalls (I, PL. 389). Inspired by Roman models, baroque architecture spread through southern Italy and Sicily: for example, the Quattro Canti (Piazza Vigliena) in Palermo and church façades in Naples, Palermo, Catania, and Syracuse. There were original interpretations in the 18th century in Noto and Palma di Montechiaro, and Spanish influence can be discerned in religious and secular edifices in Lecce.

In Turin the baroque was advanced through the works of Guarino Guarini (q.v.), who seems to have been influenced by Borromini and Spanish and Neo-Gothic structural principles in his design for the Palazzo Carignano (VII, PLS. 104, 105), the dome of S. Lorenzo (I, PL. 383), and the Chapel of the Sta Sindone in the Cathedral (I, PL. 421; II, PL. 143; VII, FIG. 196). Juvara in the Basilica of Superga (II, PL. 140) reelaborated with new chiaroscuro effects the Palladian arrangement of a porch with gigantic order preceding the façade; he was also influenced by French models and prepared the way with the Turin Palazzo Madama for the baroque experiments in Madrid. During this period the castles of the Savoy family near Turin, Venaria Reale and Racconigi (VII, PL. 106), were built — either in a severe classicizing or baroque-rococo style — reaching a culmination in the hunting lodge of Stupinigi (I, PL. 389; II, PL. 141), which in its decoration and furnishings reveals French influence.

Venetian baroque, especially the work of Longhena, was influenced by Sansovino in the monumentality of palace structures, but the play of light and shadow on the rusticated ashlar and the vertical thrust of engaged columns represent a different treatment of problems of light. S. Maria della Salute marked a new departure in Venetian baroque with a structure of rich plastic intensity, emphasized by the large volutes under the dome (II, PL. 141). After Palladio's horseshoe-shaped Teatro Olimpico in Vicenza, the first of its kind in modern Europe, theaters with box seating began to appear — the theaters of the Galli Bibienas in Bologna and Pavia, the mid-18th-century Teatro alla Scala in Milan, by Giuseppe Piermarini, and the late-18th-century Teatro Fenice in Venice, by G. A. Selva. The splendor of 16th-century Venetian villas and the even more elaborate 17th-century arrangements of parks with pavilions, tall trees, labyrinths, and lawns attracted the attention of Le Nôtre, who went to Italy in 1679 to study them. Le Nôtre so thoroughly assimilated what he saw that garden architecture returned to Italy as a French fashion. Baroque villa and garden architecture was popular not only in Venice but also in Milan, Turin, Florence, Rome, Frascati, and Caserta — all offering remarkable examples of the fusion of man's work with that of nature. Garden architecture had had further developments elsewhere. Gardens were decorated with figures of monsters, dwarfs (Vicenza, Bagheria near Palermo), and, turning again to artificial and natural landscaping, with artificial grottoes, ruins, and hidden water jets (Valsanzibio, near Padua).

c. Neoclassicism. Neoclassicism in Italy received a decisive stimulus from Winckelmann, who was in Rome from 1755, and from the excavations and discoveries sponsored by the Bourbons of Naples in Herculaneum (1737) and Pompeii (1748), which revived interest in antiquity and collecting. This classical trend spread to foreign countries (particularly to England, through Lord Burlington, who brought back Palladio's designs from Maser) before being widely adopted in Italy, in the work of Alessandro Galilei in Rome and Selva in Venice. The latter imported the "corridor" plan of the middle-class residence from England and thus influenced functional architecture for many years to come. In the mid-18th century, Giuseppe Piermarini's Teatro alla Scala and Palazzo Belgioioso in Milan and Leopold Pollak's Villa Reale marked a return to classical modes, but it was a sterile classicism compared with the inventiveness of the contem-

poraneous work at Caserta. Neoclassicism began in Venice with the designs of Giorgio Massari, whose Palazzo Grassi (now Stucky) and Church of the Gesuati are based on Palladian schemes. Ottavio Bertotti-Scamozzi, who produced an important new edition of Palladio, also turned to neoclassicism. The classicizing style was used in the Napoleonic period not only for the Emperor's monuments (Arch of Peace, Milan) but also for functional works [the Arena (Studio Civico) of Milan, by Luigi Canonica; Pasquale Poccianti's Cisternone (reservoir) in Leghorn]. Giuseppe Japelli deserves mention for the subtle Neo-Hellenic and Neo-Gothic detailing of the Caffè Pedrocchi in Padua (X, PL. 292). The lively urban developments of Giuseppe Valadier (Piazza del Popolo and the Pincio, Rome) and the spatial ones of Antolini (Foro Buonaparte, Milan), concluded this phase.

Neoclassic art in its essential values seemed to have reached its end with the Venetian and Roman work of Antonio Canova (q.v.), but the style continued to be widely accepted and encouraged in Italy even in the romantic period, when northern influences predominated. An interesting, albeit somewhat severe, return to classical forms was marked by Peter von Nobile's interior for S. Antonio Nuovo (1825) in Trieste, derived from that artist's study of Roman thermal buildings (see NEOCLASSIC STYLES).

d. 19th and 20th centuries. The unification of Italy was effected in 1861 and constituted the political affirmation of the cultural and artistic unity that had existed from the Middle Ages and the Renaissance. The Italian state was completed in 1870 with the annexation of Rome. During the 19th and early 20th centuries older styles were revived in Rome: Luca Carimini's romantic neomedieval and Neo-Renaissance styles, the romantic revival of Giuseppe Sacconi in the monument to Victor Emmanuel II (X, PL. 157) and Guglielmo Calderini's neobaroque Palazzo di Giustizia. At the same time Italy saw the widespread diffusion of Art Nouveau (q.v.), whose most influential Italian exponents were Ruggero Berlam (Trieste, Synagogue), Ernesto Basile (Rome, new façade of Palazzo Montecitorio; palaces and villas in Palermo and Catania), Sullam and Giuseppe Torres in Venice, Raimondo D'Aronco in Turin, and Giuseppe Sommaruga in Milan.

More strictly functional designs (railroad stations, ports, airports, mountain and seaside resorts, industrial centers, hospitals, expositions, and highways) were developed in the 19th and 20th centuries in a variety of styles that seemed to reflect the emergence of new elements in society. During the period between the two world wars Italy only gradually began to partake of the more progressive international architecture. Since World War II extraordinary building activity has changed the appearance of cities and countryside to a degree beyond the control of city planners, dramatically exposing the particular problems of modern urban development (see EUROPEAN MODERN MOVEMENTS).

ART CENTERS. *Historical geography of Italy.* Since Roman times the name "Italy" has been used to designate that part of the European continent that forms a peninsula to the south of the Alps (with some variations of boundary). The name was first applied by the Greeks to the extreme southern end of that peninsula, which was inhabited by the Itali. Later the term was extended to all of the southern portion of the peninsula, which came to be known as "Magna Graecia" when the Greeks colonized the area. Thus the ethnic term "Italiote," inhabitant of Italy, came to be applied to the Greek colonists on the coasts of Italy, while the ethnic term "Italici" was applied to the indigenous population of the region. Between the 4th and 1st centuries B.C. the name "Italy" was extended to the entire peninsula south of the Tuscan-Emilian Apennines; the area to the north comprised provinces of Rome. In the time of Julius Caesar the term "Italy" was applied to the peninsula as far as the Alps. Consequently Roman citizenship was extended to the inhabitants of northern Italy, which was included in the province of Cisalpine Gaul. Only with Diocletian's administrative reform did Sicily, Sardinia, Corsica, and the western Alpine territories come to be considered part of Italy. Previously they had been administered as provinces and considered extra-Italian territories. This geographical (and ethnic) concept of Italy as consisting of this entire area survived throughout the Middle Ages and modern times, notwithstanding the fact that the tradition of the Kingdom of Italy created by Charlemagne was essentially that of northern Italy.

The subdivisions of ancient Italy derived from the geographical and physical configuration of the country and, in part, from ethnic and historical factors. The evolution of the various regions was concluded by the Roman unification of the country and its division into eleven regions under Augustus (regions that correspond, for the most part, to the names of the ancient local inhabitants, see ETRUSCO-ITALIC ART): I. Latium et Campania (corresponding to the southern part of modern Latium and Campania); II. Apulia et Calabria (mod. Apulia); III. Lucania et Bruttium (mod. Lucania and Calabria); IV. Samnium (part of Umbria, the Abruzzi, and Molise); V. Picenum (southern part of the Marches); VI. Umbria (Umbria, and northern part of the Marches); VII. Etruria (Tuscany and northern Latium); VIII. Aemilia (Emilia); IX. Liguria (Liguria and southern Piedmont); X. Venetia et Histria (Veneto, almost all of Istria, and eastern Lombardy); XI. Transpadana (northern Piedmont, the Aosta Valley, and western Lombardy).

After Diocletian's reform, some slight variations were effected, with the organization of Italy in dioceses and provinces. Etruria was joined to Umbria under the name of Tuscia or Tuscia Suburbicaria. Picenum was divided into Picenum Suburbicarium (to the south and Flaminia et Picenum (to the north). Transpadana was divided up between Liguria and Venetia. Sicily, Sardinia, Corsica, the Cottian Alps, and Raetia (as far as the Danube) were also included in Italy. The province of Venetia et Histria was extended to the east. For some time, Italy was divided into two dioceses: Suburbicaria (the south) and Annonaria (the north).

On the whole, the ancient division of Italy survived until the end of the Roman Empire and has, with some variations, been revived in modern times, according to historico-cultural and ethnic-linguistic traditions and political administration. The principal modification was effected by the formation of the Lombard states and their contradistinction from Byzantine Italy. The Germanic invasions established the name and concept of Lombardy. The period of Byzantine domination is responsible for the character of Romagna (eastern Emilia, with its center at Ravenna) and Pentapoli (later the March of Ancona, now the Marches).

For several centuries Italy was generally divided into three large areas: the northern and central territories (which had once formed part of the Roman-Germanic empire); the papal region in the center of the peninsula (with the addition of Romagna); and the Kingdom of Naples (later the Kingdom of the Two Sicilies) to the south. Within these larger divisions, the older historical regions did not disappear but reemerged after the political unification of Italy in the 19th century.

Rome, including Vatican City. The discussion of the monuments of Rome, which for obvious reasons has been removed from its regional context (see below, *Latium*) and placed before the other Italian cities, is presented in a general topographical preface followed by a detailed description of each period. Following this is a description of Vatican City, which, although geographically a part of Rome, has preserved since the Middle Ages a certain individuality and has been since 1929 an independent territory under the sovereign rule of the pope.

a. General topographical character. Rome is situated in the lower valley of the Tiber, on both sides of the river and on the surrounding hills. The city's size, wealth of monuments, and singularly varied urban aspect reflect its complex history.

The ancient city, originally enclosed within the circuit of the Aurelian walls, reflects most intensely the succession and superimposition of the various phases of Rome's history. Within the region of the ancient city on the east bank of the Tiber, the following areas may be distinguished: (1) to the south is the area embracing the Palatine, Aventine, and Caelian hills and the urban zone around the Via Appia; (2) northwest of these is the flat area of the ancient Campus Martius, now distinguished by a dense conglomeration of historic monuments and structures and an urban aspect determined in the period from the Renaissance through the 19th century; (3) to the northeast are the Quirinal, Viminal, and Esquiline hills, with late 19th-century structures for the most part and some isolated historic monuments. On the west bank of the Tiber, the Trastevere area extends to the south. Part of Trastevere was included within the ancient Roman walls, and under Urban VIII it was fortified along the crest of the Janiculum hill. To the north is the area called "the Leonine City," which was fortified by Leo IV and Paul III and includes Vatican City. Since the 19th century Rome has spread in various directions: to the northwest (Prati), to the north and northeast (the Flaminio, Pinciano, Salario, and Nomentano residential areas, with the villas Borghese, Albani, and Torlonia, large suburban villas of the 18th and 19th centuries), and to the east and south (the residential and industrial districts of Tiburtino, Prenestino, Tuscolano, Appio, Ostiense, and Portuense). More recently, urban districts have been built at Monte Mario, Monte Sacro (across the Aniene), and in the E.U.R. area (Esposizione Universale di Roma) and along the road leading to Rome. Within the administrative area of Rome is Ostia, which because of its particular historical importance will be considered separately (see below, *Latium*).

During the Imperial period, ancient Rome was divided into 14 districts, including the district of Trastevere. The nucleus of the modern city has been divided into 22 *rioni* (or "wards," from the word meaning "region"): the traditional *rioni*, established before the 19th-century expansion of the city are: Monti, Trevi, Colonna, Campo Marzio (the ancient Campus Martius), Ponte, Parione, Regola, S. Eustachio, Pigna, Campitelli, S. Angelo, Ripa, Trastevere, and Borgo. Around these wards are 18 others, generally named for the ancient consular roads. Finally, there are the surrounding suburbs, villages, and rural areas.

b. The ancient period. Concerning the foundation of Rome, ancient authors have handed down various legends and dates, but the founding date 754 B.C. or 753 B.C. seems to have become traditional by

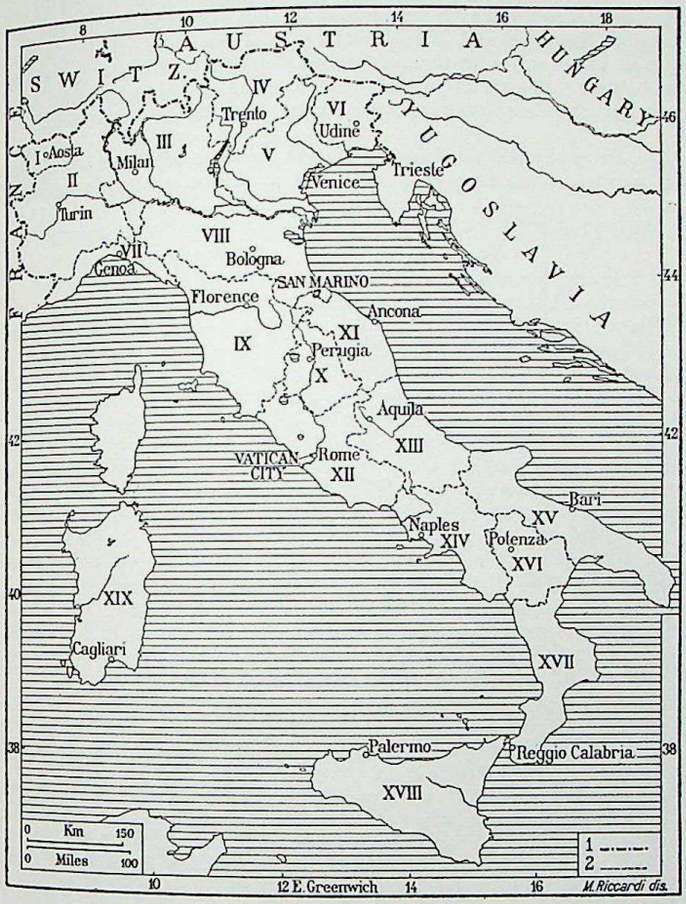
the end of the republican period. Apart from sporadic earlier remains, archaeologists have discovered the existence of settlements and burial areas as early as the 9th–8th century B.C., particularly on the Palatine and in the valley of the Roman Forum. It is likely that the Palatine represents the original nucleus of the city (that which the ancients called *Roma Quadrata*), but it is also possible that the city evolved from the fusion of early villages built on this and other hills, such



Italy, the regions and their capitals. *Key*: (1) Modern national boundaries; (2) regional boundaries. The regions: (I) Aosta Valley; (II) Piedmont; (III) Lombardy; (IV) Trentino-Alto Adige; (V) Veneto; (VI) Friuli-Venezia Giulia; (VII) Liguria; (VIII) Emilia and Romagna; (IX) Tuscany; (X) Umbria; (XI) the Marches; (XII) Latium; (XIII) Abruzzi and Molise; (XIV) Campania; (XV) Apulia; (XVI) Lucania; (XVII) Calabria; (XVIII) Sicily; (XIX) Sardinia.

as the Quirinal and the Esquiline. A particularly advanced stage of urban development was achieved in the 6th century B.C. under the Etruscan dynasty of the Tarquins (the city of the *Quattuor Regiones*). Notable urban and building projects were carried out, including the draining of the valleys, construction of the Forum, and perhaps some fortification. Several temples were constructed, as proved by the discovery of terra-cotta architectural fragments in various parts of the city. Among the temples were that of Jupiter Capitolinus on the Capitoline (509 B.C.), those of Fortuna and the Mater Matuta in the Forum Boarium, and that of Diana on the Aventine. Other temples were built in the early years of the republic: the temples of Saturn, in the Forum (501–493); Ceres, Liber and Libera, on the Aventine (493); and Castor and Pollux, in the Forum (484). In 456 B.C. the Aventine was assigned to the plebs and retained that character until the early centuries of the Empire.

An invasion of the Gauls in 390 B.C. (or 387 B.C.) seems to have inflicted serious damages on the city, but it was hastily rebuilt. The wall traditionally called the "Servian Wall" was begun in 378 B.C. in *opus quadratum* and encompassed the Capitoline, the Quirinal, a large part of the Esquiline, the Caelian, the Aventine, and the Palatine hills. The perimeter of the wall was about 6½ miles. New temples were constructed: to Mars, on the Via Appia (388); Concordia in the Forum (367); Apollo (431 or 353); Juno Moneta on the Capitoline (344); Bellona, in the Campus Martius (soon after 298); Jupiter Victor (295), Victory (294), and Jupiter Stator (294), all on the Palatine; and Aesculapius, on the island in the Tiber; and others. After the middle of the 4th century, urban construction increased. Rostra were constructed for the assemblies at the Comitium and in the Forum (which ceased to serve as a market place and retained only its political character); the Circus Maximus was begun (339), and the first aqueduct, the Aqua Appia, was built under the auspices of the censor Appius Claudius (310). The earliest stone temple in Rome, the so-called "Temple C" in Largo Argentina, dates from the late 4th century. Temple A in Largo Argentina was built in the middle of the 3d century.

The Second Punic War, contact with the Hellenistic world, and Rome's role as a Mediterranean power stimulated new urban and monumental developments; porticoes resembling those of Hellenistic cities, warehouses (e.g. Emporium and Portico of Aemilia, 193), and masonry bridges were constructed (e.g. the Aemilian Bridge, 179). Temple construction began to be influenced by Greek architecture: the two temples of the Forum Holitorium are peripteral; the Temple of Jupiter Stator (after 146) near the Circus Flaminius is peripteral *sine postico*; the Temple of Hercules Victor (perhaps early 2d century) in the Forum Boarium, that of Hercules Musarum (after 187) near the Circus Flaminius, and Temple B in Largo Argentina (which is almost surely the Temple of Fortuna consecrated in 101 by Lutatius Catulus) are pseudoperipteral circular temples. New architectural forms were created, such as the triumphal and honorary arch (the first ones by Stertinius; 196), and the basilica, the first being the Basilica Porcia (184), built by Cato the Elder, and the Basilica Aemilia (179).

The invention of *opus incertum*, which made possible the construction of daring vaults, gave a new impetus to the development of architecture. Sulla constructed the Forum and the Comitium, and during his consulship Lutatius Catulus built the Tabularium (record office) on the Capitoline. The Tabularium served as a kind of scenographic backdrop to the Forum, thus assuming an important role in the urban physiognomy of the area.

With Pompey and Caesar urban development became a political program, and monuments were often erected in carefully planned and regulated urban redevelopment projects. Pompey selected the Campus Martius, an area destined for extensive monumental development, for the construction of an important complex of structures, the Hecatonstylon, with porticoes, a theater (the first of stone masonry in Rome), and the Temple of Venus Victrix. Next to the old Forum, Caesar built a new one, with the Temple of Venus Genetrix.

Augustus effected a great architectural revival. Besides important structures in the Roman Forum, he built a new forum with the Temple of Mars Ultor. Augustus erected a large temple to Apollo on the Palatine near his house, which some authorities identify as the so-called "House of Livia." The Gardens of Maecenas and the Market of Livia were built on the newly reclaimed Esquiline. In the area of the Campus Martius were erected the Pantheon (I, PL. 401), the Septa, the Basilica of Neptune, the Baths of Agrippa, the Amphitheater of Statilius Taurus, the Portico of Philippus, the Theater of Balbus, the Ara Pacis (III, PLS. 385, 488; VII, PL. 211), and the Mausoleum of Augustus; the Theater of Marcellus (I, PL. 394) was completed, and the Temple of Apollo Sosianus and the Portico of Metellus (renamed the "Portico of Octavia") were restored. Particular care was given to the aqueducts, either newly constructed (Aqua Vergine, Aqua Julia) or restored. In comparison with the work of Augustus, that of Tiberius was rather modest: the Temple of Divus Augustus, the Domus Tiberiana (Tiberius' palace) on the Palatine, and the Castra Praetoria. The Claudian and Anio Novus (begun by Caligula) aqueducts were built under Claudius, and the Aventine hill was included within the pomerium. In the first phase of Nero's reign, the Macellum Magnum on the Caelian hill, the Baths of Nero in the Campus Martius, and the Domus Transitoria were constructed. Later, Nero's reign saw two decisive events in the urban development of Rome: the great fire of A.D. 64, which spared only four regions of the city, and the imposition of a city plan prescribing rectilinear housing districts, straight broad streets, and porticoes in front of houses; the plan was not carried out, however, until the time of the Flavians. An extraordinary undertaking was the immense Domus Aurea (Golden House of Nero; VII, PL. 215), which with its park extended over Mt. Oppius, the Caelian, and the Palatine. Vespasian built the Flavian Amphitheater (the Colosseum, inaugurated by Titus in A.D. 80) on the site of a lake that had been part of the gardens of the Domus Aurea. He enlarged the pomerium of Rome, built the Forum Pacis and reconstructed the Capitol (destroyed in A.D. 69). During the reign of Titus there was a great fire (A.D. 80), which destroyed many structures in the Campus Martius and again destroyed the Capitol. Domitian rebuilt the Capitol and in the Campus Martius erected the Divorum, a stadium, and an odeum; he also began a new forum (later dedicated by Nerva) and redesigned the Palatine, which was almost entirely occupied by the imperial palace. Trajan, whose architect was Apollodoros of Damascus (q.v.), left two great works: the Baths of Trajan on the Esquiline and Trajan's Forum. Building activity under Hadrian was intense.

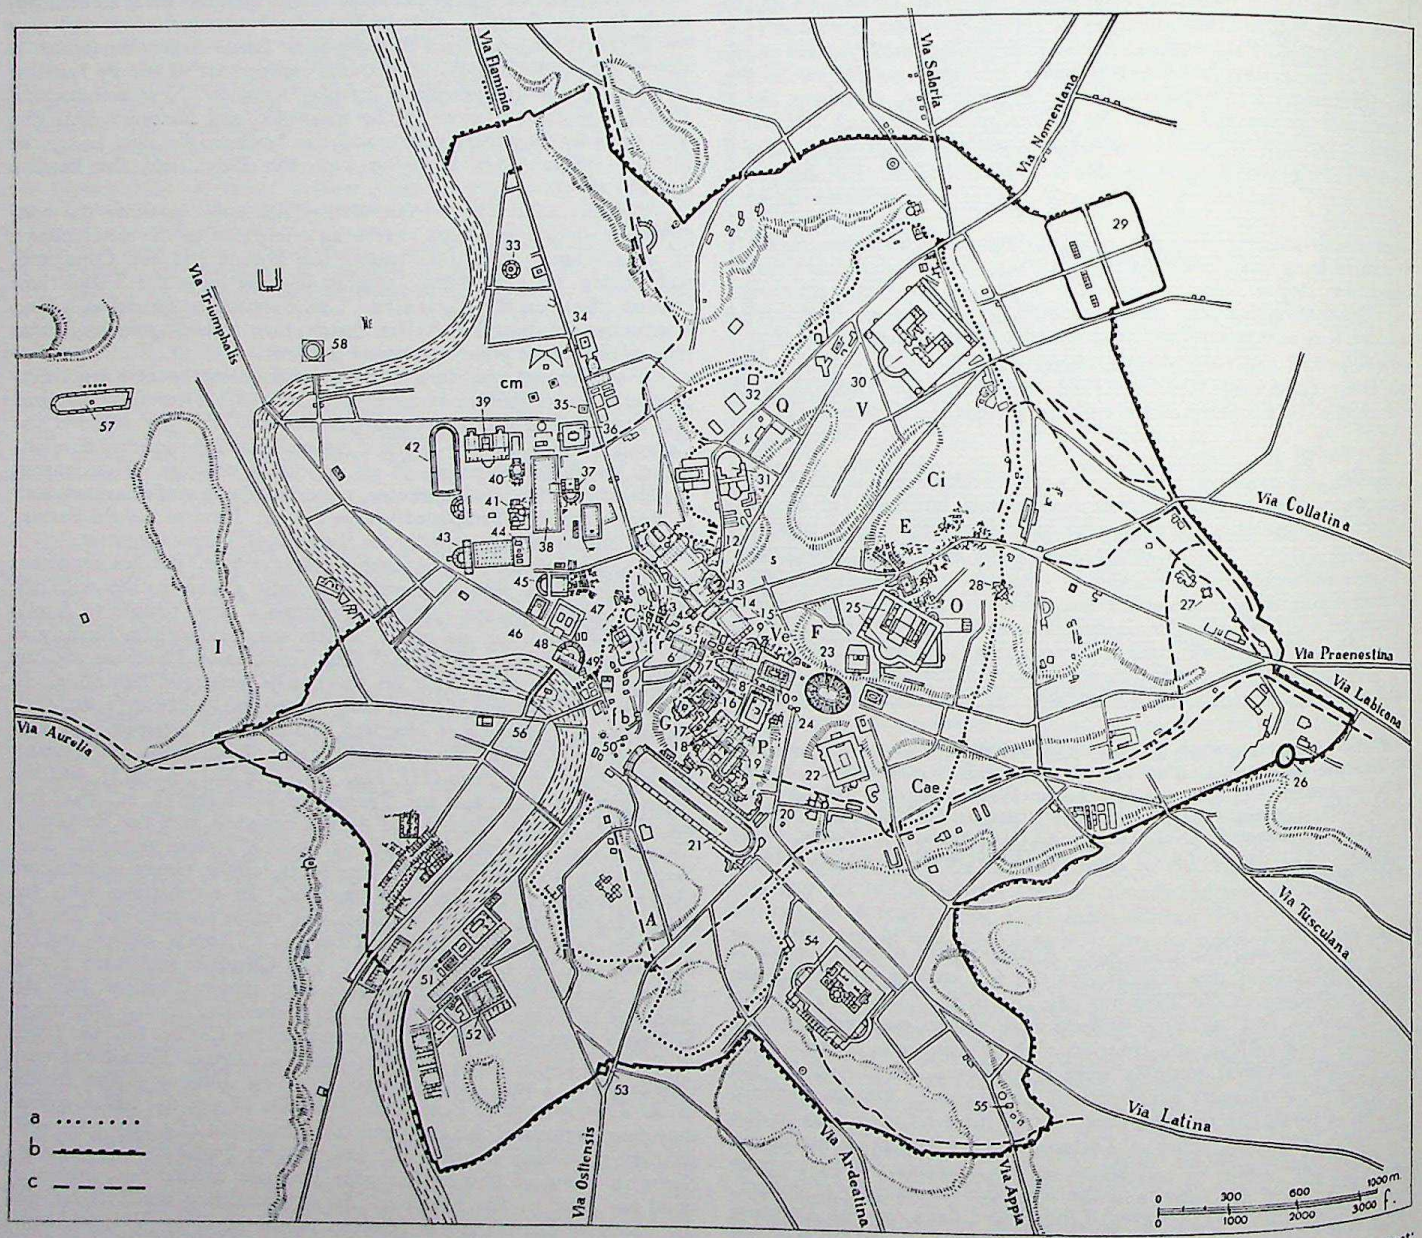
Among his most important works of reconstruction was that of the Pantheon; new constructions included the Temple of Venus and Roma (designed by Hadrian himself) and Hadrian's Mausoleum (now Castel S. Angelo). In the Roman Forum, Antoninus Pius built the Temple of Antoninus and Faustina and in the Campus Martius the Temple of Divus Hadrian, not far from which were erected the Column of Antoninus Pius and the Column of Marcus Aurelius. The serious damages resulting from the fire of A.D. 191 were repaired by Septimius Severus, who also enlarged the imperial palace and built the Septizonium. Near the beginning of the Appian Way Caracalla built a new thermal complex, the Baths of Caracalla (I, PL. 384).

Architectural activity diminished in the 3d century. Aurelian built a large temple to the sun in the Campus Martius and, against the new dangers of invasion, a massive city wall 10 miles long. Diocletian reconstructed the Curia and the other buildings that had been burned under Carinus in 283 and built the Baths of Diocletian. Maxentius rebuilt the Temple of Venus and Roma and began the Basilica of Maxentius (Basilica of Constantine). Constantine was also responsible for the Baths of Constantine on the Quirinal and the Arch of Constantine, not to mention several Christian basilicas. The buildings of Constantine were the last important works of antiquity in Rome, for the difficult political situation of the city and the transfer of the capital of the Empire put an end to building activity. The chief concern was the maintenance of existing structures. The invasions of 410 and 455 were hard blows (notwithstanding the restorations of Honorius and Theodoric) and, together with the depopulation of the city, led to the continuous deterioration of ancient structures, many of which survived, at least in part, only when they were transformed into churches, sacred buildings, or fortresses.

c. From the Middle Ages to the 16th century. With the transfer of the capital of the Empire from Rome to Byzantium (330), building



Rome, plan of the ancient city. *Key*: (*a*) Servian walls; (*b*) Aurelian walls; (*c*) aqueducts. Hills and principal sites of historical and topographic interest: (*P*) Palatine; (*G*) Germalus; (*Ve*) Velian; (*C*) Capitoline; (*Q*) Quirinal; (*V*) Viminal; (*E*) Esquiline; (*Ci*) Cispian; (*O*) Oppian; (*F*) Fagutal; (*Cae*) Caelian; (*A*) Aventine; (*I*) Janiculum; (*fr*) Forum Romanum; (*fb*) Forum Boarium; (*cm*) Campus Martius; (*s*) Subura. activity in Rome diminished, especially in regard to civil structures, while the closing of the temples and the proscription of pagan cults marked the beginning of the slow decay of the most important monuments of classical antiquity. At the same time the earliest forms of Christian monumental architecture evolved. The Basilica of St. John Lateran (311–14) became the new center of Rome. The baptistery and the episcopal palace were built alongside St. John Lateran. The episcopal palace (destroyed in the 14th century) was the seat of the bishops of Rome until the Avignon exile. In the 4th century, the imposing basilicas of St. Peter's and S. Paolo fuori le Mura, similar in structure to St. John Lateran, were erected outside the Aurelian walls. The various districts of the city, while preserving the character of the Roman period, were enriched with churches (e.g., S. Maria Maggiore, S. Sabina, S. Clemente; PL. 176; III, PL. 477), some of which were adapted from earlier structures (e.g., Sta Croce in Gerusalemme, SS. Cosma e Damiano). Besides the longitudinal plan, which was used for churches of this type, the central plan was employed for funerary monuments and baptisteries and only later for churches (e.g., S. Stefano Rotondo).

Many of the monuments of the 4th and 5th centuries have undergone radical transformations and remodelings through the centuries. Of the three Constantinian basilicas with atrium, nave and four side aisles, and transept, St. John Lateran was completely remodeled in the 17th century (see below); Old St. Peter's (326) was demolished in the 16th century, but remains of the original structure exist below the present church. S. Paolo fuori le Mura (314) burned in 1823 but was reconstructed according to the original plan. There are remains of 5th-century mosaics in the triumphal arch; the apse mosaics are of the Venetian school (13th century); there is an Easter candlestick by Niccolò d'Angelo and Pietro Vassalletto (III, PL. 477) and a ciborium by Arnolfo di Cambio (1285; I, PL. 462). The 4th century saw the construction of several churches: S. Lorenzo, rebuilt in 578 (see below); S. Balbina, adapted from the house of the consul L. Fabius Cilo (restored 1930); S. Pudenziana, totally altered in its structure but preserving the original 5th-century apse mosaic (restored; III, PL. 305); and S. Marco. The major central-plan structure of the 4th century is the Mausoleum of S. Costanza with an annular vault decorated with mosaics, paired columns supporting the dome, and 5th-century mosaics in the ambulatory apses. Notwithstanding the Visigothic (410) and Vandal (455) devastations, church construction continued: S. Maria Maggiore, completely rebuilt (432–40) on the site of the preceding Constantinian edifice, preserves the original structure of nave and two side aisles without a transept, the contemporaneous nave and triumphal-arch mosaics, and 13th-century apse and mosaics by Torriti (X, PL. 188); façade mosaics by Filippo Rusuti (13th century; for remodelings, 16th–18th cent., see below). SS. Cosma e Damiano (527), rebuilt from the Bibliotheca Pacis, retains the original apse mosaic (III, PL. 305; X, PL. 178). The Baptistery of St. John Lateran is an octagonal structure preceded by an apsed pronaos with 5th-century mosaics; two orders of columns, one above the other, support the ambulatory roof and drum of the dome; chapels (461–68) dedicated to John the Baptist and John the Evangelist as well as the 7th-century Oratory of S. Venanzio, with original mosaics, surround the octagon. S. Sabina (5th. cent.; restored in 1936–38) consists of nave and two side aisles with ancient columns and Corinthian capitals supporting semicircular arches; the church has preserved the original wooden door with carved panels and the mosaic decoration of the inner façade, while the *schola cantorum* has been reconstructed with marble panels of the 7th–11th century; the apse contains 16th-century frescoes by the Zuccaris (who also frescoed the Chapel of S. Giacinto). The Cappella d'Elci was added in the 17th century, and the adjacent monastery is of the 13th century. In the 6th century a central plan was used for S. Stefano Rotondo, which has a double circular ambulatory of ancient columns supporting architraves (16th-cent. frescoes by N. Circignani and A. Tempesti). S. Maria Antiqua was built in part of a structure of Domitian on the Palatine (II, PL. 445).

Rome so declined (partly because of malaria and plague) that building activity was reduced to sporadic undertakings. The steps Theodoric had taken to preserve the ancient monuments proved futile, for the Byzantine-Ostrogothic wars devastated the city and put an end to the last vestiges of ancient Roman civil organization. The Church took the place of the Empire, and new constructions were sponsored by the popes. S. Agnese, dating from the 7th century (restored many times), was built with narthex, galleries, capitals with impost blocks, and apse mosaics showing Byzantine influence. S. Giorgio in Velabro, perhaps 7th century, is preceded by a portico and has a nave with two side aisles, ancient columns, a ciborium by the Cosmati, and apse frescoes attributed to P. Cavallini (restored). S. Maria in Cosmedin was enlarged in the 8th century with apses at the heads of the aisles (perhaps the first such design in Rome), a crypt (III, PL. 49), a mosaic, iconostasis, ciborium (III, PL. 479), *schola cantorum*, and Cosmati pavement. The Constantinian Basilica of S. Lorenzo fuori le Mura (330) and the Church of the Vergine (8th cent.) were joined to make a single structure, to which was added in the 12th century the campanile and in 1220 the portico of the Vassallettos (13th-cent. frescoes); the episcopal furnishings and Cosmati episcopal throne (III, PL. 483) are of the 12th–13th century, and the adjacent cloister is of the 12th century. In 705–07 Pope John VII restored and decorated with frescoes S. Maria Antiqua; in 757–67 Pope Paul I also embellished the church. The frescoes represent the most interesting examples of early medieval painting in Rome (II, PL. 445).

With the restoration of the Empire and the crowning of Charlemagne (800) Rome partly regained its position as capital. There was some increase in building activity, limited for the most part to the restoration of ancient monuments. Paschal I, besides donating valuable treasures to many churches, was responsible for several important restorations, including that of S. Prassede (822), with 9th-century mosaics in the apse (X, PL. 182). The Chapel of S. Zenone (817–24) is completely covered with Byzantinizing mosaics. The Santini tomb is by G. L. Bernini, the Alano tomb by A. Bregno; there are frescoes by G. Cesari (IX, PL. 303) and Federico Zuccari. S. Maria in Domnica (remodeled in 15th cent., restored in 19th cent.; Renaissance portico attributed to Peruzzi) preserves the original apse mosaics. S. Cecilia in Trastevere (817–24; restored several times) has its original plan of nave and two aisles, an apse mosaic, a ciborium by Arnolfo di Cambio (I, PL. 461), the Forteguerri monument by Mino da Fiesole, and a sculpture of St. Cecilia by S. Maderno. In the convent are frescoes by Cavallini (III, PLS. 107, 109); the cloister is Romanesque. Between 822 and 844 Pope Gregory VII reconstructed S. Marco; transformed through the centuries, it has preserved a 9th-century apse mosaic. There are works of Palma Giovane and C. Maratti, the Pesaro tomb by A. Canova, and a statue of St. Mark the Evangelist by Melozzo da Forlì. In the sacristy is a tabernacle by Mino da Fiesole; a porch and loggia were added to the façade in the 15th century. Pope Gregory VII also restored SS. Nereo e Achilleo, but a major redecoration completed in 1597 (including frescoes by N. Circignani) changed all but the plan of nave and two side aisles and the triumphal arch mosaic. S. Teodoro, also restored by Gregory VII, was rebuilt in the 18th century with a semicircular atrium by C. Fontana; the church contains the original apse mosaic (perhaps 8th–9th cent.; restored) and works of Bacciccio and F. Zuccari.

With the Saracen raids in the middle of the 9th century, conditions in the city again became difficult. By way of defense, Pope Leo IV erected the fortifying wall (848–52) around the Vatican. The political disorder that followed the end of the Carolingian dynasty, the first contests among the German rulers for the possession of the imperial crown, and the subsequent controversy over investiture made the 10th century a period of enormous decline for Rome, which was to be devastated in 1084 by the Normans. Only toward the end of the 11th century did relative peace and internal reorganization permit the repair of religious buildings and the construction of new ones. The Romanesque style did not achieve in Rome the success it enjoyed in other Italian cities, and Rome maintained the Early Christian tradition of basilican construction. After the Norman destruction, Pope Paschal II rebuilt the Church of the SS. Quattro Coronati (1111; restored, 1914), with a fortifying wall. The broad apse (frescoed by Giovanni da San Giovanni, 1630) survives from the original structure; the cloister is 13th-century, as is the separate structure of the Chapel of S. Silvestro with its contemporaneous frescoes of the Roman school. S. Clemente (PL. 176) was rebuilt on the ruins of the 4th-century basilica (which had been remodeled in the 7th–9th cent.). The earlier structure was later adapted as a lower church (containing 9th–12th-cent. frescoes). The building recalls 4th-century churches in its design of atrium preceded by a small porch and portal; preserved within are an apse mosaic imitating that in the pronaos of the Lateran Baptistery, a 12th-century *schola cantorum* with some 6th-century elements (III, PL. 477), the 15th-century Chapel of S. Caterina with frescoes by Masolino (IX, PL. 378), the Roverella monument by A. Bregno and Giovanni Dalmata, and works by S. Conca, F. Trevisani, B. Luti, P. L. Ghezzi, and G. Chiari. In 1113 S. Crisogono was erected (on a 5th-cent. foundation; remodeled in the 17th cent.) with nave and two side aisles, separated by columns supporting architraves, and a Cosmati pavement; the campanile is contemporaneous, and the Cappella del Sacramento was designed by Bernini. S. Maria in Trastevere (12th cent.) has 12th–13th-century mosaics on the façade, mosaics on the arch and vault of the apse (ca. 1140; PL. 177), and a mosaic band by P. Cavallini (III, PLS. 105, 106, 110); the nave and two side aisles are separated by ancient columns. SS. Giovanni e Paolo, built on the remains of the saints' house (of which survive some rooms with mural decorations), has its original atrium, portal, and campanile. The apse frescoes are by N. Circignani (late 17th cent.). The interior, with nave and two aisles, was completely rebuilt in the 18th century.

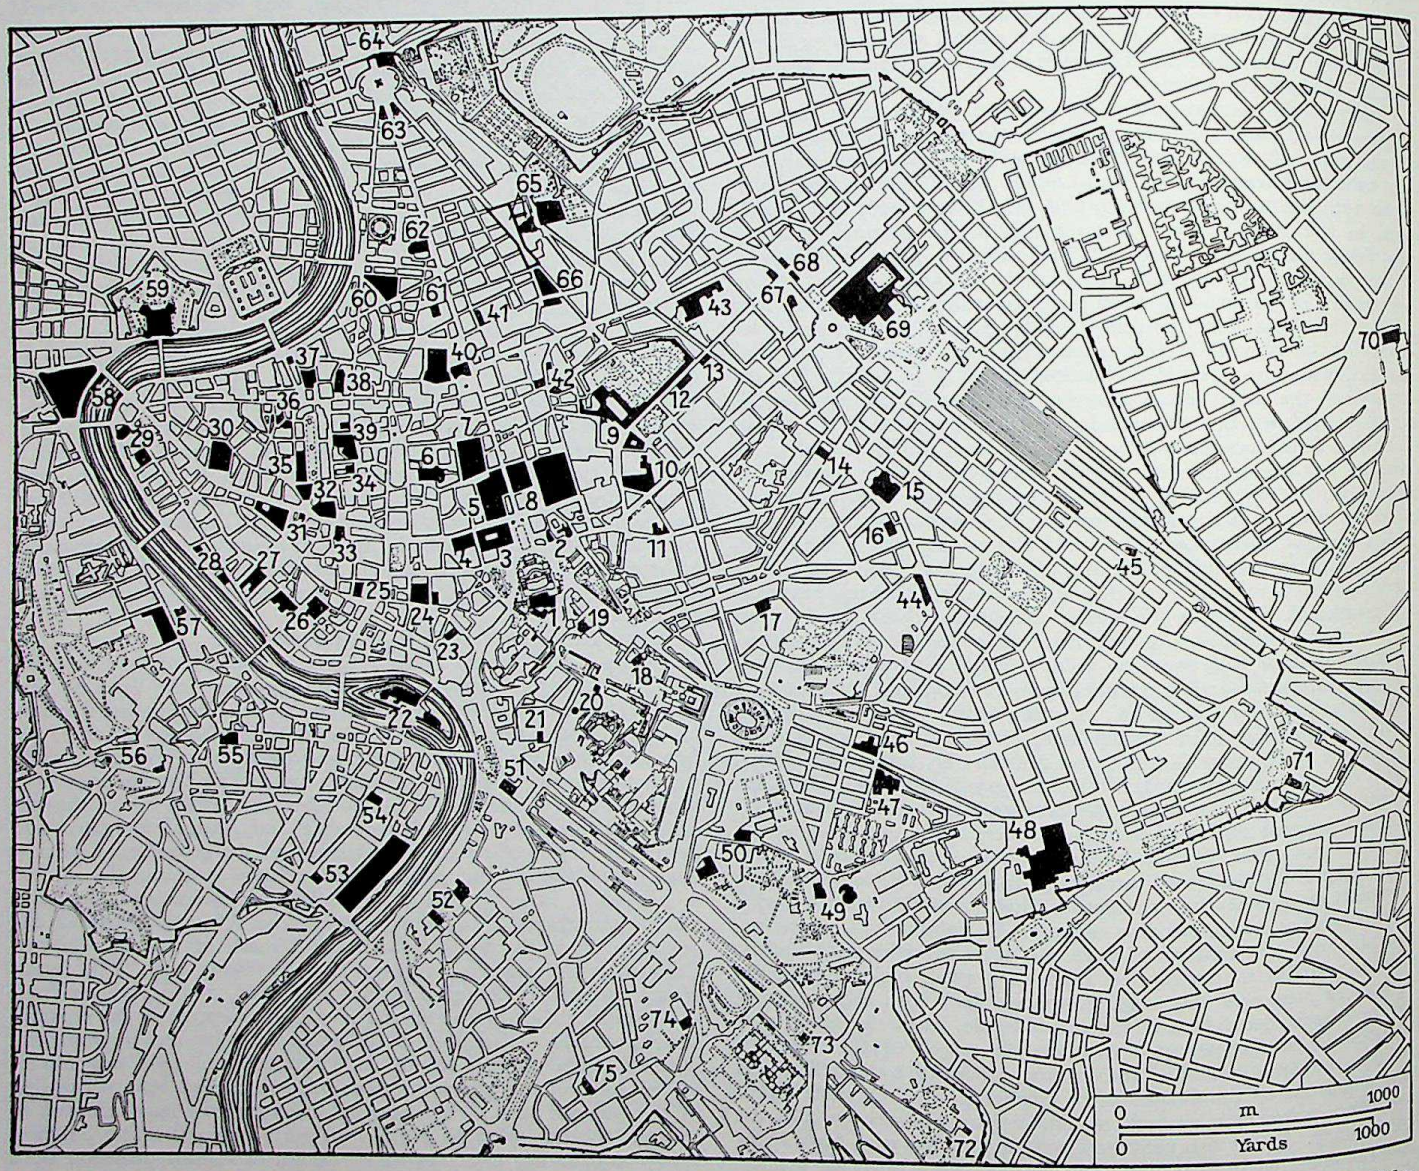
UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

During the 12th and 13th centuries the Cosmati (q.v.) were active in Rome. They were responsible for much of the liturgical furnishings of medieval Roman churches (e.g., S. Cesareo, III, PL. 482; S. Balbina; S. Saba). They were likewise responsible for the construction of the cloisters of St. John Lateran (13th cent.) and S. Paolo fuori le Mura (III, PL. 480) and the portico of S. Lorenzo fuori le Mura. In S. Maria in Aracoeli (nave and two aisles; rebuilt in 1250; remodeled several times) are fine examples of their work in the two pulpits, the pavement, two tombs in the choir, and the tomb of Cardinal Acquasparta (with frescoes by P. Cavallini).

Campaniles were characteristic Romanesque structures in Rome. Their design was derived from Lombard architecture, but the Roman examples were enlivened with polychrome ceramic panels and inlaid marble. Such campaniles include those of S. Maria Maggiore (which was reconstructed in the 14th cent.), SS. Giovanni e Paolo, Sta Croce in Gerusalemme, S. Francesca Romana, S. Lorenzo fuori le Mura, S. Marco, S. Maria in Cosmedin, S. Giorgio in Velabro, and S. Silvestro in Capite. Important civil edifices of the period include the Milizie, Conti, Colonna, Millina, Grillo, and Capocci towers; the Casa di Cola di Rienzo (or dei Crescenzi), the Palazzetto degli Anguillara (restored), and the Casa dei Mattei; and the monasteries of SS. Quattro Coronati, S. Clemente, and S. Paolo fuori le Mura.

In the 14th century, when the popes were in Avignon, there was little new construction in Rome. A part of the Church of S. Maria in Aracoeli, with its impressive stairway, belongs to this period. Within the church is the Bufalini Chapel by Pinturicchio and the tomb slab of G. Crivelli by Donatello. The Gothic Church of S. Maria sopra Minerva has a nave and two aisles (completed 15th cent.).



Rome, plan of the center with principal monuments. (1) Piazza del Campidoglio, Capitoline Museums, and S. Maria in Aracoeli; (2) S. Maria di Loreto and SS. Nome di Maria; (3) Palazzo Venezia and S. Marco; (4) the Gesù; (5) Palazzo Doria Pamphili and S. Maria in Via Lata; (6) S. Maria sopra Minerva; (7) Collegio Romano and S. Ignazio; (8) Piazza SS. Apostoli and Odescalchi, Salviati, and Colonna palaces; (9) Quirinal and Consulta palaces; (10) Palazzo Pallavicini-Rospigliosi; (11) Villa Aldobrandini; (12) S. Andrea al Quirinale; (13) S. Carlo alle Quattro Fontane; (14) S. Pudenziana; (15) S. Maria Maggiore; (16) S. Prassede; (17) S. Pietro in Vincoli; (18) SS. Cosma e Damiano; (19) SS. Luca e Martina; (20) S. Maria Antiqua and S. Within the church (restored 19th cent.) is the Cappella dell'Annunziata by C. Maderno, with a panel by Antoniazzo Romano; the Carafa Chapel, with frescoes by Filippino Lippi; an adjacent room, decorated by Raffaellino del Garbo; works by M. Venusti; the statue of Christ carrying the Cross by Michelangelo; the Tornabuoni tomb by Mino da Fiesole; sculptures by C. Mariani, E. Ferrata, Raffaelle da Montelupo, N. Cordier; the Chapel of S. Domenico, after designs by C. Marchionni; and the Raggi monument by Bernini.

In the 15th century Rome's medieval aspect was not substantially modified. Most building activity was concerned with the restoration and repair of monuments, although some new structures were erected. The Palazzo Venezia, begun in 1452, is medieval in character, while the unfinished inner portico is fully Renaissance, in fact Albertian, in style. The small adjacent palace, erected in the same period, was dismantled in 1911 and rebuilt farther back to make room for the monument to Victor Emmanuel II. Under Pope Sixtus IV there was an initial effort to solve problems of city planning (e.g., confluence at Ponte S. Angelo of the roads delimiting the so-called "Curial City"; construction of Ponte Sisto connecting the wards of Regola and Trastevere). Among the churches that were built or reconstructed in this period is S. Maria del Popolo, a medieval structure rebuilt toward the end of the 15th century (PL. 205); basilican interior with nave and two aisles, altered by Bernini, and with sculptures by A. Bregno, frescoes by Pinturicchio (Della Rovere Chapel, 1485–89); apse and choir by Bramante (II, PL. 344), funerary monuments by A. Sansovino (IV, PL. 455), A. Bregno, Mino da Fiesole; stained glass by G. de Marcillat; Cerasi Chapel, with paintings by A. Carracci and Caravaggio (*Conversion of St. Paul*; III, PL. 34; *Martyrdom of St. Peter*); Chigi Chapel, designed by Raphael (mosaics after his cartoons; X, PL. 192), with statues by Lorenzetto and Bernini (I, PL. 381), altarpiece by Sebastiano del Piombo; Cybo Chapel by C. Fontana with altar painting by C. Maratti. S. Agostino (attributed to B. Pontelli or J. da Pietrasanta) has a nave and two aisles. There is a Madonna del Parto by J. Sansovino, a fresco of Isaiah by Raphael, and a Madonna dei Pellegrini by Caravaggio. The main altar is by Bernini, and there are works by Guercino and Lanfranco. Of the 15th-century structure of S. Giovanni Battista dei Genovesi only the cloister survives, attributed to B. Pontelli. S. Pietro in Montorio, with nave and side chapels, contains works by Sebastiano del Piombo, G. Vasari, N. Circignani, Daniele da Volterra, D. van Baburen, and Bernini and pupils. S. Maria della Pace (see below) has been renovated several times. S. Pietro in Vincoli was refurbished by Meo del Caprina, with façade preceded by a portico (as in the Church of SS. Apostoli; see below); interior (altered in 18th cent.), with nave and two aisles; the broad nave is adorned with columns taken from earlier buildings; tomb of Julius II, designed by Michelangelo, with the *Moses*. Secular structures include the Palazzo della Cancelleria (ca. 1485), perhaps by A. Bregno. To Bramante are ascribed the courtyard and the adjacent Church of S. Lorenzo in Damaso. The Palazzo del Governo Vecchio, the Palazzo dei Penitenzieri (1481), and the courtyards of the Cesi and Cesarini-Sforza palaces also date from this period, as do the Casa del Burcardo and the Hospital of Sto Spirito, with façade attributed to Rossellino (restored), flanking sections by B. Pontelli (much altered), and portal by A. Bregno.

d. The modern period. In the early 16th century, with the building of the new St. Peter's (see below, *Vatican City*), papal patronage, and the presence of several great artists, including Bramante (q.v.), the new Renaissance appearance of Rome gradually emerged. Julius II opened new streets (e.g., Via Giulia, Via della Lungaretta) flanked by palaces of the nobility. Bramante, who directed the work at St. Peter's, also built the Tempietto in the courtyard of S. Pietro in Montorio (I, PL. 305) and the courtyard of S. Maria della Pace; he began the Vatican buildings (Cortile di S. Damaso and design for the Belvedere; II, PLS. 345, 346) and the Palazzo dei Tribunali (never completed) in Via Giulia. Other structures built on Via Giulia at this time include the Palazzo Sacchetti (room frescoed by F. Salviati), Palazzo Falconieri (loggia toward the Tiber added in the 17th cent. by Borromini), the rear portion of Palazzo Farnese (loggia by G. della Porta), built by A. da Sangallo the Younger and completed by Michelangelo (gallery frescoed by Annibale Carracci and assistants; I, PL. 381; II, PL. 194; III, PL. 86).

S. Giovanni dei Fiorentini is by J. Sansovino, A. da Sangallo the Younger, and G. della Porta, with façade by A. Galilei (1734) and apse after designs by Michelangelo. S. Eligio degli Orefici, by Raphael, is of rectangular plan and has been much altered. S. Maria di Loreto is by A. da Sangallo the Younger, 1507–15, and G. del Duca, 1582. Sto Spirito in Sassia (A. da Sangallo the Younger, 1540) has a façade by O. Mascherino. S. Giuseppe dei Falegnami (G. della Porta, 1538) was built on the ruins of the Mamertine Prison. Between Via Giulia and the present Corso Vittorio Emanuele arose the Piccola Farnesina (now the Museo Barracco), attributed to A. da Sangallo the Younger. The Palazzo Spada (1540) was decorated by G. Mazzoni, who may also have been the architect (courtyard; IX, PL. 311, and perspective gallery by Borromini). The Palazzo Vidon (formerly Caffarelli) has a 19th-century façade; the rear portion is after Raphael's design. The Palazzo Massimo alle Colonne has a curved façade (B. Peruzzi; XI, PL. 121). The Palazzo Altemps was begun by B. Peruzzi and completed by M. Longhi the Elder. The Palazzo Alberini was designed by G. Romano. The Palazzo Salviati on Via della Lungara is by Nanni di Baccio Bigio.

In addition to his work on the new construction of St. Peter's, Michelangelo (q.v.) undertook urban planning schemes, including the arrangement of the Piazza del Campidoglio. Michelangelo also built the Porta Pia (partly rebuilt in the 19th cent.) and adapted part of the Baths of Diocletian as the Basilica of S. Maria degli Angeli (1563–66; altered by Vanvitelli). In the area of Via Flaminia and on the opposite side of the Tiber arose the first of the Roman villas. The Farnesina was built for Agostino Chigi (1508–11, by B. Peruzzi; XI, PLS. 119, 120; gallery with frescoes by G. Romano and Giovanni da Udine after cartoons by Raphael, who painted the famous *Galatea*; III, PL. 392; X, PL. 250; Salone delle Prospettive by B. Peruzzi; XI, PL. 118; *Marriage of Alexander and Roxana* by Sodoma; fresco by Sebastiano del Piombo). The Villa Madama was built after designs by Raphael (continued by A. da Sangallo the Younger, unfinished; stuccoes by Giovanni da Udine and frescoes by Giulio Romano; PL. 206). Also of this period is the Villa of Julius III, or Villa Giulia (1551–53; by B. Ammanati and Vignola, court redone by Vasari), together with a country house built by Vignola for the pope, and S. Andrea in Via Flaminia (I, PL. 305), by the same architect. The Palazzina of Pius IV (IX, PL. 313) and the Casino of Pius IV (see below, *Vatican City*) are by P. Ligorio (1558). The Villa Medici on the Pincio is by A. Lippi (IX, PL. 312). Among Renaissance structures are the Ruspoli, Caetani, and Firenze palaces and the Collegio Romano, all by B. Ammanati; Palazzo della Sapienza (now Archivio di Stato; G. della Porta); Palazzo Sciarra (F. Ponzio); Palazzo del Quirinale (PL. 207; F. Ponzio, O. Mascherino, D. Fontana, altered by Bernini; the long wing by F. Fuga); Palazzo Chigi (G. della Porta; completed by C. Maderno and F. della Greca; *salone* by R. Stern); Palazzo Borghese (PL. 207; M. Longhi the Elder; nymphaeum by C. Rainaldi).

Religious structures: S. Giovanni Decollato (frescoes and oil paintings by N. Circignani, F. Salviati, J. del Conte, G. Vasari). The Gesù (1568, by Vignola) was the archetype of countless churches built during the Counter Reformation; single aisle with side chapels; dome over the crossing of the arms of the Latin-cross plan (frescoed ceiling by Bacciccio; altar of St. Ignatius by A. Pozzo). S. Maria in Vallicella, or Chiesa Nuova, was built after a design by M. Longhi the Elder (with façade by F. Rughesi; nave and side aisles; frescoes by P. da Cortona and works of Rubens, C. Ferri, C. Rainaldi, Cosimo Fancelli, and G. Muziano). S. Luigi dei Francesi has a façade by G. della Porta (1589; Contarelli Chapel decorated by G. Cesari, with paintings by Caravaggio; frescoes by Domenichino). S. Caterina dei Funari has a façade by G. Guidetti (1564) and work by Annibale Carracci, F. Zuccari, G. Muziano, and S. Pulzone. S. Paolo alle Tre Fontane was built in the 5th century, rebuilt in the Gothic period, and remodeled by G. della Porta. S. Maria dell'Orto may have been built after a design by G. Romano (façade variously attributed: Vignola, M. Longhi the Younger). S. Nicola in Carcere was built by G. della Porta on an earlier structure. Numerous fountains were erected at this time, including the Fontana delle Tartarughe (PL. 206) and the fountain in Piazza Campitelli.

At the end of the 16th century, Sixtus V resumed the work of urban planning. Domenico Fontana created a vast plan for streets to connect the basilicas and principal monuments visited by religious pilgrims, with an eye to emphasizing perspective views of the monuments (streets joining St. John Lateran, S. Maria Maggiore, and Trinità dei Monti). The ideal center of this scheme was the Basilica of S. Maria Maggiore. Squares were adorned with obelisks and fountains (e.g., the squares in front of St. Peter's and St. John Lateran; X, PL. 151). The first monumental fountains at the ends of aqueducts appeared (e.g., Acqua Felice, D. Fontana, 1585–87). Churches took on monumental proportions, and palaces repeated Renaissance forms, which were amplified in an early baroque manner (e.g., Lateran Palace, by D. Fontana; Monte di Pietà, etc.). Churches erected in this period were S. Susanna (1603; C. Maderno), with frescoes by B. Croce; S. Maria della Vittoria (1605; C. Maderno), with façade by G. B. Soria [Cornaro Chapel with Bernini's *Ecstasy of St. Theresa* (II, PL. 273), and Guercino's *Trinity*]; S. Sebastiano, by F. Ponzio and G. Vasanzio (J. van Santen); S. Gregorio Magno (G. B. Soria), and the nearby chapels of S. Andrea, S. Silvia, and S. Barbara, with frescoes by Domenichino, G. Reni, and A. Viviani. S. Andrea della Valle was begun by P. P. Olivieri (1591) and completed by C. Maderno (1650), with façade by C. Rainaldi (1663). The interior has a Latin-cross plan, dome frescoes by G. Lanfranco, pendentives and conch of the apse by Domenichino, apse by M.

Preti; works of A. Raggi. S. Maria dei Miracoli and S. Maria di Montesanto, in Piazza del Popolo, both circular with dome and columned pronaos, are by C. Rainaldi. S. Maria in Campitelli (C. Rainaldi; I, PL. 405) has works of L. Giordano, Bacciccio, and S. Conca. Bernini (see below, *Vatican City*), was responsible for the colonnade of St. Peter's Square (I, PL. 403); S. Bibiana, reconstruction of an Early Christian building (1625; within, statue of St. Bibiana by Bernini; II, PL. 272; frescoes by P. da Cortona); S. Andrea al Quirinale, of elliptical plan; the layout of Piazza Navona with the Fountain of the Four Rivers and the Fontana del Moro (I, PL. 402); the planning of the internal façade of the Porta del Popolo (1655; the outer façade had been rebuilt earlier by Vignola). Borromini (q.v.) created the façade of S. Agnese in Agone (II, PL. 306; central-plan interior begun by Rainaldi; sculptures by E. Ferrata, D. Guidi, A. Raggi, M. Caffà; frescoes by Bacciccio and C. Ferri); S. Carlo (Carlino) alle Quattro Fontane (1640), with an elliptical plan (I, PL. 420; II, PLS. 303–05, 308); S. Ivo alla Sapienza (1660), on a star plan with dome and spiral lantern (I, PL. 420; II, PLS. 301, 302, 312); S. Andrea delle Fratte (1656; crossing tower and campanile; single aisle, several times altered, with statues by Bernini; façade by G. Valadier); the Oratorio dei Filippini (1637–62; II, PL. 307); S. Giovanni in Oleo; the Palazzo di Propaganda Fide (II, PLS. 308, 311); S. Maria dei Sette Dolori (II, PL. 309); and S. Maria delle Fornaci. Borromini also did the interior remodeling of St. John Lateran (II, PLS. 309, 310), with nave and four aisles, piers along the nave enclosing the columns of the earlier church, and niches with statues [apse mosaic, 19th-century restoration of the original by J. Torriti; monument of Cardinal Annibaldi by Arnolfo di Cambio; fragment of Giotto's fresco of Boniface VIII; Corsini Chapel by A. Galilei, who also built the façade (1736)]. Also noteworthy was the activity of Pietro da Cortona (q.v.): S. Maria in Via Lata (1660), with remains of an earlier building and 8th-century frescoes; SS. Luca e Martina (1640; I, PL. 419), erected on the site of the 8th-century Church of S. Martina; the baroque façade of the 15th-century S. Maria della Pace, with columned, semicircular pronaos (I, PLS. 381, 419), and octagonal interior surmounted by a dome and preceded by a nave [frescoes by Raphael (Sibyls) and B. Peruzzi (Ponzetti Chapel; XI, PL. 119); paintings by O. Gentileschi, B. Peruzzi, F. Albani; works of C. Fancelli; main altar by C. Maderno, with sculptures by S. Maderno]. Other 17th-century buildings: S. Carlo al Corso (dome attributed to P. da Cortona; modified project of O. and M. Longhi the Younger). SS. Vincenzo e Anastasio (1630; M. Longhi the Younger). S. Ignazio, a Jesuit church, with façade by A. Algardi; interior design by O. Grassi, with ceiling frescoes by A. Pozzo (*Triumph of St. Ignatius*; II, PL. 172), who also created the immense canvas simulating a dome and designed the altars of the transept. S. Marcello, with façade by C. Fontana (PL. 223) and reliefs by A. Raggi; single-aisle interior designed by J. Sansovino; with frescoes by Perino del Vaga and assistants. S. Francesca Romana (S. Maria Nova), with façade by C. Lombardi (1615), built on an earlier building of which there remains the apse mosaic (12th cent.) and the campanile. S. Isidoro, by C. Bizzaccheri (1620), with works by C. Maratti, A. Sacchi, and others. Church of Gesù e Maria by C. Maderno, with single aisle covered by a barrel vault, the Bolognetti sepulchral monuments by F. Aprile, F. Cavallini, M. Maille (Maglia); façade by G. Rainaldi. S. Francesco a Ripa, with façade by M. de' Rossi; Altieri Chapel with statue of the Blessed Lodovica Albertoni by G. L. Bernini (II, PL. 279). S. Maria in Via (first built in 10th cent., several times rebuilt); plan by G. della Porta; façade by M. Longhi the Elder and C. Rainaldi (1595–1670). S. Martino ai Monti, retaining the original basilican structure; rebuilt after designs probably by Pietro da Cortona, façade of 1676, frescoes by G. Dughet (G. Poussin). S. Carlo ai Catinari, by R. Rosati (1611), façade by G. B. Soria; Greek-cross plan interior, altered in the 19th century. S. Caterina da Siena, with façade by G. B. Soria (1630). SS. Domenico e Sisto, by Vincenzo della Greca.

Secular architecture exhibited decorative and scenographic effects; squares were adorned with fountains and obelisks. In addition to the fountains in Piazza Navona, Bernini (q.v.) was responsible for the Triton Fountain (Piazza Barberini) and the two Fountains of the Bees (Vatican; Piazza Barberini). Also of this period is the monumental fountain of the Acqua Paola by F. Ponzio (PL. 207) and that of Ponte Sisto. Numerous palaces were built: Palazzo Barberini (II, PL. 134), begun by C. Maderno in 1625 with the collaboration of Borromini and completed by Bernini, with later additions. Palazzo Pamphili in Piazza Navona (G. Rainaldi, 1650, with frescoes by P. da Cortona). Palazzo di Montecitorio (II, PLS. 269, 271), on designs by Bernini, completed by C. Fontana, now the seat of the Chamber of Deputies. Palazzo Misciattelli, by G. A. dei Rossi (1660). Palazzo Carpegna, built in the 16th century but enlarged in the 17th century, now the seat of the Accademia di S. Luca. Palazzo Verospi (C. Rainaldi, considerably altered, with a frescoed loggia by F. Albani). Palazzo Altieri (G. A. dei Rossi; frescoes by C. Maratti). Palazzo Salviati on the Corso (C. Rainaldi, 1662). Palazzo Pallavicini-Rospigliosi, by G. Vasanzio (J. van Santen; 1603), enlarged by C. Maderno; Casino with fresco of Aurora by G. Reni (PL. 218). Villa Borghese (PL. 445), with Casino by Vasanzio. Villa Ludovisi (Casino dell'Aurora frescoed by Guercino; II, PL. 197). Villa Doria Pamphili (Casino by A. Algardi, after 1650).

In the 18th century, the baroque scenographic style persisted until the establishment of neoclassicism. The Spanish Steps of the Trinità dei Monti (A. Specchi, F. De Sanctis, 1725), with the layout of Piazza di Spagna (Palazzo di Spagna, A. Specchi). Trevi Fountain (II, PL. 137; N. Salvi; reworking of an earlier project by Bernini). Architectural setting of Piazza S. Ignazio, by Raguzzini (the architect of the Hospital and Church of S. Gallicano). Layout of the Porta di Ripetta (destroyed). Monumental undertakings of the 18th century included the façade of S. Maria Maggiore (F. Fuga, 1743) and of St. John Lateran (A. Galilei, 1736). Façade of Sta Croce in Gerusalemme (II, PL. 138; D. Gregorini), with baroque interior by P. Passalacqua; apse fresco attributed to Antoniazzo Romano; works of C. Giaquinto, C. Maratti, Quinones tomb by J. Sansovino. SS. Apostoli, with 15th-century portico (upper part modified by C. Fontana in 1702), façade by G. Valadier (1827); nave and two aisles, baroque interior with ceiling fresco by Bacciccio, monument to Clement XIV by Canova. S. Maria dell'Orazione e Morte, with façade by F. Fuga, works of G. Lanfranco, C. Ferri, P. L. Ghezzi. SS. Nome di Maria (A. Deriset; 1738). S. Maria in Monticelli (M. Sassi; 1715). S. Maria in Aquiro, with façade completed by P. Camporese the Elder (1744–45), interior by Francesco da Volterra (1590; restored), works of C. Mariani, C. Saraceni, G. van Honthorst. Church of S. Maddalena, with façade by G. Sardi (1735), interior several times altered, by C. Fontana, G. A. de' Rossi, C. Quadri; Latin-cross plan with elliptical nave; works by S. Conca, Bacciccio, P. Bracci. S. Filippo Neri (F. Raguzzini). S. Maria della Quercia (F. Raguzzini). SS. Trinità dei Pellegrini (F. De Sanctis, 1723). SS. Marcellino e Pietro (reconstructed by G. Theodoli, 1725). SS. Celso e Giuliano (reconstructed by C. de Dominicis, 1736). SS. Trinità degli Spagnoli, by M. Rodrigues dos Santos and G. Sardi (1741), elliptical interior with frescoes by C. Giaquinto. Palaces: Palazzo della Consulta (F. Fuga, 1737; II, PLS. 138, 139). Palazzo Corsini (F. Fuga; completed after 1751). Palazzo Cenci-Bolognetti (F. Fuga). Palazzo Doria Pamphili; façade on the Corso by G. Valvassori (1734), façade in Via del Plebiscito by P. Amelli (1744), façade in Piazza del Collegio Romano by A. Del Grande (1652–71). Palazzo Simonetti (A. Specchi, 1727). Palazzo Rondanini (now the Banca dell'Agricoltura). Villa Albani (C. Marchionni, PL. 442, 445; X, PL. 211). Late 18th-century palaces include Palazzo Braschi (PL. 226), Palazzo della Stamperia, and the Spinola, Lovatelli, Del Drago, Corsetti, and Colonna palaces (PL. 105).

The revived interest in antiquity, the excavation of the Roman Forum, and the activities of Winckelmann, Mengs, and Piranesi (S. Maria del Priorato, X, PL. 267) created a new taste for spatial clarity. The architect G. Valadier represents this tendency. He was responsible for the new arrangement of Piazza del Popolo (1816–20; II, PL. 134) and of the adjacent Pincio, where he built the Casino Valadier; embankments on the Tiber; the restoration of the Arch of Titus; the façade of S. Pantaleo; S. Rocco. The interior organization of the Casino and Villa Borghese, with the Temples of Diana and Aesculapius, was supervised by A. Asprucci (X, PL. 209). In this period Via Nazionale was opened, the Milvian bridge restored, and the Column of the Immaculate Conception erected (L. Poletti, 1856). Palazzo Wedekind (P. Camporese, 1838), with Ionic pronaos (columns from Veio, anc. Veii). Twin palaces of Piazza del Popolo (G. Valadier). Teatro Argentina (P. Camporese).

In the second half of the 19th century (particularly after 1870, when Rome became the capital of Italy) several unfortunate restorations were undertaken (e.g., S. Paolo fuori le Mura), and new structures were built in the "Umbertino" style (so called for King Humbert I). Rome suffered the loss of whole neighborhoods (e.g., the Aracoeli area), which were destroyed to make room for monuments, squares, and official buildings in the new style (e.g., Piazza dell'Esedra, with buildings by G. Koch, 1885, and the Naiad Fountain, by M. Rutelli, 1901). The embankments of the Tiber were given their final forms. Monument to Victor Emmanuel II (X, PL. 157; by G. Sacconi, with sculpture by A. Zannelli and E. Chiaradia). Palazzo di Giustizia (G. Calderini). Ministero delle Finanze (R. Canevari, 1871); Ministero dell'Agricoltura e Foreste (O. Cavagnari), Ministero della Pubblica Istruzione (C. Bazzani), Ministero di Lavori Pubblici (P. Passerini), Ministero degli Interni (M. Manfredi), Ministero di Grazia e Giustizia (P. Piacentini). Cassa di Risparmio (A. Cipolla), Banca d'Italia (G. Koch). Palazzo delle Esposizioni (P. Piacentini). Galleria Nazionale d'Arte Moderna in Valle Giulia (C. Bazzani). Palazzo Margherita (G. Koch; now U. S. Embassy). Opera House, rebuilt by M. Piacentini, who completed the reconstruction in 1960. In the period between the two world wars new residential sections

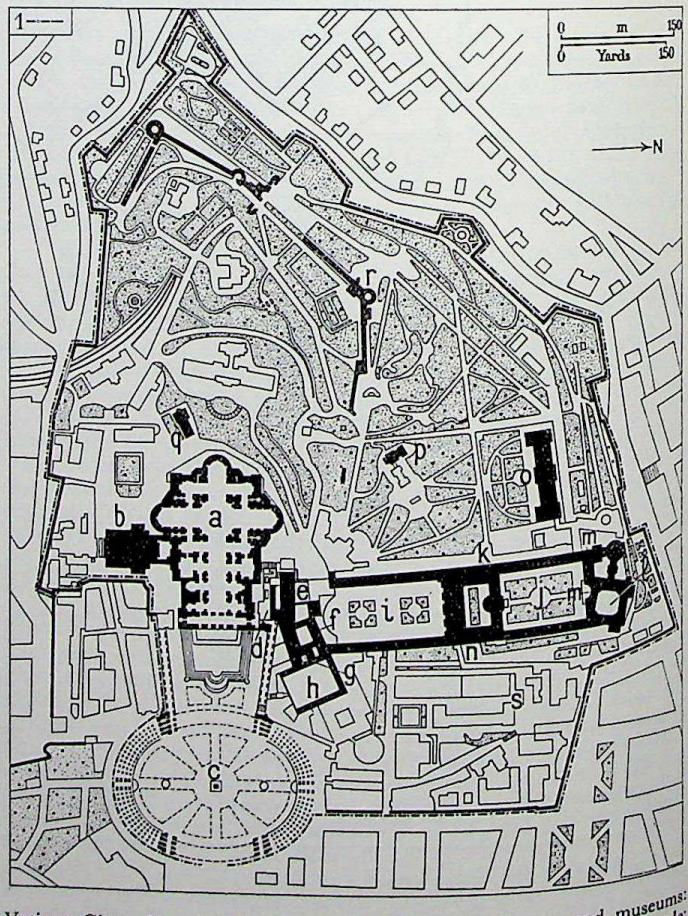
and public structures were erected. The arrangement of the Stazione Termini and surrounding area (F. Mazzoni) was completed in 1952 by E. Montuori, A. Vitellozzi, and others; the striking façade of the station was decorated by A. Tot. Other outstanding 20th-century structures include the Stadio Flaminio (A. and P. L. Nervi) and the Palazzetto dello Sport (P. L. Nervi and A. Vitellozzi; V, PL. 117).

Museums and galleries: Museo Pigorini. Museo di Villa Giulia (Etruscan finds). Museo Nazionale Romano (collection of Greek and Roman sculpture and painting). Museo Barracco (Etruscan, Egyptian, Roman, Greek, and Assyrian sculpture). Capitoline Museum (and Palazzo dei Conservatori; ancient sculpture collections; painting gallery, with works of 15th–17th cent.). Museo della Civiltà Romana (documentary material, models, plans). Galleria Nazionale (in the Barberini and Corsini palaces; Italian and foreign paintings of 14th–18th cent.). Galleria Borghese (works by Bernini, Caravaggio, Titian; ancient sculpture). Galleria Nazionale d'Arte Moderna (large collection of modern art). Galleria Spada (17th-cent. paintings; Roman remains). Museo di Palazzo Venezia (13th–17th cent. paintings; enamels, ceramics, arms and armor, tapestries, small bronzes, 13th–18th cent. Italian sculpture). Museo Nazionale di Castel S. Angelo (including armory and painting gallery). Accademia di S. Luca (Italian and Flemish 16th–17th cent. painting; 17th–19th-cent. sculpture of the Roman school). Galleria Comunale d'Arte Moderna (in Palazzo Braschi; 19th- and 20th-cent. Roman artists). Museo di Roma (in Palazzo Braschi; documents and works related to the topography, history, and life of Rome from the Middle Ages to the present). Museo Nazionale d'Arte Orientale (Iranian, Chinese, Indian, Tibetan, Nepalese, and Siamese art). Calcografia Nazionale (print collection, 17th–20th cent.). Gabinetto Nazionale delle Stampe. Museo Numismatico della Zecca. Collezioni dell'Istituto Italiano di Numismatica. Museo Nazionale delle Arti e Tradizioni Popolari (Italian folk art and crafts). Galleria Colonna (15th–18th-cent. paintings). Galleria Doria Pamphili (14th–18th-cent. paintings; Roman sculpture; bronzes and marbles by Algardi and Bernini). Galleria Pallavicini (15th–18th-cent. paintings). Museo Torlonia (Greek originals, Roman copies, Roman portraits, Etruscan finds). Museo Africano (ethnological collections).

e. Vatican City. Surrounded by a bastioned wall, except for the section bounded by Bernini's colonnade, Vatican City comprises two main areas: one occupied by gardens, the other by St. Peter's Basilica and the palaces. In Roman Imperial times the site was occupied by the Circus of Nero and gardens. From the time of Nero, the area north of the Circus (including the present site of St. Peter's) was a cemetery, which has been partly excavated. Tradition has it that St. Peter is buried there. Constantine the Great erected the first Basilica of St. Peter's (324–49), thereby concealing the tombs, which were for the most part pagan. Old St. Peter's was a five-aisled basilica preceded by a large atrium. The basilica was partially reconstructed in 1452 by Pope Nicholas V, after a design by Bernardo Rossellino (Latin-cross with dome over the crossing). In the early 16th century, under Julius II, the western end was demolished by Bramante (q.v.), who was commissioned to build the new basilica. New St. Peter's was begun in 1506, with a Greek-cross plan and a dome modeled after that of the Pantheon. With the death of the pope (1513) and the architect (1514), construction was interrupted at the piers of the crossing. The work was resumed later and successively modified by some of the greatest artists of the age. Bramante was succeeded by Raphael (q.v.), who, together with Fra Giovanni Giocondo and Giuliano da Sangallo, proposed a Latin-cross plan (1516). Baldassarre Peruzzi proposed a return to the Greek-cross plan (1520; IV, PL. 189), A. da Sangallo the Younger favored a Latin-cross plan, and Michelangelo reproposed the Greek-cross plan surmounted by a central dome, articulated with ribs and fenestrated. Michelangelo's work (IV, PL. 193; IX, PL. 541) was continued after his death by Vignola and Pirro Ligorio. The dome was completed by G. della Porta and D. Fontana, who altered Michelangelo's plan. C. Maderno, who was entrusted with the completion of the basilica, returned to the Latin-cross idea, but he did not alter the parts already completed. Maderno built the façade (1607–14), articulated by six gigantic columns surmounted by an attic supporting statues of Christ and the apostles (II, PL. 269). Bernini (q.v.) was responsible for the plan of the square in front of St. Peter's (I, PL. 403). He added two projecting lateral wings to the church. From the lateral wings he extended elliptical colonnades (1657–63) of four rows of Doric columns and piers, surmounted by statues. The colonnades enclose the square, in the center of which is the monolithic obelisk of red granite, the ancient *meta* of the Circus of Nero. The obelisk is flanked by two fountains (one by C. Maderno, the other erected under Clement XI). The portico which was to have closed the ellipse of the colonnades was never executed. Access to the Apostolic palaces is obtained by the Scala Regia, designed by Bernini (II, PL. 270). Five doors give access to the church: the main door, a work of Filarete, has six sculptured panels and was designed for the old basilica; one of the side doors is by G. Manzù (1962). In the vestibule, facing the main door is Giotto's (q.v.) *Navicella*. The interior has three aisles, divided by grooved piers with Corinthian pilasters, and a broad transept and lateral chapels. Four pentagonal piers, constructed by Bramante and consolidated by Michelangelo, support the four arches on which the dome rests. The piers were embellished by Bernini with four niches, in which there are statues of saints (Bernini; II, PL. 275; A. Bolgi, F. Mochi, and F. Duquesnoy; II, PL. 168). Beneath the dome, which is decorated with mosaics after cartoons of the Cavalier d'Arpino (X, PL. 192), is the *confessio* (after designs by C. Maderno), where Canova's kneeling statue of Pius VI is placed. Above the *confessio* is the bronze baldacchino of Bernini, supported by four twisted columns and surmounted by a diadem-shaped element (II, PL. 267; IV, PL. 400). At the back of the apse is the Cathedra Petri, by Bernini (II, PLS. 135, 275, 280). Among the papal funerary monuments, the following are of particular importance: Innocent VIII (A. Pollaiuolo); Paul III (Guglielmo della Porta; PL. 208; IX, PL. 365); Urban VIII (II, PL. 275) and Alexander VII (both by Bernini; II, PL. 167); Leo XI (A. Algardi); Clement XIII (A. Canova); and Pius VII (Thorvaldsen). Other works include the bronze statue of St. Peter, sometimes considered a work of the 4th or 5th century but perhaps of the 13th (Arnolfo di Cambio?), and Michelangelo's *Pietà* (IX, PL. 526). The sacristy, by G. Marchionni, was begun in 1776 and consists of a great octagonal hall and several other rooms, including the Cappella dei Beneficiati, with a marble tabernacle by Donatello (1432). The Chapel of the Sacrament (Cappella del Sacramento) has an altar and a bronze ciborium by Bernini (IX, PL. 169), a screen by Borromini (II, PL. 219), and the *Trinity* by Pietro da Cortona. In the Vatican Grottoes are preserved fragments of the Early Christian church, mosaics (X, PL. 99), sarcophagi, and medieval inscriptions; noteworthy are the sarcophagus of Junius Bassus (I, PL. 301; II, PL. 282) and the tombs of Boniface VIII (Arnolfo di Cambio) and Sixtus IV (A. Pollaiuolo). Beneath the Grottoes is the Roman cemetery and the tomb assumed to be that of St. Peter.

From the basilica to the walls of the Porta Angelica extend the



Vatican City. *Key*: (1) Territorial boundary. Monuments and museums: (*a*) St. Peter's; (*b*) Sacristy; (*c*) Piazza S. Pietro and Bernini's colonnade; (*d*) Scala Regia; (*e*) Sistine Chapel; (*f*) Borgia Apartment and the Stanze of Raphael; (*g*) Logge of Raphael; (*h*) Cortile di S. Damaso; (*i*) Cortile del Belvedere; (*j*) Cortile della Pigna; (*k*) Library and Galleria delle Carte Geografiche; (*l*) Museo Pio-Clementino and the Octagonal Courtyard; (*m*) Museo Gregoriano and Museo Gregoriano Egizio; (*n*) Museo Chiaramonti and Galleria Lapidaria; (*o*) Pinacoteca; (*p*) Casino of Pius IV; (*q*) S. Stefano; (*r*) remains of walls of Leo IV; (*s*) Roman cemetery.

complex of buildings begun by Nicholas V (1455), enlarged and restored by later popes. The Scala Regia gives access to the Aula delle Benedizioni (Maderno) and to the Sala Regia (designed by A. da Sangallo the Younger and frescoed by various artists; IX, PL. 294). The Pauline Chapel contains frescoes by Michelangelo (IX, PLS. 534, 537). In the Sistine Chapel are frescoes by Perugino, S. Botticelli, Piero di Cosimo, Cosimo Rosselli, L. Signorelli, D. Ghirlandajo, Pinturicchio, and Bartolommeo della Gatta (1482); on the rear wall, the *Last Judgment* by Michelangelo (IX, PLS. 533, 536); on the ceiling, scenes by Michelangelo of the Creation, sibyls, and prophets (III, PL. 312; IX, PLS. 528, 535, 538); Cosmati pavement. Frescoed by Raphael are the Stanza della Segnatura (I, PL. 307; III, PL. 209; IV, PL. 230), Stanza d'Eliodoro, Stanza dell'Incendio (executed in large part by G. Romano and G. F. Penni), and Stanza di Costantino (completed after the death of Raphael by G. Romano and G. F. Penni). Adjacent to the Sistine Chapel are the Chapel of Nicholas V with frescoes by Angelico (I, PL. 270) and the loggias begun by Bramante and continued by Raphael, who supervised the decoration. The Borgia Apartment is almost entirely frescoed by Pinturicchio. The exedra of the Belvedere (II, PL. 346), by Bramante, was modified by P. Ligorio. The only work of Bramante surviving intact is a spiral ramp in a tower of the Belvedere (II, PL. 345). In the Vatican Gardens are the Rotunda and the Casino of Pius IV (PL. 429). Vatican Museums (for the most part in the palaces): Pinacoteca (including collection of Italian primitives, Leonardo, Raphael, Caravaggio, Poussin); Museo Pio-Clementino (X, PLS. 210, 212) and Museo Chiaramonti, with ancient sculpture and inscriptions; Museo Gregoriano Etrusco and Museo Gregoriano Egizio; Library (important codices); Museo Sacro (frescoes of the Augustan Age).

Some extraterritorial buildings were ceded to the Papal State in the Concordat of 1929. Among the more important structures in Rome are the Lateran Palace (including the museums), the basilicas of S. Paolo and S. Maria Maggiore, and the Palazzo della Cancelleria. In Castel Gandolfo are the Palazzo Pontificio and the Villa Barberini.

Piedmont and the Aosta Valley. The western part of the Po Valley (with the adjacent area of the Alps) was first inhabited by Ligurian peoples and, later, also by Celts. The region formed a border area between Italy and Gaul and subsequently between Italy and France. (Aosta now constitutes an autonomous region, within the Italian republic, and is distinct from Piedmont.) The area preserves imposing monumental remains of the Roman Imperial period. In the Middle Ages various feudal lords dominated the area until the Duchy of Savoy was established. Many modern towns have medieval origins. Romanesque and Gothic art flourished in the cities, abbeys, and castles; the castles are a particular characteristic of Aosta. Since the Renaissance, art in Piedmont has been rather close to that of Lombardy. The patronage of the house of Savoy favored a particular development of architecture during the baroque period, especially in Turin. The area has also witnessed important 19th- and 20th-century artistic developments.

a. Piedmont. Acqui (Lat., Aquae Statiellae or Aquae Statiellorum). On the left bank of the Bormida River, Acqui takes its name from thermal springs that were already in use during the Roman period. Inhabited by the Statielli, a Ligurian tribe of Celtic origin, it was a Roman municipium of considerable importance for its position at the intersection of the Via Aemilia Scauri, of which a part has been found, and the road to Augusta Taurinorum (mod. Turin). Ruins of the thermal establishment, mosaics near the warm spring, tombs, and remains of an aqueduct survive. In the Middle Ages Acqui became the capital of Upper Montferrat and passed to the house of Savoy in 1708. The Cathedral (1067), originally in the Lombard-Romanesque style, has been remodeled; the three semicircular apses (repeated in the crypt), transept, campanile (completed in 13th cent.), 17th-century atrium, and 15th-century façade portal (1405) are preserved intact. The old Cathedral, S. Pietro, was built in the 11th century on the site of a 5th-century Christian cemetery. Other structures of note include a cloister (14th cent.) with gallery; the Palazzo Vescovile (1460); and La Bollente, an octagonal aedicula under which gushes warm water and sulphurous vapors (1870; G. Ceruti).

Alba (Lat., Alba Pompeia). Located in an area of notable interest for the prehistory of the province of Cuneo, Alba became a Roman municipium in the 1st century B.C., taking its name from G. Pompeius Strabo. There are remains of the ancient city walls and gate and a late-antique building with a mosaic near S. Giuseppe. An episcopal seat from the 4th century, the town was devastated by Saracens in the 9th century and torn by internal and external strife during the late Middle Ages. In 1631 it passed to the house of Savoy. The center of the city, of almost circular plan, preserves numerous medieval towers (e.g., the four-storied Torre Astesiano). The influence of Lombard architecture is prevalent. The Cathedral, of Latin-cross type, has a nave and two aisles covered by ogival vaults and terminates in a presbytery over a crypt; it was remodeled in 1456 and restored in the 19th century. S. Domenico, a basilican church divided by pilasters and with a polygonal apse, is of Lombard inspiration. The Loggia dei Mercanti, with a pointed-arch portico; S. Giovanni Battista, with works by Macrino d'Alba and Barnaba da Modena; and the Church of the Maddalena, the floor plan of which is an ellipse inscribed in a rectangle (B. A. Vittone, 1749) are noteworthy. The Museo Archeologico "Federico Eusebio" houses prehistoric and Roman collections.

Asti (Lat., Hasta, Asta). A Roman municipium, an episcopal seat in the Middle Ages, destroyed in 1091, Asti developed again as a

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

commune, only to be devastated once more by Frederick Barbarossa in the 12th century. It passed to the house of Savoy in 1575. The medieval nucleus of the city, the so-called "enclosure of the nobles," was elliptical in plan and situated on the slope of the hill; it included a masonry wall, towers, and gates, built partly on Roman foundations. Asti expanded to the south and west to include the "enclosure of the villagers." A large number of medieval towers survive, including the Torre di S. Secondo (or Torre di S. Caterina), built on Roman foundations; the Troyana, Roero di Cortanze, Ponte di Lombriasco, S. Bernardino, or Comentina, and Guttari towers; and the octagonal Tower of the Three Kings, the only extant remains of the fortified royal palace. A number of Romanesque and Gothic houses have in part been preserved: Casa Bosia (12th–13th cent.); Palazzo Catena (11th cent.). Religious structures include the crypt of S. Anastasio (before 792) and the crypt of S. Secondo (before 10th cent.). The Baptistery of S. Pietro (called the "Rotonda") is a remarkable Romanesque octagonal edifice with a 12th-century dome. The Collegiate Church of S. Secondo (12th–15th cent.), in Lombard style, has a remodeled apse and an unfinished campanile. The Cathedral (1324–54), was built on the site of an 11th-century Lombard church; the apsidal part was lengthened by B. A. Vittone in 1764–69; it has a Gothic portico on the south side and a Romanesque campanile, reconstructed in 1266; in the interior are baroque frescoes. The Museo Archeologico is in the former Church of S. Pietro in Consavia, and the Pinacoteca in a 17th-century palace.

Vergano, Chiese romaniche nella provincia di Asti, Asti, 1960.

Biella. This city is first mentioned in a document of A.D. 826 with the name of Bugello. There is a Roman cemetery of the 2d century. The upper city (Biella Piazzo) was founded in 1160; until then the city lay only in the plain (Biella Piano), where the oldest monuments and the modern quarter are situated. Biella passed to the house of Savoy in 1379. A noteworthy Romanesque monument is the Baptistery, built of Roman remains, on a central plan with four apses and an octagonal dome (9th–10th cent.); in the interior are remains of frescoes. The adjacent Romanesque campanile belonged to the Church of S. Stefano (now destroyed). The Gothic Cathedral of the 14th century was remodeled in the 18th and 19th centuries. The Renaissance Church of S. Sebastiano has a façade rebuilt in the 19th century. Baroque churches include Sta Trinità (1626) and S. Filippo (18th cent.). S. Cassiano is neoclassic. In the upper city are the Romanesque Chapel of S. Giacomo, some 15th-century houses, Palazzo della Cisterna (16th cent.), Palazzo Gromo di Ternengo (16th cent.), with porch and loggias ornamented with terra cotta, and Palazzo Ferrero Lamarmora. The Museo Civico has Roman, Egyptian, and modern art.

Casale Monferrato. Mentioned for the first time in 1039 and destroyed in 1215 by the inhabitants of Alessandria and Vercelli, the town was restored and passed under the rule of various princes, until it became the capital of Montferrat in 1514. In 1681 its defenses were dismantled, and in 1703 it finally passed to the house of Savoy. Medieval remains are scanty. The 11th-century city tower was reconstructed in the 16th century and restored in 1921. The Cathedral was remodeled after the damages of 1215 and restored in the 19th century, with some few remains of the original Lombard-style construction. A few 15th-century palaces of late Gothic character are extant (notably, Casa Tornielli). S. Domenico (1469; restored in 19th–20th cent.) has a portal of 1505 by a follower of G. A. Amedeo. Baroque monuments include S. Paolo (1586; L. Birago), with rococo fittings, the work of Moncalvo (Guglielmo Caccia) and F. da Castello; S. Filippo, built by P. F. Guala (ca. 1667), on a Greek-cross plan with dome; S. Stefano (redone by Guala on site of 11th-cent. church). The Palazzo Municipale (1778) is rich in sculpture and frescoes. The Palazzo Gozzani di Treville was built in 1730 after a design by Giovanni Battista Scapitta (façade later). The Ospedale di Carità is by B. A. Vittone (1740).

Bibliog. P. D'Ancona, Due preziosi cimelii miniati nel Duomo di Casale Monferrato, L'Arte, XIX, 1916, pp. 85–87; N. Gabrielli, L'arte a Casale Monferrato dall'XI al XVIII secolo, Turin, 1935.

Chieri (Lat., Carrium, Carreum Potentia). This town was perhaps originally inhabited by the ancient Ligurians. A Roman military colony, Potentia, was established there in the 2d century B.C. In the Middle Ages it was subject to the bishops of Turin; Bishop Landolfo walled the town in the 11th century. Frederick Barbarossa destroyed it in the 12th century, but the town was soon rebuilt. It passed to the house of Savoy in 1418. The predominance of Lombard architecture is evident in the medieval structures. The 11th-century Cathedral was reconstructed in Lombard style in the early 15th century, altered in the 17th century, and restored in the 19th century. Nevertheless, it retains much of its original structure. The façade has a very high gable over the center portal. There are a nave and two aisles, with intercommunicating side chapels. (The Chapel of the Madonna delle Grazie was built by B. A. Vittone in 1757–59.) The 13th-century baptistery, of octagonal floor-plan, is Lombard Romanesque in the lower part and Gothic in the upper. The campanile is of the 14th century. Of the original Gothic construction of S. Giorgio (14th cent.) the polygonal apse and the internal form of nave and two aisles with ogival vault survive. S. Domenico (14th cent.) has a contemporaneous pinnacled campanile. The campanile of S. Antonio dates from the 13th century. Many houses have Romanesque and Gothic windows. S. Bernardino, designed by B. A. Vittone (1740–44), S. Antonio Abate, designed by F. Juvara (ca. 1764), and S. Filippo, with façade by G. Guarini and interior by F. Juvara are representative 18th-century churches.

In the environs is the Abbey of S. Maria di Vezzolano, completed in 1189 with superimposed loggias of Pisan derivation on the façade; the interior is formed of nave and two aisles, of which one serves as a side of the adjacent cloister; also preserved is a large pulpit carved in the French style and showing early Gothic features.

Caselle, La cappella dei Gallieri, Turin, 1960.

Ivrea (Lat., Eporedia). Situated at the beginning of the Aosta Valley, on the left bank of the Dora River, the city was a Roman military colony (from 100 B.C.), built on an earlier Gallic site. The regular castrum plan survives, along with part of the encircling Roman wall, the forum, and ruins of a theater and amphitheater. During the Middle Ages, Ivrea was a Lombard duchy and subsequently a marquisate; in 1313 it passed to the Savoy family, who built the castle (1358) on a square plan; there are round towers at the corners. The Early Christian Cathedral was rebuilt in the 11th century and remodeled in the 17th; in 1850 a neoclassic façade was added. The only parts of the old Romanesque structure preserved are the dome, the two Lombard-type campaniles, and the crypt. In the Cathedral are canvases by Defendente Ferrari and the 12th-century ivory reliquary of Varmondo d'Ivrea. Other Romanesque remains include a tower in the Vescovado and the campaniles of S. Domenico and the destroyed S. Stefano. S. Bernardino (15th cent.; deconsecrated) contains frescoes by G. M. Spanzotti (beginning of 16th cent.). S. Nicola da Tolentino (1605), a baroque church, has canvases by D. Ferrari. The Palazzo del Seminario was built by F. Juvara. S. Gaudenzio may have been designed by B. A. Vittone. The Olivetti industrial center, with its complex of factories and living and study centers, is a noteworthy example of contemporary design. The Museo Archeologico and the Museo "Garda" are in the Palazzo Comunale.

At nearby Pavone Canavese is a castle (10th–14th cent.) that once belonged to the bishops of Ivrea.

Mondovì. Founded in 1198 by the inhabitants of the village of Vico, Mondovì developed on the plain (Mondovì Breo) and on the neighboring hill (Mondovì Piazza). Ruled by various lords, it passed in 1418 to the house of Savoy. Its oldest remains include 14th–15th-century houses, towers, and churches. Particularly noteworthy is Mondovì Carassone, just outside the town proper, with the Church of S. Giovanni in Lupazzano and the Chapel of the Madonna delle Vigne. Baroque monuments are numerous and include the Church of the Gesù, by G. Boetto and others (with frescoes by A. Pozzo), S. Filippo, the Cathedral, and the Seminario (all by F. Gallo). Gallo

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

also completed the nearby Sanctuary of Vicoforte, which had been begun by A. Vittozzi in 1596.

Novara (Lat., Novaria). Situated in a plain, the city follows its ancient urban plan. Originally a Ligurian-Celtic center, it later became a Roman municipium. During the Middle Ages it was the seat of bishop-rulers and then a free city; after being ruled for a time by the Viscontis of Milan, Novara came under Savoy rule in 1734. Remains of the original Cathedral are preserved in the presbytery of the present Cathedral. The oldest parts of the Baptistery (octagonal in plan with corbel tables and three niches decorating each face of the exterior) date from the 4th–6th centuries; it was almost entirely rebuilt in the Romanesque period (11th cent.) and has undergone later remodelings. The Church of Ognissanti was built about 1045, but the original structure is almost entirely hidden by 18th-century alterations. The Broletto comprises three medieval buildings: the Palazzo del Comune (1205–08) with portico, external staircase, and a great hall on the first floor, all typical of the period; the 15th-century Palazzo del Podestà; and the 13th-century Palazzetto dei Paratici, with a Gothic portico and terra-cotta decorations on the window apertures of the first floor. Notable among the Gothic civil edifices is the Casa della Porta (15th cent.). Late Renaissance architecture in Novara includes S. Gaudenzio (begun 1577), by P. Tibaldi, with works by G. Ferrari, Tanzio da Varallo, and others; the campanile is by B. Alfieri and the dome by A. Antonelli (19th cent.). Baroque monuments include S. Marco (1607–14), by A. Mazzenta, with frescoes by Moncalvo and canvases by D. Crespi; the Church of the Rosario (or S. Pietro), with works by G. C. Procaccini and Fiammenghino (Giovanni Mauro della Rovere); and S. Eufemia, rococo in taste, especially the interior. The architecture of the 19th century is represented by the Palazzo del Mercato (1817–39), the Teatro Coccia (1886; G. Oliverio), and the buildings of A. Antonelli (e.g., Cathedral, 1863–65, built on the site of an 11th-century structure). The Corso Vittorio Emanuele, which is flanked by porticoes, has a neoclassic air. The Museo del Broletto contains archaeological finds and a collection of 15th–18th-century paintings. The Galleria Giannoni houses modern art. There is also an ethnographical museum.

Saluzzo (Lat., Saluciae). Mentioned for the first time in a document of 1028, Saluzzo was the seat of a rich and flourishing marquisate until the 16th century. The end of the 15th century was a period of particular brilliance and building activity. Numerous towers and houses with Gothic remains are preserved. Of "La Castiglia," the 13th-century castle of the marquises of Saluzzo (rebuilt in the 19th century), there survives a fortified tower of the medieval structure. The 15th-century Casa Cavassa (Cavazza) has a marble portal attributed to Matteo Sanmicheli. The 15th-century Casa di Davide has Gothic windows decorated with terra cotta. The Gothic apse of S. Giovanni (13th cent.; enlarged in 1472) was originally intended as a funeral chapel and is known as the Cappella di Sto Sepolcro. The tomb of Ludovico II is attributed to B. Briosco. There is a cloister, a chapter house (containing the tomb of G. Cavassa, by M. Sanmicheli, 1528), and a campanile with single-mullioned windows. The late Gothic Cathedral (begun 1492) has an apse, ambulatory, and baroque campanile. S. Agostino (1500) is Lombard Gothic. The Fontana della Drancia has a 15th-century basin. The Ospedale and Palazzo Municipale (1726) were designed by F. Gallo. The Casa Cavassa houses the local museum.

Near Saluzzo is the Cistercian Abbey of Staffarda (12th cent.; restored), whose church has a Romanesque façade. The campanile is of Lombard type. The cloister (13th–14th cent.) has paired columns, and the chapter house is Gothic.

Bibliog. E. Milano, Monumenti artistici in Saluzzo e nel suo territorio, Arte e storia, XXXI, 1912, pp. 77–85; G. Vacchetta, La chiesa di San Giovanni di Saluzzo, Turin, 1931. For Staffarda: D. Susa (Lat., Segusium). Situated at the junction of the Susa and Mont Cenis valleys, Susa was successively a Segusian *oppidum*, the residence of King Cottius, a Roman *vicus*, and, during the Augustan period, the capital of the province of the Cottian Alps. It preserves important ancient monuments, including parts of the late 3d-century wall and of the amphitheater, as well as the Arch of Augustus (12 B.C.), with a sculptural frieze commemorating the pact of friendship between Rome and the Alpine populace (PL. 230). The town was destroyed by Constantine as punishment for siding with Maxentius, but rose again in the Middle Ages. Except for the castle and the churches, it was again burned to the ground by Frederick Barbarossa in 1168. Save for short periods of French domination, it belonged to the house of Savoy from 1047. Outside the old city walls is the Borgo dei Nobili (12th–13th cent.), founded by Savoy families and containing many houses of medieval origin. The remains of the Church of S. Maria Maggiore are Romanesque and include two campaniles. The Church of S. Francesco and the Casa De Bartolomeis are Gothic. The Cathedral, founded shortly after 1000, was reconstructed in the Gothic style and successively altered; it is rich in 14th-century works. Only the campanile survives of the original design. The Museo Civico has archaeological material.

Some distance from the town, in an isolated position on Monte Pirchiriano, is the Sagra di S. Michele, a fortified medieval monastery. The church has a nave, two side aisles, three semicircular apses (the center one with a large window and Romanesque sculptured reliefs showing French influence), and a crypt begun in the 12th century (on the remains of an 11th-century predecessor) and finished in the 13th century; the decoration of the Portal of the Zodiac includes some of the earliest sculpture of Master Nicolaus (q.v.).

Turin (Lat., Augusta Taurinorum; It., Torino). The city is set in the plain of the Po, except for a modern part which extends onto higher ground. It was founded in 29–28 B.C. as a Roman military colony (Augusta Taurinorum) in the territory of the Ligurian Taurini at the point where the road from Monginevro joined the road to Milan. The modern city plan follows the original Roman castrum plan of blocks approximately 230 ft. long. Parts of the Roman wall still stand, including the Porta Palatina; next to the gate is the Roman theater with a *post-scaenam* portico. The city was the capital of a Lombard duchy, then of a French marquisate; it became a free city and in the 13th century passed to the house of Savoy. Until the reign of Emmanuel Philibert (1553–80), the city remained largely within the limits of the Roman walls. Little noteworthy architecture of that early period remains.

Surviving Romanesque monuments are the Campanile of the Consolata (11th cent.) and a part of the Palazzo Madama. (Remains of the substructure of a Roman gate can be seen inside the palace.) Gothic structures include the Church of S. Domenico (1300–44; subsequently restored, with a simple façade divided by three projecting pilasters topped by pinnacles, and some houses (in the Via Conte Verde and Via T. Tasso) whose lancet windows are decorated with terra cotta.

The Cathedral, one of the few Renaissance buildings in Turin, was begun in 1490 by Meo del Caprina, who probably also designed the façade; the interior contains work by D. Ferrari, B. Caravoglia, and P. Le Gros; behind the raised presbytery is the Chapel of the Sta Sindone (II, PL. 143), designed by G. Guarini (q.v.). Emmanuel Philibert began the real architectural embellishment of the city. Architects from central Italy (e.g., F. Paciotti, P. Tibaldi) went to Turin. The Palazzo S. Giovanni, which preceded the present Royal Palace, was built. The city was encircled with a powerful defensive system (the keep of the citadel survives; 1564–68), and many churches were built. Among the churches are S. Dalmazzo, S. Agostino, SS. Martiri, and S. Tommaso (1585; remodeled in 19th cent.). Ascanio Vitozzi redesigned the Piazza Castello (1584) and the connecting Via Nuova (now Via Roma), maintaining the checkerboard pattern of the ancient city, built the Church of SS. Trinità (1590–1606;

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

partly redone by Juvara, who decorated the interior), the Church of Corpus Domini (1609–71; restored in the 18th cent. with decorations by B. Alfieri), and the Church of Sto Spirito (1610), a Greek-cross structure restored in the 19th century. Vitozzi also built the church on the Monte dei Cappuccini (1585) and the Villa della Regina (1616; enlarged by A. di Castellammonte; façade rebuilt in the 18th cent. by P. A. Massazza di Valdondona).

Intensive building activity under Charles Emmanuel I and II saw the completion of the rectangular Piazza S. Carlo by Carlo di Castellamonte, construction of S. Cristina (1639; façade by F. Juvara, 1714), and the rebuilding (1633–38) of the Castello del Valentino. Several baroque churches were constructed in the center of the city, including S. Teresa (1642–74; with chapel and side altar by F. Juvara; works by S. Conca and C. Giaquinto); the two main streets (now Via Verdi and Via Po) leading from the Piazza Castello were opened. Via Po is flanked by palaces with porticoes, after the plan of Amedeo di Castellamonte, who in 1646 had begun the Royal Palace (gardens after a design by the French architect Andre Le Nôtre) and completed the Ospedale Maggiore (Ospedale di S. Giovanni). Francesco Lanfranchi built the Palazzo di Città and the churches of S. Rocco (1667), SS. Maurizio e Lazzaro (1679; façade, dome, and interior decoration, 19th cent.), and the Visitazione (1661). The palaces of the same period include the Palazzo Barolo (with a double-ramped staircase), the Palazzo Paesana di Saluzzo (ca. 1720; by G. Planteri with a richly decorated courtyard and interior) and the Palazzo dell'Accademia Filarmonica.

Much of the credit for the great surge in building during the second half of the 17th century must go to the two architects Guarino Guarini and Filippo Juvara (qq.v.). Guarini's major works are: the completion of the Church of S. Lorenzo (II, PLS. 142, 143; VII, PL. 103), the previously mentioned Chapel of the Sta Sindone, the Palazzo Carignano (VII, PLS. 104, 105), the Collegio dei Nobili (now the Accademia delle Scienze; 1679), and the Church of S. Filippo Neri (reconstructed by Juvara; neoclassic façade of 1835, aisleless

interior flanked by elliptical side chapels and works by F. Solimena, F. Trevisani, Guercino, G. B. Tiepolo, C. Maratti). Juvara, the other great baroque architect in Turin, is especially noteworthy for his attempts to integrate his buildings within the entire urban complex. He designed whole new areas of the city (e.g., the Quartieri Militari), worked on the façade of the Palazzo Madama (PL. 226), the façade of the Palazzo Ferrero d'Ormea, the Palazzo della Corte d'Appello (completed by B. Alfieri and I. Michela), Palazzo Martini di Cigala, Palazzo della Valle di Panaro, and the churches of Sta Croce and the Carmine. Juvara influenced B. Alfieri and B. A. Vittone. Alfieri completed the Piazza Castello by erecting the Teatro Regio, designed the Piazza del Palazzo di Città, and built the Palazzo Chiablese. Vittone was responsible for S. Chiara (1745) and S. Maria di Piazza (1751; 19th-cent. façade).

Later works were carried out by the French during the Napoleonic occupation: the Ponte Vittorio Emanuele I was built to connect the vast porticoed Piazza Vittorio Veneto with Piazza Gran Madre di Dio, where F. Bonsignori's Church of the Gran Madre di Dio (1818–31), modeled after the Pantheon, is situated. The 1860s and 70s saw the laying out of Piazza Statuto, the construction of the Stazione Centrale, by A. Mazzucchetti and C. Ceppi (1866–68; later modified), the creation of the new areas of the Crocetta (1859), the Corso Vinzaglio (1872), and the Piazza d'Armi (1880). During the 19th and early 20th centuries the principal piazzas were adorned with many commemorative monuments, including the monument to Emmanuel Philibert by C. Marocchetti in Piazza S. Carlo (X, PL. 149). Among the modern works have been the reorganization of stretches of the Via Roma (1931–37; M. Piacentini and others) and the building of the Galleria S. Federico by E. Corte. In the same period came the first successes of rational architecture: the Fiat-Lingotto factory (ca. 1919; by Mattè Trucco), the stadium with the adjacent athletic center (1933; Bianchini, Fagnoni, Ortensi), the Fiat-Mirafiori factory (1939; Bonadè, Bottino), and the Palazzo E.I.A.R. (1939; later remodeled). Among the more important contemporary works are the Salone dell'Auto and the Palazzo del Lavoro, both by P. L. Nervi; the Nuovo Auditorio, by A. Morbelli; the Lancia office building, by N. Rosani; and the Galleria d'Arte Moderna (1959), by C. Bassi and G. Boschetti.

Museums include the Museo Civico di Arte Antica (in the Palazzo Madama) and the Galleria dell'Accademia Albertina; in the Palazzo delle Scienze: Galleria Sabauda, Museo Egizio, and the Museo di Antichità, the latter with archaeological material from prehistoric through late Roman times.

In the environs of Turin: the Basilica of Superga by F. Juvara (1715–31; II, PL. 140). The hunting lodge, or castle, of Stupinigi (I, PLS. 389, 407; II, PL. 141), also by Juvara, is in a park with contemporaneous tenant houses; the plan is in the form of a St. Andrew's cross whose arms extend toward the southwest to form a great octagonal piazza; the interior (on which B. Alfieri collaborated) has frescoes and canvases by V. A. Cignaroli, G. B. Crosato, Giuseppe and Domenico Valeriani, and C. A. van Loo. The castle of Venaria Reale was originally designed by Amedeo di Castellammonte and restored by Juvara and Alfieri; the hunting lodge of Venaria Reale was built by Juvara; the parish church was reconstructed by B. Alfieri. At Carignano: 14th- and 15th-century houses (Via Monte di Pietà, Via Vittorio Veneto, and Via Bastioni), some with portals and terra-cotta decoration; 17th-century churches of S. Giuseppe and Sto Spirito; Ospizio di Carità (1749), designed by B. A. Vittone.

Varallo. Mentioned in a document of 1028, Varallo was a feudal domain of the Biandrate and then a commune. S. Maria delle Grazie (15th cent.) has a fresco cycle by G. Ferrari (1513). S. Gaudenzio (13th cent.), rebuilt in 1710, has a polyptych by G. Ferrari. On a hill overlooking the town is the Sanctuary of Sacro Monte, comprising 45 chapels built between 1490/91 and 1765, rich in frescoes [especially noteworthy, those by G. Ferrari, P. F. Mazzuchelli (Morazzone), and Tanzio da Varallo] and sculpture. The 17th-century Church of the Assunta, with a 19th-century façade, is included in the complex. A short distance away is the Chapel of the Madonna di Loreto (15th cent.), with frescoes by A. Zanetti, G. Ferrari, A. Solari, T. Cavalazzi, and B. Luini. The Museo Civico Pietro Calderini contains archaeological material.

Vercelli (Lat., Vercellae). Originally a Roman municipium, Vercelli was successively an episcopal seat, a Lombard duchy, and a French county. While a commune, the town was surrounded by walls. Vercelli passed to the house of Savoy in 1761. The 13th century was a particularly prosperous period for the town. The Church of S. Bernardo (1164) is Romanesque in the front, but the apse is modern. S. Giuliano is Romanesque, with nave and two aisles and contemporaneous campanile (remodeled interior). The Romanesque Church of S. Paolo (1262), with nave and two side aisles, was altered in the 18th century but preserves the original façade and campanile; the interior was partially redone in the baroque period. The Ospedale Maggiore and the Castle are 13th-century structures. S. Andrea (VI, PL. 332; restored in the 19th cent. and in 1927) represents the transitional period between Romanesque and Gothic; it is the work of Lombard masters who apparently were sensitive to French influences. The façade, flanked by two campaniles, has a lunette attributed to B. Antelami (I, PL. 297). The adjacent abbey is of the Cistercian type and has a cloister with Romanesque columns and 16th-century vaults. The Casa Alciati and the octagonal Torre dei Tizzoni are 15th-century structures. The former Casa Centoriis has a Renaissance courtyard (1496). The Church of S. Cristoforo (1526), another Renaissance building, preserves a fresco cycle and the *Madonna del Melarancio*, a large canvas, both by G. Ferrari. The original Cathedral was built on the site of Roman and Early Christian buildings but reconstructed by P. Tibaldi in 1572 and rebuilt in part in the 18th century, with an atrium by B. Alfieri; an annex houses the Biblioteca Capitolare, which contains many illuminated manuscripts; there is a 12th-century campanile. Baroque monuments include the Seminary, the Palazzo Avogadro Della Motta (18th cent.), Palazzo Langosco (1707; with a beautiful portal), and Palazzo del Governo. The Church of S. Chiara is by B. A. Vittone. S. Lorenzo was built toward the end of the 18th century. The Museo Camillo Leone occupies the Casa degli Alciati and the Palazzo Langosco. The Museo Borgogna contains paintings of the 14th–19th centuries. The Cathedral Treasury contains liturgical furnishings of the 8th–12th centuries and Gothic and Renaissance goldsmith work.

b. Aosta Valley. Aosta (Lat., Augusta Praetoria). The Roman colony was founded by Augustus in 25 B.C. in the territory of the Ligurian Salassi, at the juncture of the roads to the Little Saint Bernard and Great Saint Bernard passes. Aosta preserves the rectangular Roman castrum plan of blocks 230×260 ft., as well as large parts of the surrounding wall, two Roman gates, the Roman bridge over the Buthier River, the monumental Arch of Augustus, the Roman theater, the forum, a temple, and the amphitheater. Various lords dominated the city during the early Middle Ages; in the 11th century Aosta passed to the house of Savoy. The Cathedral (11th–12th cent.; crypt preserved), totally rebuilt in the 15th and 16th centuries, has a nave covered by rib vaults, two barrel-vaulted side aisles, and an ambulatory; in the choir are a 12th-century mosaic pavement and

UP State Museum, Lucknow

sculptured choir stalls by Jean Vion of Samoëns and Giovanni di Chetro. The Cathedral Treasury contains a 15th-century reliquary and an ivory diptych depicting the Emperor Honorius (406). The lower part of one of the two campaniles dates from the 11th century. The neoclassic façade dates from 1848. Adjacent to the church is the cloister (1460). The Early Christian Church of S. Orso was rebuilt in the 15th century. The cloister, also rebuilt in the 15th century, has columns and historiated capitals from the original structure (before 1133). The four-storied campanile was erected in the 12th–13th century. The 15th-century priory consists of three separate structures, each with a porch facing the church. Other medieval remains include numerous towers and the campanile of S. Benigno. Among the 17th- and 18th-century buildings are S. Stefano, Sta Croce, and the Palazzo Vescovile. Particularly noteworthy is the early 16th-century Palazzo Roncas. Museums include the Museo Archeologico, the Cathedral Treasury, and the Treasury of S. Orso.

Lombardy (It., Lombardia). Occupying the central Po Valley and the adjacent Alpine foothills, Lombardy preserves modest remains of lake villages and of the Golaseccan and Celtic cultures. Important Roman cities were established in the region, including Mediolanum (mod. Milan), which was the residence of the Roman emperors in the 4th century. But only after the Lombard conquest did the province become the center of original and intense artistic activity; it excelled in gold- and silverwork, sculpture, and above all, architecture, culminating in the work of the *magistri comacini* and in the Lombard Romanesque style. Later, fine monuments were created in the Gothic and Renaissance styles. During the Renaissance, a school of painting flourished in Lombardy, and Leonardo da Vinci and Bramante were active in a prosperous period of Milan's history. The subsequent history of Lombardy under Spanish and Austrian rule offers no remarkable artistic developments except for Milanese neoclassicism.

Abbiategrasso. The town was established in the Middle Ages and flourished under the Visconti and Sforza families. The castle, which had existed as early as the year 1000, was partially destroyed by Frederick Barbarossa in 1167. It was rebuilt by Gian Galeazzo Visconti in 1382; altered subsequently, it preserves remains of its tower and 14th-century windows. S. Maria Nuova was begun in 1375, and the interior was remodeled by F. Croce in 1740; a porch in the form of a large arch was added to the façade by Donato Bramante in 1497; a 15th-century atrium decorated with terra cotta and sculpture stands before the church. The neoclassic Pia Casa degli Incurabili was designed by L. Pollak and G. Balzaretti (1784).

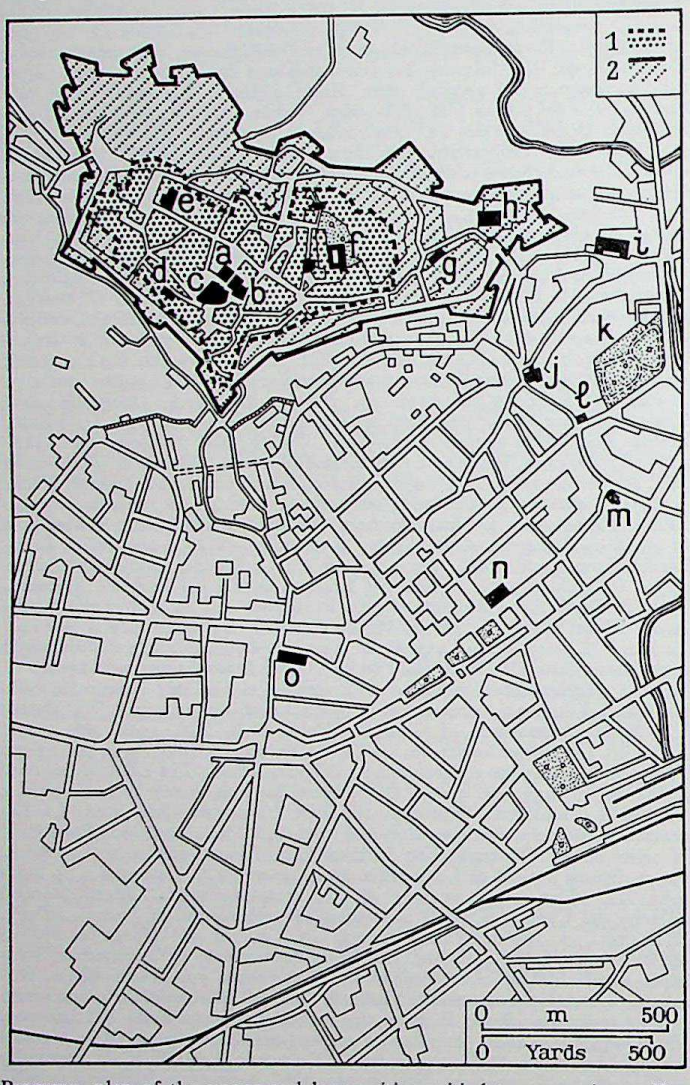
Bergamo (Lat., Bergomum). The city was originally a Gallic settlement, then a Roman municipium, and an episcopal seat from the second half of the 4th century. Situated at the mouth of the Brembana and the Seriana valleys, Bergamo consists of two parts — the older, upper city, still enclosed by the Venetian walls (1561–88); and the modern, lower city, much larger than the upper city and completely remodeled by M. Piacentini (1919–29). In the upper



Bergamo, plan of the upper and lower cities, with later expansions. *Key*: (1) Original urban nucleus within the medieval walls; (2) expansion of the city within the Venetian walls of the 15th–16th century. Principal monuments. Upper city: (*a*) Palazzo Vecchio (Palazzo della Ragione); (*b*) Cathedral; (*c*) Baptistery, S. Maria Maggiore, and Colleoni Chapel; (*d*) S. Grata inter Vites; (*e*) Church of the Carmine; (*f*) the Rocca; (*g*) S. Michele al Pozzo Bianco; (*h*) former Church of S. Agostino. Lower city: (*i*) Palazzo dell'Accademia Carrara; (*j*) S. Alessandro della Croce; (*k*) public park; (*l*) S. Bernardino in Pignolo (*m*) Sto Spirito; (*n*) S. Bartolomeo; (*o*) S. Alessandro in Colonna.

city traces of the Roman wall and street layout, as well as the site of the forum, have been identified. Remains of an elaborate thermal structure, an aqueduct, a large reservoir, and a few tombs have been discovered.

As a Lombard duchy and a Frankish county during the Middle Ages, the city led a tempestuous existence. From 1428 to 1797 it belonged to Venice. The Cathedral was rebuilt by Antonio Filarete in 1459, renovated in 1689 by C. Fontana, and is richly decorated within (paintings by G. Moroni, S. Ricci, and G. B. Tiepolo). In the Piazza Vecchia is S. Maria Maggiore (1137), the most remarkable Romanesque monument of the city. Lacking a façade and hidden in part by other edifices built against it, the church preserves at the end of the left transept a notable porch by Giovanni da Campione, with an equestrian statue of St. Alexander (1353; III, PL. 21). At the end of the right transept is a porch with depictions of the Labors of the Months, also by a Campionese master (see CAMPIONESI). The interior was remodeled in the baroque period and crowned with an octagonal dome by F. M. Richini (1615); it contains choir stalls with intarsia work after designs by L. Lotto and the tomb of Guglielmo Longhi, attributed to Ugo da Campione (III, PL. 19). In front of the Cathedral is the octagonal Baptistery (1340; Giovanni da Campione), formerly in S. Maria Maggiore, poorly restored in 1898; within are carved panels, by an anonymous Lombard master, which were perhaps part of the baptismal basin. The Colleoni Chapel, which abuts on S. Maria Maggiore, has a polychrome façade of the early Lombard Renaissance (G. A. Amadeo, 1470–76); within the chapel (remodeled in the 18th cent.) are the tombs of Bartolommeo Colleoni and his daughter Medea. Between Piazza del Duomo and Piazza Vecchia is the Palazzo della Ragione (existing as early as 1199), which in spite of several restorations has retained its original appearance. Opposite is the Palazzo Nuovo, begun by A. Vannone (ca. 1593) and continued on a Palladian design of V. Scamozzi (1611); the façade was completed in the 20th century. Also in the upper city are the Church of the Carmine (with an early 16th-century cloister), rebuilt in 1730 by G. B. Caniana; S. Andrea, documented as early as 785 but reconstructed 1840–47; the former Church of S. Agostino, with a 15th-century façade; and various Renaissance secular structures (e.g., Casa dei Rivola, Casa Passetti, Casa dell'Arciprete, and Casa Grumelli).

The lower city also preserves several noteworthy churches and buildings: S. Bernardino al Pignolo, late Gothic (restored), with painting by L. Lotto; S. Bartolomeo, reconstructed in the 17th century (painting by Lotto); Sto Spirito, rebuilt in 1521 [altar frontal by Lotto, polyptych by Il Bergognone (Ambrogio da Fossano)]; S. Alessandro della Croce (17th cent.); and the Palazzo dell'Accademia Carrara, neoclassic, by Galizioli (enlarged by Simone Elia). To the renovations of Piacentini (1919–29) belong the Piazza Vittorio Veneto and Piazza Dante. F. Rota's Tempio Votivo, a war memorial, was consecrated in 1952. Museums include the Galleria dell'Accademia Carrara, which contains work from the Venetian, Lombard, and Tuscan schools of the 15th and 16th centuries, and the Museo Archeologico.

Brescia (Lat., Brixia). An important Cenomanian settlement, Brescia came under Roman domination in 225 B.C. and became a colony in 27 B.C.. In the 6th century it was a Lombard duchy and during the 12th century a free commune; then it was ruled successively by the Torriani, Scaliger (Della Scala), and Visconti families; and in the 15th century it was annexed to the Venetian Republic. The grid plan of the Roman streets and the site of the forum have been identified. The principal Roman ruin is the Capitolium, dedicated A.D. 72–73 but built on the site of a republican predecessor. The ruins of the forum, curia, and theater are especially noteworthy. Of less importance are the remains of an aqueduct, bridge, and thermal building.

From the period of Lombard domination, some remains survive of the Church of S. Salvatore (8th cent.), under which an older church has been excavated (1957). Remains from the communal period are more extensive and better preserved. The Rotonda, or Old Cathedral (PL. 171), preserves the crypt of S. Filastrio (11th cent. or possibly earlier) and a 15th-century presbytery. The Cathedral was built on the site of S. Maria Maggiore (6th–7th cent.), of which some mosaic pavement fragments remain. The Broletto (12th–17th cent.), restored to its original form, has mullioned windows, decorated with sculpture, facing on an interior courtyard. The palace is dominated by the Torre del Popolo (begun in 11th cent.). S. Maria in Solario is a 12th-century oratory consisting of a polygonal upper structure on a square lower structure and crowned by a dome. The façade of S. Francesco is of the 13th century. Venetian in spirit: the Monte di Pietà (or Monte Vecchio, 1484; A. Zur-

In the Piazza della Loggia are two Renaissance structures,

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

lengo); and the Palazzo Comunale (or Loggia), begun by T. Formenton(e) (1492) and worked on by J. Sansovino (1554), G. Alessi, A. Palladio, and G. A. Rusconi (1562). P. M. Bagnadore built the Palazzo del Monte Nuovo (1597) and probably also the palace with the Torre dell'Orologio. The Church of S. Giovanni Evangelista (15th cent.) preserves several panels by Moretto da Brescia. The Church of the Madonna del Carmine was begun in 1429. The Church of S. Maria dei Miracoli (1488–1581) was bombed in 1945, but the original façade, decorated with reliefs, survives. The Romanesque Church of S. Pietro in Oliveto was rebuilt in 1510. S. Giuseppe was built in 1521–78. The Church of the Madonna delle Grazie was built by L. Barcella (1522). The New Cathedral, built by G. B. Lantana (1604), Renaissance, has a Greek-cross plan; the dome is by L. Cagnola (1825); preserved inside are the shrine of SS. Apollonius of Brescia and Filaster (1510), of Venetian influence, and paintings by Romanino. Numerous palaces were erected during the Renaissance, including several by L. Beretta: Cigala, Maggi di Gradella, Martinengo da Barco (beginning of 16th cent., rebuilt in 1680). The Castle, in its present state, dates from the 16th–17th century.

During the baroque period were built the Palazzo Martinengo Cesaresco (1663; now the Questura), the Church of the Carità (1640), and the Church of SS. Faustino e Giovita (S. Carra, after 1622; frescoes by G. D. Tiepolo). Structures of the 18th century include S. Zeno (1745); SS. Nazaro e Celso (18th-cent. façade), which has a polyptych by Titian (depicting the Resurrection, Annunciation, and saints) and a Coronation of the Virgin by Moretto da Brescia; S. Maria Calchera, with paintings by Moretto da Brescia and Romanino; and S. Eufemia (1776), with a 15th-century crypt. The Fé, Bruni-Conter, and Gambara palaces are by A. Marchetti. S. Maria della Pace (G. Massari), the Palazzo Pancera Zoppola, the cemetery (1815; R. Vantini), and S. Alessandro (façade, 1894; an Annunciation by J. Bellini, ca. 1444) are neoclassic. The Piazza della Vittoria (M. Piacentini, 1932) is the center of the modern city. The new Ospedale Civile was begun in 1938, after a design by A. Bordoni. Museums include the Museo Romano, Museo Cristiano, and the Pinacoteca Civica Tosio Martinengo.

Castiglione Olona. Possibly of Roman origin, the town owes its present appearance to the numerous buildings erected between 1420 and 1440 under the patronage of Cardinal Branda Castiglioni. The Chiesa di Villa (1432–35) shows the influence of Brunelleschi; flanking the portal are colossal statues of St. Anthony and St. Christopher, probably by Jacopino da Tradate. The Collegiate Church (1421) preserves frescoes of the life of the Virgin by Masolino (q.v.), the life of St. Stephen, perhaps by Il Vecchietta, and the life of St. Lawrence, possibly by Paolo Schiavo, as well as the tomb of Cardinal Branda Castiglioni by a Campionese master. The Baptistery has a cycle of frescoes of the life of John the Baptist by Masolino (IX, pls. 375, 376). There is a landscape frescoed by Masolino in the Casa Castiglioni.

Castelseprio (Lat., Sibrium). Originally a settlement of the Insubres, then a Lombard castrum, Castelseprio is now in ruins. There are remains of the encircling wall with square towers, of the castle (destroyed in 1287), S. Giovanni Evangelista, the 6th-century Baptistery, and S. Paolo (11th cent.). A short distance from the site of the castrum is the most noteworthy monument, the Church of S. Maria Foris Portas (7th–8th cent.). It is built on a trilobed rectangular plan, preceded by a large narthex. Preserved within is an important fresco cycle depicting the Infancy of Christ, attributed by some authorities to the 7th–8th century and by others to the 9th; the frescoes are virtually the sole surviving example of pre-Ottonian fresco painting in Lombardy and are in all probability by an itinerant eastern master (II, pl. 445).

Civate (formerly Clivate). The town developed around the Benedictine monastery said to have been founded in the 8th century by Desiderius, the last king of the Lombards. Of the monastery, only the small Church of S. Pietro al Monte and the Chapel of S. Benedetto survive. S. Pietro al Monte was almost completely rebuilt toward the end of the 11th century, when a second apse intended as an imperial loggia and reminiscent of Carolingian *Westwerke* was added. The church has a single aisle and a crypt. Corbel tables supported by pilasters form the external decoration, while inside are a notable ciborium decorated with 11th-century stuccowork and an important cycle of frescoes (11th–12th cent.). The Chapel of S. Benedetto has a single cross vault and a square, triapsidal presbytery; the altar is decorated with paintings contemporary with those in S. Pietro. Within the Casa del Cieco (formerly the Monastery of S. Calogero) is the Church of S. Calogero, completely rebuilt, in which were discovered a series of frescoes of Old Testament scenes that are related to those in S. Pietro and may date from the beginning of the 12th century.

Pietro in Monte a Civate, L'Architettura, V, 1959–60, pp. 849–53.

Como (Lat., Comum, Novum Comum). The city lies at the southwestern extremity of Lake Como. First settled by Gallic tribes, it later became a Roman colony and a municipium. In the late Empire it was a naval base of considerable importance because of its proximity to Mediolanum (Milan). The Byzantine general Narses fortified the city in the 6th century. In the Middle Ages it became part of the Lombard duchy of Milan, then a Frankish fief, and in the 12th century a free commune. Torn by the conflict between the Guelphs and the Ghibellines, it finally passed to the Viscontis of Milan.

Roman monuments include remains of a late wall, probably built on a republican predecessor; the Porta Praetoria, rebuilt during the late Empire (perhaps 3d cent.); remains of a thermal establishment; and a fine late Roman house. Columns perhaps of the 3d century support the porch of S. Cecilia. No medieval monument dating before the 11th century survives. Romanesque monuments, however, are numerous, though often mutilated or rebuilt. Ruins of the 11th-century Palazzo Vescovile were discovered in 1939. The 11th-century Church of S. Abbondio is almost intact. The church has a nave and four side aisles, an internal narthex, twin campaniles (one rebuilt in the 19th cent.), and 14th-century frescoes in the apse. S. Fedele (12th cent.) represents a novel fusion of the basilican and central plans. Noteworthy are the apse with internal and external loggias and the sculpture of the adjacent portal. Of the 12th-century structure of S. Giacomo, the transept, dome, and a portal survive. A five-storied medieval gate tower (the Torre di Porta Vittoria; 1192) stands near the Roman gate. The Broletto (1215) is early Gothic.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

It was partly demolished to make way for the Cathedral, which was begun by Lorenzo degli Spazi (1396) and continued by Pietro da Brescia (1426). The late Gothic façade (PL. 187) was designed by Florio da Bontà; the façade sculpture is by the Rodari family (late 15th cent.); the right transept is by F. M. Ricchino (1627–33) and the left by C. Buzzi (1653–69). The apse is by Tommaso Rodari (1513) and the dome by F. Juvara. The church contains sculpture by T. Rodari and paintings by G. de' Ferrari, B. Luini, and Morazzone. The Church of the Annunziata (or Santuario del Crocefisso; 1564–74) has a neoclassic façade and chapels decorated by C. Carlone (1726) and Morazzone. S. Giorgio is baroque (1644; built over a previous church), with frescoes by G. P. Recchi (1686). The neoclassic Villa Olmo (1782) is by S. Cantone, and the Cimitero Maggiore was erected after a design by L. Tatti. Modern structures include the Tempio Voltiano (1927) by F. Frigerio, A. Sant'Elia's monument to the war dead, and the Casa del Fascio by G. Terragni (V, PL. 112). The Museo Civico is in the Palazzo Giovio and contains archaeological finds.

Near Como are the Romanesque Church of S. Carpoforo (11th–12th cent.) and the Villa d'Este, Cernobbio (16th cent.); the Villa Carlotta (1747), between Cadenabbia and Tremezzo, has sculpture by A. Canova and B. Thorvaldsen.

Crema. Perhaps of Celtic origin, Crema was a fief in the 11th century and then a free commune. Destroyed by Frederick Barbarossa in 1160, the city was rebuilt in 1185. It belonged to the Venetian Republic from 1449 to 1797. The Lombard Gothic Cathedral was built in the 13th–14th century and preserves an old Romanesque portal (perhaps from the structure destroyed by Barbarossa); the interior was remodeled in the 17th–18th century. The central Piazza del Duomo is surrounded by 16th-century porticoed buildings. The baroque Palazzo Terni De Gregori was built in 1698 by G. Cozzi. The Church of SS. Trinità is the work of A. Nono (1739).

Outside Crema is the Church of S. Maria della Croce, a structure of Bramantesque character by G. Battagio (1493; completed by A. Montanaro). A short distance from Crema is the Church of S. Maria di Bressanoro, rebuilt in the 15th century in a mixture of Gothic and Renaissance styles.

Cremona. A Roman colony was established in 218 B.C. and became a municipium in 90 B.C.; a stronghold of the supporters of Vitellius in A.D. 69, Cremona was destroyed and then rebuilt by Vespasian. The modern city retains the rectilinear Roman plan; some tombs and several mosaics have been discovered. Cremona became a free commune in the 11th century and in 1334 passed to the Viscontis. The most notable medieval buildings are grouped around Piazza del Comune. The Church of S. Michele (rebuilt in the 12th cent.) has a simple but elegant façade and remains of 14th-century frescoes. The Cathedral was rebuilt in the 12th century on a basilican plan. The subsequent addition of the transept transformed the plan to a Latin cross. There are sculptures of the school of Wiligelmo da Modena and statues attributed to Gano da Siena (14th cent.). In the interior are frescoes by B. Boccaccino, Altobello Meloni, Il Romanino, Pordenone (IX, PL. 302), and Antonio and Bernardino Campi. Next to the Cathedral is the Torrazzo, a campanile which has become the symbol of the city; it was begun in 1250 and topped by a pinnacle in 1284, making it the highest campanile in Italy (ca. 365 ft. high). The loggia at its base dates from 1515. The octagonal Romanesque Baptistery was remodeled in the 15th century. In the same square are situated the Palazzo del Comune (1206–46; since remodeled) and the Loggia dei Militi (1292). The Palazzo del Popolo is of the 13th century. Two notable Gothic churches are S. Agostino (14th cent.), which preserves a painting by Perugino in its 16th-century interior, and S. Luca, remodeled in the 15th century. The Renaissance Portico della Bertazzola was begun by L. Trotti in 1499 and contains the tomb of Folchino Schizzi by Bonino da Campione. Sixteenth-century architecture is represented by S. Margherita (1547; built and frescoed by G. Campi), S. Pietro al Po (1563), the Palazzo Fodri, and the Palazzo Affaitati Magio. The Palazzo Stanga (1768) and Palazzo Tinti are rococo. The Palazzo Barbò is neoclassic. The Museo "Ala Ponzone" in Palazzo Affaitati Magio contains Cremonese paintings and an archaeological collection.

Near Cremona are the Church of S. Sigismondo, frescoed by 16th-century painters from Cremona, and the Church of S. Vincenzo, 17th century, which preserves a 12th-century apse from the original building.

Galliano. This was the site of a Roman *vicus* whose inhabitants probably were called "Braecorii Gallianates." The Basilica of S. Vincenzo, founded perhaps as early as the 5th century but reconstructed in 1007 by Aribertus of Intimiano, is located here; the exterior is simple and the interior consists of nave and one side aisle with a raised presbytery, perhaps later, and a crypt. The remarkable frescoes that decorate the nave, apse, and crypt represent a rare example of early 11th-century Lombard painting and show strong ties to Ottonian art. The Baptistery of S. Giovanni, perhaps mid-10th century, is square in plan with four hemicycles and an interior upper gallery, access to which is obtained through the west narthex; there is a circular font for baptism by immersion.

Gravedona. Situated on Lake Como, Gravedona became important in the 12th century, the period in which S. Maria del Tiglio was built. The church is Lombard Romanesque, with Burgundian influence, and was built on the site of an Early Christian baptistery; the simple interior (restored) has a single aisle and three apses. Beneath the floor are remains of the original basin for baptism by immersion. In the central apse is a wooden Romanesque crucifix. S. Vincenzo, an Early Christian church completely remodeled in the 17th–18th century, preserves part of the original crypt. SS. Gusmeo e Matteo, a 13th-century church (later remodeled), has frescoes by G. M. and G. B. Fiammenghino (1606). S. Maria delle Grazie (1467) has a Renaissance façade. The Palazzo Gallio was designed by P. Tibaldi (1586).

BIBLIOG. G. Rocco, Il palazzo delle quattro torri di Pellegrini a Gravedona, Como, 1929; U. Monneret de Villard, I monumenti del Lago di Como, Florence, 1932; M. Zecchinelli, Le tre pievi: Gravedona, Dongo, Lorico, con appendice sull'Abbazia di Piona, Milan, 1951.

Lodi. Frederick Barbarossa founded Lodi in 1158 after the destruction by the Milanese of its nearby predecessor, Laus Pompeia (now Lodi Vecchio). Lodi flourished during the late Middle Ages and the Renaissance. The Cathedral is a Romanesque structure (completed 1163) but has been extensively rebuilt; it has the original sculptured façade portal, preceded by a later porch with column-bearing lions taken from the Cathedral of Laus Pompeia. The unfinished campanile dates from the 16th century. S. Francesco (13th–14th cent.) has a brick façade, with a vestibule, a rose window, and

lancet windows; within are frescoes of the 14th–15th century. S. Agnese is a Lombard Gothic hall church. Ruins of the Broletto (1284) survive. The Church of the Incoronata (G. Battagio, 1488–89; G. G. Dolcebuono, 1494) has an octagonal interior with niches and windowed loggias and is covered by a segmented dome; within are 16th-century reliefs, four panels of the Life of the Virgin by Il Bergognone, and painted decoration by Callisto, Cesare, and Scipione Piazza (PL. 195). The Ospedale Maggiore, begun in 1459 and enlarged by P. Tibaldi (1571), has a small court decorated with terra cotta (1473) and a façade by G. Piermarini (1792). The Palazzo Veresi (formerly Mozzanica) is perhaps by Battagio. The Palazzo Barni is baroque, as is the Palazzo del Vescovo (1730; G. A. Veneroni). The Museo Civico contains archaeological material, a ceramic collection, and a painting gallery with works of local artists.

A few miles from Lodi is Lodi Vecchio (Lat., Laus Pompeia). The town was founded by the Boii, a Celtic tribe, and later became a Roman municipium. Destroyed in 1151, it grew up again as a village. The layout of the ancient Roman streets can still be seen, as well as part of the wall and perhaps the forum.

In the countryside is the Basilica of S. Bassiano, an Early Christian church rebuilt in the 10th and 14th centuries. The Gothic façade is divided into three parts by engaged columns; the interior consists of nave and two side aisles separated by piers and preserves 14th-century frescoes.

Across the Adda River from Lodi is Abbadia Cerreto. A Benedictine abbey existed there as early as 1084; it later subscribed to the Cistercian reform. Surviving is the Cistercian Church of S. Pietro (second half of 12th cent.; restored). An octagonal tower rises above the crossing (first half of the 14th cent.), and composite piers divide the nave from the two side aisles of the Romanesque structure. Ruins of the monastic buildings also survive.

Lomello (Lat., Laumellum). Originally a Celtic settlement, it became a Roman *vicus*. Later it was a Lombard center and retains walls from that period. The Baptistery of S. Giovanni ad Fontes dates from the 5th century; it was rebuilt in its upper parts in the 8th century and restored in 1940. It has alternating rectangular and horseshoe-shaped niches and an octagonal dome. Within are remains of a hexagonal baptismal basin. The 10th-century Church of S. Maria Maggiore was built by Bruningus on the site of a church contemporary with the Baptistery. The Castle has been rebuilt many times (1157, 1381, after 1407) and preserves two rooms with 16th-century frescoes.

BIBLIOG. RE, s.v. Laumellum; F. Reggiori, Dieci battisteri lombardi minori, Rome, 1935; G. Nigra, La basilica di S. Maria Maggiore di Lomello, Novara, 1936; G. Maria Maggiore di Lomello, Palladio, N.S., I, 1951, pp. 67–69.

Lovere. The city is situated at the northern end of Lake Iseo and preserves gold- and silverwork from a necropolis of the Gallic and Roman periods. The Church of S. Maria in Valvendra was built by Lombard masters (1473–83), but the interior was remodeled during the baroque period (1647 and 1751). The Galleria dell'Accademia Tadini (19th cent.; S. Salimbeni) has a noteworthy collection of paintings and porcelain.

About nine miles from Lovere is Clusone. The Oratorio dei Disciplini (1450) has a frescoed façade (*Triumph of Death* and *Dance of Death*, 1485); within are frescoes of the Life of Christ (1471). The Church of S. Maria Assunta (17th cent.) has a portico at one side and preserves 17th-century sculpture and carving by A. Fantoni, as well as paintings of the Venetian school.

Olmo, Memorie storiche di Clusone e della valle seriana superiore, Bergamo, 1906.

Luino. Situated on the east bank of Lake Maggiore at the mouth of the Tresa River. The Church of the Madonna del Carmine (15th cent.) preserves a porch, sculptured portal, terra-cotta Madonna and Child in the lunette, and frescoed chapel (1540; school of G. Ferrari). The Oratory of S. Pietro was rebuilt in the 17th and 18th centuries and has a Romanesque campanile. The Church of S. Giuseppe dates from the 18th century, as does the Palazzo del Municipio (F. Soave).

BIBLIOG. M. Sanvito, Luino nella storia e nell'arte, Varese, 1931.

Mantua (It., Mantova). Situated in a bend of the Mincio River, the city is surrounded on three sides by water. Mantua may have been founded by the Etruscans, who probably occupied it until a very late date, and it also seems to have been a center of the Cenomani. In Roman times part of the territory was portioned out to military veterans. The neighboring Roman village of Andes is famous as the birthplace of Vergil. Mantua flourished during the Middle Ages, first as a free commune (12th–13th cent.) and from 1273 under the Bonacolsi family. The Gonzagas ruled from 1328 to 1707 and gave the city its present appearance. (In the 16th century Giulio Romano undertook a complete urban renovation.) The Romanesque Rotonda di S. Lorenzo (late 11th cent.; restored) has a hemispherical dome without a drum. S. Maria di Gradaro (13th cent.) is a monastic church of Romanesque-Gothic transitional style. The 13th-century battlemented palaces and towers of Piazza Sordello give it a medieval character (Acerbi houses, Palazzo Bonacolsi with a tower of 1303, Torre della Gabbia). The Broletto, a civil edifice of the communal period (1227–73), also has battlements and a high corner tower; on the façade (remodeled in the 15th cent.) is a statue of Vergil (13th cent.). The Palazzo della Ragione dates from 1250. S. Francesco (restored 1952), a Gothic modification of an earlier, Romanesque oratory, has a brick façade and an impressive portal; within are 13th–14th-century frescoes. The Palazzo Ducale consists of a group of buildings erected and transformed between 1290 and 1707. The Castello di S. Giorgio is a part of this complex. The nucleus of the Palazzo Ducale is formed of two palaces built by the Bonacolsi family (13th–14th cent.): the Palazzo del Capitano and the Magna Domus. The former preserves remains of 14th-century decoration. The Magna Domus was gradually expanded from the 14th through the 18th century. In the 14th century, Bartolino da Novara worked on the Castello di S. Giorgio (1380), followed, in the 15th century, by L. Fancelli, who may have constructed the courtyard of the Castello and the apartments of Eleonora de' Medici. In the 16th century, A. M. Viani built the Galleria Nuova and the Appartamento Ducale. Giulio Romano worked on the Appartamento Estivale and the Cortile della Cavallerizza (the latter completed by G. B. Bertani). P. Pozzo redesigned the Appartamento degli Arazzi in the 18th century. The interiors are richly decorated with stuccoes, frescoes, and wood carving; the stuccowork in the Stanza di Apollo is attributed to F. Primaticcio, who may also have painted the frescoes in the Sala di Manto. The *studiolo* of Isabella d'Este has a carved ceiling designed by the Mola brothers. There are numerous frescoes by Giulio Romano and his pupils, and Mantegna (q.v.) frescoed the Camera degli Sposi (IX, PLS. 328, 329).

Luca Fancelli built S. Sebastiano (1460; restored; I, PL. 56), after a design L. B. Alberti (q.v.). S. Andrea (1472–94) was also built by Fancelli, after a design by Alberti (1470; I, PLS. 57, 58). The choir and transept are the work of A. M. Viani (ca. 1500), and the dome was designed by F. Juvara. The campanile is Gothic (1413). Giulio Romano built the Palazzo del Te (PL. 428) and also frescoed the Sala di Psiche; several artists worked on the decoration of the palace, including Primaticcio (stucco frieze in the Sala degli Stucchi), Polidoro da Caravaggio (Saletta dei Grotteschi), Giovanni da Udine (Saletta della Cupola Ottagona), and Rinaldo Mantovano (Sala dei Giganti; IX, PL. 298). The medieval Cathedral was remodeled in 1545 but retains a Romanesque campanile and some Gothic work. There are 14th-century frescoes and, in the apse and choir, frescoes by D. Fetti. Bertani designed the Church of S. Barbara (1562–65). Surviving 15th-century palaces include the house of Mantegna, perhaps designed by the artist himself; the Università dei Mercanti, with remains of frescoes by Pordenone on the façade; and the Palazzo Andreasi. Surviving 16th-century structures include the house of Giulio Romano, designed by the artist (1544), and the Palazzo Guerrieri, rebuilt in the 16th century but retaining the medieval Torre della Gabbia. The Palazzo Canossa dates from the 17th century. The Palazzo dell'Accademia Virgiliana has a neoclassic façade by G. Piermarini (1773). Inside is the Teatro Scientifico by A. Galli Bibiena (PL. 106). The Teatro Sociale by L. Canonica is a 19th-century design. The Galleria e Museo di Palazzo Ducale contains a picture gallery with tapestries made from Raphael cartoons, and canvases by Rubens, D. Fetti (II, PL. 202), and others; Greek and Roman sculpture; medieval and 13th–18th century sculpture; Egyptian art.

Milan (Lat., Mediolanum). Although Milan is a markedly modern city, it preserves important artistic monuments from several periods. Founded by the Insubrians in the early 4th century B.C., it became subject to Rome in 196 B.C. Milan was a municipium and then a colony, under Hadrian; it achieved great importance toward the end of the 3d century as the capital of the Roman Empire. Remains of the Roman period include 16 Corinthian columns (perhaps from a temple) that were assembled as the front colonnade of the atrium which stood before the Church of S. Lorenzo, and the great 24-sided tower of the city wall of Maxentius. There are also remains of a theater (Augustan age), a thermal establishment (Via Brisa, perhaps Constantinian), one of the towers of the *carceres* of the circus, a tower of the Porta Ticinese, stretches of the wall around the circus and of an octagonal wall built around S. Vittore al Corpo, where an octagonal mausoleum once stood. Ruins of the Augustan city wall and of Maximian's additions to it, the amphitheater, a porticoed street (perhaps 2d cent.), another thermal building (perhaps the Baths of Hercules), and less important civil and religious buildings have been discovered. The sites of the forum, mint, and imperial palace are also known.

Several Early Christian basilicas are extant. Those built before S. Ambrogio (end of 4th cent.) are S. Tecla (only foundations remain), S. Giovanni in Conca (parts), and the Chapel of S. Vittore in Ciel d'Oro (later incorporated within S. Ambrogio). In the time of St. Ambrose, several basilicas were erected: Martyrum (S. Ambrogio), Apostolorum (S. Nazaro Maggiore), Salvatoris (S. Dionigi), and Virginum (S. Simpliciano, the best preserved). The central-plan Church of S. Lorenzo Maggiore may not have been built until the early 5th century. Some Early Christian monuments have been destroyed (e.g., S. Tecla); others have been much changed through the centuries, although their original structures have been identified (e.g., S. Ambrogio, S. Nazaro Maggiore, S. Lorenzo Maggiore, S. Simpliciano). These buildings represent the architectural development of late antiquity and the Early Christian period. S. Lorenzo, which was rebuilt in 1573 by M. Bassi, preserves the original quatrefoil plan. The three annexed chapels of S. Ippolito, S. Sisto, and S. Aquilino radiate from the central core. S. Aquilino preserves important mosaics (4th–5th cent.). The mosaics in S. Vittore in Ciel d'Oro (in S. Ambrogio) are later and reveal Byzantine influence.

Milan was destroyed by the Goths in the 6th century but was rebuilt in the pre-Romanesque period, when the building activity of the Lombard craftsman known as the *magistri comacini* began. The apse of S. Ambrogio was built in the 8th century, and those of S. Vincenzo in Prato and S. Eustorgio date from the 9th century. Early Romanesque structures include the Chapel of the Pietà (S. Maria presso S. Satiro) and the churches of S. Babila (I, PL. 394) and S. Celso; all have been remodeled but preserve Romanesque elements. A high point of medieval architecture was marked by the reconstruction of S. Ambrogio, a basilica of imposing size with an atrium; the use of cross vaults with flat ribs supported by cruciform piers was a development of far-reaching importance (I, PL. 384). Also of the 9th century is the golden altar of S. Ambrogio (III, PL. 63). In 1162 Frederick Barbarossa devastated the city, but it was rebuilt (this time as a free commune) with a new fortifying wall. Churches rebuilt at this time include S. Eufemia, S. Calimero, and S. Eustorgio, all of which followed the building principles of S. Ambrogio. In the early 13th century the Palazzo della Ragione (or Broletto Nuovo) was built. It preserves a façade relief of the podesta Oldrado da Tresseno; the work of a local master, this equestrian sculpture reveals the influence of Benedetto Antelami.

Building activity continued under the rule of the Viscontis, when Gothic style had its effects on local work, but Milanese masters were reluctant to abandon completely their traditions in favor of the new style. This is particularly evident in the Gothic Loggia degli Osii, which is adorned with Campionese sculptures that are rather heavy and ponderous in their modeling (III, PL. 21). The work of the Pisan sculptor and architect Giovanni di Balduccio brought fresh influences to Milan (e.g., tomb of St. Peter Martyr, in S. Eustorgio; VI, PL. 367). The Gothic monument par excellence in Milan is the Cathedral (begun 1386), which was built on the site of the former Church of S. Maria Maggiore and became the central focus of the city; it is related to northern Gothic through the influence of successive French and German masters among the directors of the work. It reveals a taste for excessive ornament (evident also in Lombard Renaissance architecture), on the exterior, which is adorned with a great number of pinnacles (VI, PL. 337), and in the interior, particularly in the richly decorated capitals conceived by Giovannino de' Grassi. The polygonal apse is extremely graceful, but the façade is somewhat inconsistent, having been completed only in the 19th century. Among the treasures within are the Aribertus Cross, the Trivulzio Candelabrum, and Campionese sculptures of apostles (III, PL. 18).

The reign of the Sforza family, particularly that of Ludovico (Il Moro; 1451–1508), was a fruitful period for Milan's architecture. The Castello Sforzesco, a huge brick structure with a square plan and towers at the corners, was begun by Giovanni da Milano (1450) and successively worked on by Filarete and Bartolomeo Gadio. The structure was almost complete when Francesco Sforza died (1466); and was completed and decorated under Galeazzo Maria and Lodovico. The tower at the main gate was built by Filarete; destroyed in 1521, it was reconstructed by Beltrami at the end of the 19th century. The Ponticella of Lodovico, a small complex of loggia and private apartments over the moat, is attributed to Bramante. The Renaissance Portico of the Elephant and the Loggia of Galeazzo Maria (B. Ferrini) are in the ducal court; the portico in the Cortile della Rocchetta is by B. Ferrini (east side attributed to Bramante). The Sala delle Asse has frescoes designed and possibly painted by Leonardo da Vinci (q.v.). The chapel was frescoed by Bonifacio Bembo. The Sala del Tesoro has a fresco by Bramantino. The Ospedale Maggiore (Albergo de' Poveri), a Renaissance building with Gothic elements, was restored after World War II. Filarete began the structure in 1456 with the south wing; F. M. Ricchino, G. B. Pessina, F. Mangone, and Cerano were responsible for the central part with the great courtyard and the church (1625–49), and F. Castelli built the neoclassic north wing (1798–1804). The Portinari Chapel in S. Eustorgio, by Filarete and Ferrini, represents a fusion of Lombard elements with the style of Michelozzo. It is frescoed with scenes from the life of St. Peter by V. Foppa (V, PL. 358). S. Maria presso S. Satiro (1483; Bramante; façade by G. Vandoni, 1871) consists of a nave and two aisles covered with a barrel vault and a hemispherical dome; the simulated apse consists of three niches and a coffered vault, all in illusionistic perspective in stucco (II, PLS. 338–40, 344). The octagonal sacristy (or baptistery) has polychrome terra-cotta decoration by Agostino dei Fonduti. S. Maria delle Grazie was partly built by G. Solari (façade, nave and two aisles with Gothic arches and cross vaults, 1466–90) and partly by Bramante (II, PLS. 341, 342; trefoil choir with dome and external loggias begun in 1492; cloister and Old Sacristy). The Church was restored in 1934–37 and again in 1947; Solari's large cloister was completely destroyed in 1943. There are frescoes of Dominican saints by B. Butinone (1482?), scenes from the life of Christ by G. Ferrari (ca. 1540), and the famous *Last Supper* by Leonardo da Vinci (IX, PL. 125). The Church also preserves a Crucifixion by Donato da Montorfano (1495). S. Pietro in Gessate was built in 1460, perhaps by Solari, and contains frescoes by Il Bergognone, B. Zenale, B. Butinone, and A. Campi. S. Bernardino alle Monache was built about 1428. S. Maria della Pace (1466–97; G. Solari) preserves frescoes by Tanzio da Varallo. S. Maria del Carmine (1446–49) was remodeled in the 19th century (façade, 1880). S. Maria Incoronata consists of two churches side by side (1451 and 1460) in the style of the Solari family. S. Maria della Passione was built by G. Battagio (1482–85) and transformed in the 16th century, with a dome by Cristoforo Lombardo (1530) and a baroque façade. G. G. Dolcebuono, Cristoforo Solari, and G. A. Amadeo began S. Maria presso S. Celso in 1493–97; it was completed in the 16th century by C. Cesariano, C. Lombardo, V. Seregni, and G. Alessi. The Portico della Canonica (1492–99) of S. Ambrogio is by Bramante, as are the two cloisters (now courtyards of the Università Cattolica del Sacro Cuore), which were part of a larger project by the architect (II, PL. 345). The Cascina Pozzobonelli is a triapsidal oratory (1498) with a polygonal cupola. The Trivulzio Chapel is by Bramantino (1512) and serves as the vestibule of S. Nazaro Maggiore. The chapel contains the tomb of Gian Giacomo Trivulzio by F. Briosco. The Chapel of S. Maria alla Fontana (under the church of the same name) was begun in 1507; formerly attributed to Leonardo, it is now believed to be the work of anonymous followers of Bramante.

Fifteenth-century secular architecture includes the Casa Fontana (now Silvestri), the Bicocca degli Arcimboldi, Casa Atellani (now Conti), the Casa dei Panigarola, the Bramantesque portal and courtyard of the Palazzo Castani, and the courtyard of the Casa dei Grifi. The Casa dei Borromei was severely damaged in World War II. It has been restored and preserves frescoes, in the International Gothic style, depicting aristocrats at play (VI, PL. 6).

In the 16th century G. Alessi built the Palazzo Marino, Palazzo Municipale (1553–58, restored), the Church of SS. Paolo e Barnaba (1560), and the façade of S. Maria presso S. Celso (1565). Pellegrino Tibaldi worked on the Palazzo Arcivescovile, where he built the

chapel and the portal and courtyard of the presbytery (1572–1604). Tibaldi also designed the churches of S. Fidele (begun 1569, completed by M. Bassi and F. M. Ricchino), S. Carlo al Lazzaretto, and S. Sebastiano (1577; remodeled by M. Bassi, F. Mangone, and G. Meda). The Casa degli Omenoni ("the house of the big men") by L. Leoni (1573) has eight large telamones by A. Abbondio, from which the building derives its name. V. Seregni built the Palazzo dei Giureconsulti (1562) and designed the interior of the Certosa di Milano a Garegnano, which preserves a fresco cycle by Daniele Crespi (1629). The Church of S. Maurizio al Monastero Maggiore (1503–81) was decorated within by B. Luini, S. Peterzano, A. Campi, and G. P. Lomazzo. The architecture and decoration of S. Angelo (1552–84) are late mannerist in style.

Fabio Mangone and Francesco Maria Ricchino were the two principal architects of the baroque period. Mangone built the Palazzo del Senato (designed as the Collegio Elvetico), altered S. Sebastiano (1617), remodeled S. Maria Podone (1625), and completed the Seminario Maggiore (1608; begun by A. Trezzi before 1602). Ricchino was responsible for the Scurolo di S. Carlo in the crypt of the Cathedral (1606), the incurving façade of the Palazzo del Senato (1627), the Church of S. Giuseppe (1607–30), the Palazzo Annoni (now Cicogna; 1631), Palazzo Durini (1644–45), and Palazzo Litta (1648; staircase by C. G. Merli, 1690; façade by B. Bolli, 1752–63; PL. 226), the facing and courtyard of the Palazzo di Brera (1651; II, PL. 145), the Church of S. Maria alla Porta (1650), and the entrance portal (1644) of the Seminario Vescovile. Girolamo Quadrio built the campanile (begun by C. Buzzi) of S. Stefano Maggiore, the Arese Chapel in S. Vittore al Corpo, the Chapel of the Madonna del Carmine (1616–76) in S. Maria del Carmine, and the Church of S. Nicolao (1659). S. Alessandro in Zebedia (1602–60) was constructed on a plan by L. Binaghi (Binago) under the successive guidance of Ricchino, G. Quadrio, and V. Castelli.

Important rococo works were created during the period of Austrian domination (18th cent.), particularly in civil architecture: S. Maria della Sanità (1708; C. Pietrasanta), S. Francesco di Paola (1728; M. Bianchi), the Palazzo Cusani (1719) and the Palazzo Trivulzio (1707–13), both by C. Ruggeri, and the Palazzo Sormani-Andreani (1736; F. Croce; restored). G. B. Tiepolo painted an immense fresco, depicting the chariot of the sun, in the Palazzo Clerici; he also painted frescoes in the Palazzo Dugnani (allegorical subjects and scenes of the lives of Scipio and Massinissa; VII, PL. 269). Under Napoleon, Milan received its first regulated urban plans (1801–07). Thus was established the basis of the modern city, which spread beyond the old walls and became one of the most representative centers of neoclassicism. G. Piermarini built the Palazzo Belgioioso (1777; frescoes by M. Knoller), the Palazzo Greppi in Via S. Antonio (1776; interior decoration by G. Albertolli and Knoller), the public gardens (1782; enlarged in the 19th cent.), the façade of the Royal Palace (1770–78), and the Teatro alla Scala (1776–78). B. Alfieri designed the inner façade of Palazzo Sormani-Andreani (1756). The Villa Reale was built by L. Pollack (1790–96); the Palazzo Serbelloni is by S. Cantone (1794; X, PL. 267). Of the projected Foro Buonaparte near the Castello Sforzesco, only the Arco della Pace (1807–38) by L. Cagnola and the Arena (1805–07) by L. Canonica were erected. The Gothic revival resulted in the completion of the façade of the Cathedral (1805–13) by C. Amati, who also built S. Carlo (1832–47). The eclecticism of the second half of the 19th century is represented by the Cimitero Monumentale (1866; C. Maciachini); there are monuments by Medardo Rosso, Vincenzo Vela, Giuseppe Grandi, Adolph Wildt, and others. The most representative personality of this period is G. Mengoni, who built the Galleria Vittorio Emanuele II (1865–77) and redesigned the Piazza del Duomo. The Palazzo Castiglioni was built in 1903 by G. Sommaruga in Art Nouveau style. The Stazione Centrale, designed by U. Stacchini, was erected in 1906–31.

Since the end of the 19th century Milan has undergone a series of noteworthy urban expansions: 1884–89, 1912, 1934, 1953. Noteworthy among building and reconstruction projects carried out after World War II are new apartment houses in Via Italia and Via Corridoni (L. Moretti); the Mangiagalli quarter (F. Albini and I. Gardella); the new business district (known as the Centro Direzionale), with the Palazzo Lane Rossi (1953; Chiolini and Brandolini) and the Palazzo S.I.R.T.I. (1954; G. Valtolina and others); the T.8 District, an experimental complex of structures, by Italian and foreign architects, built on the occasion of the 8th Triennale of Milan (from which it derives its name; 1947) under the general direction of the architect P. Bottoni. Skyscrapers have also begun to appear, including the Centro Svizzero (1953; A. Meili) in Piazza Cavour; the Grattacielo di Milano (1955; the Soncini brothers, L. Mattioni, and P. Portaluppi) in Piazza della Repubblica; the skyscraper designed by Baciocchi (1938); the Pirelli building (G. Ponti and G. Valtolina); and the Vespa building (1955) by L. Vietti.

Milan is especially noteworthy for its excellent museums. The Pinacoteca di Brera has a fine collection of 15th–18th-century Lombard and Venetian art. The Museo Poldi Pezzoli has Lombard, Tuscan, and Venetian painting, of the 15th–18th century, as well as a collection of arms, archaeological material, and furnishings. The Museo del Castello Sforzesco was redesigned in the 20th century by the architects Belgioioso, Peressutti, and Rogers and is a noteworthy example of a modern museum designed within an old building. The sculpture collection includes late Roman, Byzantine, Gothic, and Renaissance works; the museum also contains furniture and paintings. The Pinacoteca Ambrosiana has a famous collection of drawings; the paintings are chiefly of the Lombard and Venetian schools. Other museums include the Museo Sacro di S. Ambrogio, the Museo del Duomo, and the Galleria d'Arte Moderna. The Museo Teatrale alla Scala has a collection of archaeological material, as does the Museo Archeologico.

Near Milan are two important abbeys: Chiaravalle and Viboldone. The former, founded by Cistercians in 1135, preserves its brick church (VI, PL. 331), a structure combining Lombard and Cistercian-Gothic elements. A very tall polygonal tower (14th cent.) surmounts the church. Within, the nave is divided from the two side aisles by short cylindrical pillars. The Abbey of Viboldone was begun by the Humiliati in the 12th century; construction continued throughout the 13th century, and the structure was completed in the 14th. Consequently the church has both Romanesque and Gothic structural elements. The brick Lombard façade is tripartite, divided by engaged columns; over the portal is a marble lunette sculptured by an anonymous artist. The spired companile is of the 13th century, and inside the church is a cycle of Giottesque frescoes (PL. 188).

Monza (Lat., Modicia). An Insubrian settlement and then a Roman site, it became the residence of veterans returned from Mogontiacum (mod. Mainz). Monza became an important center under the Lombards (6th cent.); it was a free commune for a short period and came under the domination of the Viscontis in 1324. Bronze Age remains have been found, as well as several Roman tombs. The Cathedral was erected in the late 6th century but was entirely rebuilt in Gothic style in the 13th–14th century. The campanile is by P. Tibaldi (1592–1606); the bichrome marble façade, which shows Tuscan influence, is by Matteo da Campione (1390–96). The interior (remodeled in the 17th and 18th cent.) contains Campionese sculpture in the organ gallery; the main altar in marble and bronze is by A. Appiani (1798); there is a gilded silver repoussé altar frontal by Borgino dal Pozzo (1350–57). The Chapel of Queen Theodalinda is frescoed with scenes from the life of the queen by the Zavattari family (1444); the same chapel preserves the famous "iron crown" (VI, PL. 260). The Cathedral Treasury contains valuable relics of the 5th–9th centuries (IX, PL. 163). The Arengario (or Palazzo del Comune, 1293) was built in imitation of the Palazzo della Ragione in Milan and has an external loggia, where decrees were read to the populace. S. Maria in Strada was erected by Ambrogio da Milano (1357; remodeled). S. Maria delle Grazie is a late Gothic structure (1473; remodeled). The Villa Reale, a typical example of a neoclassic country house (1777–80; G. Piermarini) is a complex of buildings (including a rotunda in the park and the Cappella Espiatoria) with neoclassic decoration by G. Albertolli, A. Sanquirico, G. Traballesi, and A. Appiani; the park is by L. Canonica and Giacomo Tazzini (1806). The Villa Reale houses the Pinacoteca Civica and the Museo Storico.

North of Monza is Agliate, whose Church of S. Pietro dates from the 10th–11th century (restored in late 19th cent.). It is a timber-roofed structure with nave and two aisles divided by ancient columns with octagonal capitals. There are remains of 12th-century frescoes. The adjacent polygonal baptistery is contemporaneous with the basilica and has remains of frescoes and of the baptismal basin.

Pavia (Lat., Ticinum). The city was probably founded by the Ligurians or by an Insubrian tribe. In the beginning of the 2d century B.C. it was annexed by the Romans; it became an important center when the Via Aemilia was extended beyond the Po River. The Roman street plan is well preserved, and the first city wall has been identified (perhaps dating to the 1st century B.C. but strengthened and enlarged in the late Empire), along with the gates, one of which, probably Augustan, stood near the Palace of Theodoric. In the Middle Ages Pavia was the capital of the Lombard kings (6th–8th cent.), a commune (12th–13th cent.), and, from 1359, part of the Duchy of Milan. Medieval Pavia saw much building activity, but the Roman city plan with rectilinear intersections was respected. Many medieval towers survive, all made of brick, a material that has come to be a distinctive characteristic of the city's architecture.

Of the numerous Lombard monasteries which existed there, some traces of the original Lombard structure of the Church of S. Felice remain; the others were almost entirely rebuilt during the great architectural activity of the Romanesque period. The rebuilding of S. Michele was begun in 1117, and the church was consecrated in 1155; the sandstone façade is decorated with horizontal bands of low reliefs of fantastic figures. The interior has a Latin-cross plan with galleries, compound piers and richly carved capitals, and a vaulted ceiling. There is an octagonal crossing dome, a raised choir, and a crypt. There is a silver repoussé crucifix of the 12th century in one of the chapels. S. Pietro in Ciel d'Oro was reconstructed in the 12th century (restored by A. Savoldi, 1875–99) and follows the style of S. Michele in its façade. The façade of S. Pietro in Ciel d'Oro is richer in effects of color because brick and sandstone are used together with decorative majolica tiles. Above the main altar is the tomb of St. Augustine (1360), one of the finest examples of local Gothic sculpture, showing the influence of the Tuscan Giovanni di Balduccio. S. Teodoro (13th cent.; restored 1904–06) is a brick structure and preserves important frescoes of the 13th–14th century. S. Maria in Betlemme is also a 13th-century structure. Other Romanesque monuments include the Broletto, a 12th-century edifice with 13th-century additions and a loggia of 1563 (restored 1927); the Torre Civica (to which P. Tibaldi added the bell chamber, 1683); the remains of S. Stefano (13th cent.); and the former Palazzo Belcredi (remodeled in 14th and 15th cent.).

The Gothic period produced fewer buildings. S. Francesco (1230–98) is in the Romanesque-Gothic transitional style, and S. Maria del Carmine was begun in 1390. Particularly noteworthy is the Castello Visconteo, an impressive square structure with four towers (two destroyed) and a large courtyard. The Cathedral (1488), a notable product of the Lombard Renaissance, was designed by C. de' Rocchi, G. A. Amadeo, and G. G. Dolcebuono; Bramante designed the interior (not completed until 1884), with high nave and two side aisles and the large dome (II, PL. 343). The polygonal-plan sacristy in the crypt with an umbrella vault was also designed by Bramante (II, PL. 344). The façade was completed only in 1898. S. Maria di Canepanova by G. A. Amadeo is a central-plan church and has frescoes and canvases by C. Moncalvo and G. C. and C. Procaccini. Other Renaissance buildings include the Palazzo Bottigella (now the Convitto Gandini), with a courtyard by G. A. Amadeo; the Palazzo Cavagna, with elegant brick decoration; and the tower of the palace of Cristoforo Bottigella. The Palazzo Vescovile is a late Renaissance structure (1560–91). The Collegio Borromeo (1564; P. Tibaldi) is an example of Lombard mannerist architecture; it was partly remodeled in the 18th century by G. Veneroni. S. Maria delle Grazie (G. B. Tassinari, 1609) is a baroque structure, and the Palazzo Municipale (formerly Palazzo Mezzabarba, by Veneroni, 1728–30) is rococo. The old parts of the university date from the 15th century but underwent major changes in the 18th (G. Piermarini) and 19th centuries (L. Pollack).

The Museo del Castello, in the Castello Visconteo, contains medieval sculpture and archaeological material. The Pinacoteca Malaspina has a collection of paintings. The Museo della Certosa, in the Palazzo Ducale, has documents relative to the Certosa and a collection of Renaissance paintings and sculpture.

On the road to Milan is the Certosa of Pavia, the famous Carthusian monastery founded in 1396 by Gian Galeazzo Visconti. The church, designed by Giovanni and Guiniforte Solari, is preceded by a large courtyard, access to which is gained through a vestibule decorated with 16th-century frescoes; on the south side of the courtyard is the baroque Foresteria (pilgrim's hospice; F. M. Ricchino). The façade of the church was begun by Giovanni Solari (1473) and decorated by Antonio and Cristoforo Mantegazza, G. A. Amadeo (1473–99), and C. Lombardo (16th cent.). The façade is adorned with polychrome marble and sculptures (PL. 195). The façade portal may have been designed by Gian Cristoforo Romano and is decorated with reliefs by B. Briosco. The interior has both Gothic and Renaissance elements and consists of a nave and two aisles separated by piers and flanked by cross-vaulted chapels containing many works of art. Flanking the presbytery are the lavabo and the old sacristy, with a large ivory triptych of scenes from the life of the Virgin and depictions of saints by Baldassare degli Embriachi (1400–09; PL. 245). The small cloister has a portal signed by G. A. Amadeo (1466). The large cloister has terra-cotta decoration.

Not far from Pavia, in San Lanfranco, is the Church of S. Salvatore. It was built in the 7th century, enlarged in the 10th with a Benedictine monastery annexed, and rebuilt in the 15th–16th in Renaissance style with some Gothic elements.

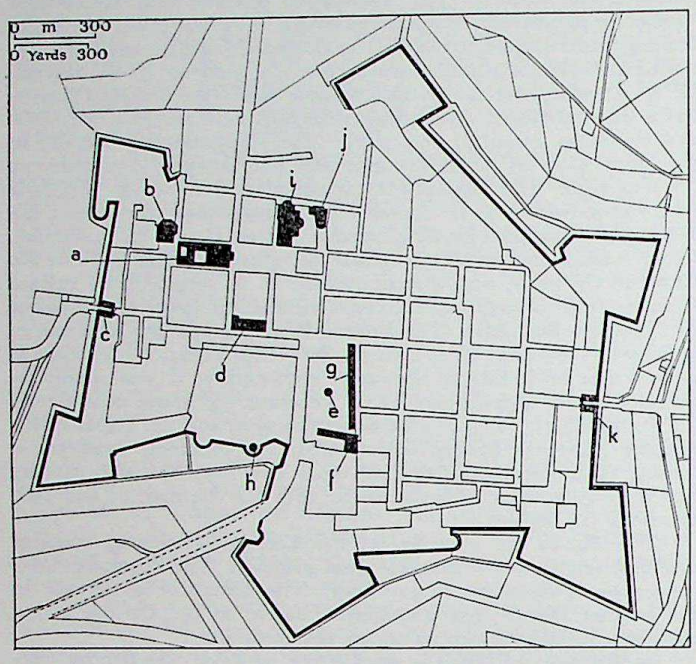
Sabbioneta. In 1446 Sabbioneta was taken over by a minor branch of the Gonzaga family. By order of Vespasiano Gonzaga, Sabbioneta was rebuilt in the 16th century on a rectilinear plan. The same prince commissioned the fortifying wall, built by G. Cataneo of Novara, and oversaw the construction of numerous buildings, many of which are still standing and represent a unified complex



Sabbioneta, plan. Principal monuments: (*a*) Palazzo Ducale; (*b*) Church of the Incoronata; (*c*) Porta della Vittoria; (*d*) Teatro Olimpico; (*e*) Column of Pallas; (*f*) Palazzo del Giardino; (*g*) Galleria delle Antichità; (*h*) ruins of the Gonzaga castle; (*i*) S. Maria Assunta; (*j*) S. Rocco; (*k*) Porta Imperiale.

of 16th-century architecture. The Palazzo Ducale (1560) may have been designed by Vespasiano Gonzaga himself. The Palazzo del Giardino (1580–84) is decorated with frescoes, stuccowork, and grotesques by B. Campi, Giulio Romano, A. Cavalli, and Fornarotto of Mantua. Next to the Palazzo del Giardino is the Galleria delle Antichità (1584), frescoed by the Pesentis. The parish church (S. Maria Assunta; 1581) is by P. M. Pesenti; the 18th-century Chapel of the Sacred Heart has a dome by F. Galli Bibiena. The Church of the Incoronata (1586) contains the tomb of Vespasiano Gonzaga, by G. B. della Porta, and a bronze statue of the prince by L. Leoni (1588). The Teatro Olimpico (1589; V. Scamozzi) is built on a rectangular plan with semicircular stepped seats and loggia; there are frescoes of the school of Paolo Veronese.

Bibliog. G. F. Marini, Sabbioneta: piccola Atene, Casalmaggiore, 1914; T. Buzzi, Il palazzo ducale di Sabbioneta, Dedalo, IX, 1928–29, pp. 221–52, X, 1929–30, pp. 272–301; A. Puerari, Sabbioneta, Milan, 1955; G. Sena Chiesa, Guida da Sabbioneta, Milan, 1957.

Saronno. The town is famous as the site of the Sanctuary of the Madonna dei Miracoli. The sanctuary was begun in 1498, perhaps by G. A. Amadeo, with a square plan and a polygonal dome. The church was added later. The façade, by P. Tibaldi (1596–1612), has a double order of paired columns. The interior was designed by V. Dell'Orto and has baroque decorations. The campanile is by P. Della Porta (1516). Fresco decoration includes a concert of angels by Gaudenzio Ferrari (1536). There are also frescoes by B. Luini (1524–25).

Bibliog. F. Malaguzzi Valeri, Gli affreschi della Cupola di Saronno, Rass. d'arte, IV, 1904, pp. 69–73; G. Moretti, Il Santuario di Saronno, Rass. d'arte, IV, 1904, pp. 73–75; P. M. Sevesi, Il Santuario di Saronno, Milan, 1926.

Sirmione (Lat., Sirmio). The town is situated on a peninsula at the southern end of Lake Garda. At the extreme end of the peninsula are remains of a Roman villa improperly called the "Grotte di Catullo." It has been dated to the 1st century of the Christian Era, although some remains may date to the 1st century B.C. Sirmione also enjoyed a certain importance under the Lombards and the Franks. Ansa, the wife of Desiderius (king of the Lombards, 756–74), founded a monastery, of which some ruins are extant. The 11th-century Church of S. Pietro in Mavino was enlarged in the 14th century and preserves 12th–16th-century frescoes superimposed one upon another. In the 13th century, control of the city passed to the Scaliger family, who fortified it with a surrounding wall and built the Rocca Scaligera (1259), a high keep entirely surrounded by water. The Scaligers also fortified Porto Vecchio with a battlemented wall. The Antiquarium delle Grotte di Catullo contains material from the Roman villa.

Mirabella Roberti, Sirmione: Les grottes de Catulle, Trieste, 1959; L. Costanza Fattori, Cappella di S. Anna, Arte lombarda, V, 2, 1960, pp. 259–61.

Sondrio. There is no documentation of the existence of Sondrio before A.D. 1000. From 1336 until the beginning of the 16th century, it belonged to the Duchy of Milan; then it belonged to the Grigioni family until 1797, when it was included in the Cisalpine Republic. Sondrio boasts several noteworthy palaces, including the Renaissance Palazzo Pretorio, the Palazzo Sassi de Lavizzari (16th cent.), the Palazzo Sertoli (18th cent.), which has frescoes attributed to G. Coduri, the Palazzo Carbonera with a spiral staircase and ironwork balconies, and the 20th-century Palazzo del Governo, by G. Muzio, with paintings by G. F. Usellini. The most distinguished monument is the collegiate church (SS. Gervagio e Protasio), designed by G. P. Ligari (18th cent.), with a façade by G. Sertoli (1838); in the interior are paintings by P. Ligari (1738) and 18th-century carved wooden choir stalls. The Teatro Sociale is by L. Canonica (1820). The Palazzo Quadrio-Tua houses the Museo Valtellinese, which has a collection of works of local artists.

Bibliog. Inventario degli oggetti d'antichità e d'arte d'Italia, IX, Provincia di Sondrio, Rome, 1938; Piccola guida turistica della Provincia di Sondrio, Varese, n.d.

Varese. Near the site of modern Varese were prehistoric lake-village settlements. During the Middle Ages Varese was a fortified site. For the most part, Varese is a modern center. The Baptistery dates from the late 12th or early 13th century and was built over an earlier hexagonal baptistery (8th–9th cent.); in the interior is an octagonal baptismal basin (late 13th cent.) and 14th-century frescoes. S. Vittore was rebuilt (1580–1615) after a design by P. Tibaldi and has a neoclassic façade by L. Pollack (1795); there are paintings by F. del Cairo, Morazzone, and Cerano. The baroque campanile (1617–1774) was designed by G. Bernascone. The Palazzo Ducale was built between 1766 and 1772 and has preserved its Italian-style gardens. The Villa Mirabello (18th cent.) contains the Musei Civici, with prehistoric and archaeological collections.

Near Varese is the Sanctuary of S. Maria del Monte, founded in the 7th century, enlarged in 1472 (perhaps by B. Gadio), and renovated in the 16th and 17th centuries. Parts of the crypt date from before the 11th century, and there are 14th-century frescoes. On the way to the sanctuary are chapels with polychromed terracotta sculptures, depicting the Stations of the Cross, and paintings by Morazzone, Nuvolone, and others. Annexed to the Sanctuary is the Museo Baroffio with a collection of altar cloths, gold- and silverwork, and other material.

Vigevano. During the Roman era Vigevano was a fortified trade center. Under the rule of the Viscontis and the Sforzas (14th–15th cent.), Vigevano enjoyed its most flourishing period. S. Francesco (1378; Bartolino da Novara) and S. Pietro Martire (1363; remodeled in 1445 and restored in 1919) are Gothic monuments. The 10th-century castle was transformed in the 14th century and was rebuilt by Lodovico Sforza ("Il Moro") with the collaboration of Bramante (1491–94); it has preserved the walled keep with four battlemented towers, an open loggia which may have been an aviary for falcons, the stables, and external painted decorations and the Palazzo delle Dame. The Piazza Ducale may have been designed by Leonardo (1493–94); it is a vast rectangle from which radiate the seven principal avenues of the city and is surrounded on three sides by uniform porticoed palaces. On the fourth side of the square is the Cathedral. The square is dominated by the Torre del Castello (planned by Bramante). The Cathedral, which existed as early as the 10th century, was rebuilt in the 14th by Bartolino da Novara, in the 16th by Antonio da Lonate, and completed in 1612; the concave baroque façade (1680) is by the Spaniard J. Caramuel de Lobkowitz, and

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

the dome was built in 1708. Inside the Cathedral are several 16th-century paintings. Giacomo Moraglia was responsible for the two Saporiti palaces (1828–1857). The Civico Museo Archeologico has a collection of Roman and prehistoric antiquities as well as paintings by local artists.

Trentino-Alto Adige (*Venezia Tridentina*). A mountainous border region surrounding the valley of the Adige River. In ancient times it was populated by the Raetians, an Alpine people. There are modest traces of prehistoric inhabitants that indicate Celtic influence from the north and paleo-Venetic influence from the south. In the Julio-Claudian period the region was Romanized, most of it forming a part of Italy, the rest going to the extra-Italian provinces of Raetia and Noricum. With the barbarian invasions (especially of the Bawarii, or Baiuwarii, in the Isarco and Pusterthal valleys) the northern territories began to gravitate culturally and linguistically toward the Germanic world (Tirol). In the 11th century the ecclesiastical principalities of Trent and Bressanone began to dominate the area. Later the region became an integral part of the Austrian empire, with which it remained until 1918. At present the region has an autonomous administrative status. The medieval artistic tradition, a provincial Gothic in particular, persisted for a long time in the north; the Trentino, on the other hand, was considerably influenced by the Renaissance, especially under the prince-bishops Bernardo Clesio and Cristoforo Madruzzo. Later Italian and Austrian influences both played their parts. The German- and Ladin-speaking people of the valleys have a strong tradition of folk art.

a. Trentino. Anaunia (Val di Non). Northwest of Trent, this region is divided into the upper and lower Valle di Non by the Noce River. The seat of a Celtic-Raetian tribal community (remains have come to light in excavations near Sanzeno) which gravitated within the orbit of Tridentum. It was finally Romanized by Claudius (A.D. 46; according to the inscription of the *tavola clesiana*, Mus. Naz., Trent) to whom is attributed the foundation of towns in the region, as in the adjacent Val Venosta. The region was converted to Christianity in the 4th century (remains of an Early Christian cemetery under the chapel of the parish church of Sanzeno).

From 1027 to 1802 Anaunia was the fief of the prince-bishops of Trent. The area is rich in medieval castles, which were often built on the ruins of Roman towers. Among the notable castles are Castel Cles, dominated by two rectangular towers (the third was destroyed in the 19th cent.), enlarged and altered in the 16th century by Bernardo Clesio. The façade, the ground-floor loggia in the courtyard, and the frescoing (school of Il Romanino) of several rooms date from this time. Castel Thun, or Tono, rebuilt after 1569, has bastioned walls, an interior court with loggias, and a Chapel of Giorgio with frescoes by the school of Bressanone; Castel Bragher, or Brughiero, has a charming 17th-century court; the Chapel of S. Celestino was frescoed in 1461 by Jacopo Sunter (school of Bressanone). The Renaissance Castel Valer is built around an octagonal tower. There are three courtyards, a loggia decorated with coats of arms, and a Chapel of S. Valerio with frescoes by the Baschenis family (1495). The Renaissance Castel Nanno is a rectangular structure with a small central tower surrounded by low walls with four low corner towers.

Religious structures of the region include the Sanctuary of S. Romedio, which comprises five chapels built one over the other. The oldest chapel, which has a portal dating from 1000, was built in part from material from older structures. There are frescoes variously dated from the 10th to the 13th century. There are numerous churches in the region that were erected by Lombard artisans. Most of these structures are single-aisled with pyramidal-peaked campaniles (e.g., Cles, parish church, by A. Medaglia, 16th cent.). The Baschenis family painted frescoes for a number of these churches, and there are polychromed wood altars in a provincial baroque style.

Romedio nella Valle di Non, Archivi d'Italia e rassegna internazionale degli archivi, XXVII, 1960, pp. 163–83.

Rovereto. Perhaps of Roman origin, the city lies at the foot of the castle built by G. di Castelbarco in the 14th century. The castle was enlarged by the Venetians, who added three circular towers, and transformed by the Austrians into a garrison. It has since been restored. Parts of the 14th-century walls remain. The Palazzo del Municipio, enlarged in the 15th century, has remains of façade frescoes attributed to Fogolino. The Palazzo della Cassa di Risparmio, which dates from the 15th century (rebuilt in its original form in 1906), shows Venetian influence. The Church of S. Marco (1462), which was rebuilt in the 17th century, restored in the 19th, has a baroque interior. The Church of S. Maria del Carmine, which dates from the 14th century, was rebuilt in the baroque period. The Museo Civico is in the Palazzo Iacob.

Trent (Lat., Tridentum). A pre-Roman Raetian settlement, in which traces of Celtic influence have been found, Trent was Romanized in the course of the 1st century B.C. and became a municipium and an honorary colony in the Antonine period. Laid out on a regular plan around the Capitolium (Doss Trento), it was later extended along the left bank of the Adige. An amphitheater of the Julio-Claudian period, sculpture of the 2d and 3d centuries, and 3d-century walls remain. Ruins of an Early Christian church are preserved on the Doss Trento. Invaded by the Goths, Lombards, and Franks, Trent became an episcopal fief in 1027. The city reached its peak of splendor in the 16th century. The medieval city followed the general plan of the old Roman city with its *cardo* and *decumanus*. The oldest monuments date from the Romanesque period. The Cathedral was founded in the 6th century (remains are incorporated in the Castelletto; see below), altered in the 9th century, rebuilt and consecrated in 1145, renovated in the 13th–14th century by Adamo d'Arogno and the Campionesi, and completed in the 16th century. The dome was rebuilt in the 19th century. The Cathedral is in Lombard style; an exterior gallery runs above the apse and along the left side and the façade. A single rose window (Edigio da Campione) adorns the façade, which is flanked by two campaniles (the right one unfinished). On the left side is a porch rebuilt in the 16th century (containing sculpture influenced by Antelami) and the so-called "Madonna degli Annegati" (12th cent.). The porch of the apse contains sculpture by Campionese masters. The interior is a Latin cross covered by rib vaults supported on compound piers. The triapsidal presbytery over the crypt (now filled in; probably of the 12th-cent. structure) was rebuilt in the 18th century; the two side apses contain Campionese sculpture by the school of Adamo d'Arogno; frescoes by Monte da Bologna (14th cent.); numerous tomb slabs; the Cappella del Crocifisso (17th cent.) in the left aisle with canvases by J. C. Loth. S. Lorenzo, dating from the second half of the 12th century, was restored after World War II; it has a basilican plan with composite piers and an octagonal dome. The Palazzo Pretorio (13th cent., restored after World War II) has an older part, the so-called "Castelletto," incorporated within the structure of the Cathedral. The Castello del Buonconsiglio, built on Roman foundations and surrounded by circular bastions of the 16th century, stands within and against the medieval city walls. Towers include the Torre Grande (or Torre di Augusto), the Torresello di Mezzo, the Torre dell'Aquila (with a cycle of International Gothic style frescoes), the Torre Vanga, and the Torre Verde. The castle

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

consists of three structures: the Castelvecchio, dating from the middle of the 13th century, altered and enlarged in the 15th century with a Venetian Gothic loggia; the Magno Palazzo, erected by Bernardo Clesio (1528–36); and a 17th-century structure, the "Giunta Albertiana," linking the two earlier structures. The decoration of the Magno Palazzo is the work of M. Fogolino, Il Romanino, the two Dossis, A. Falconetto, the Carotos, and others. S. Maria Maggiore (A. Medaglia, 1520) is a Lombard Renaissance structure; the façade was rebuilt in the 20th century, but the campanile is Romanesque. Within the church are canvases by Moroni and Cignaroli and a notable *cantoria* (singing gallery) by V. Grandi (1534). The city's numerous Renaissance palaces reveal Lombard or Venetian influences. Such palaces include the Palazzo Tabarelli, Palazzo del Municipio (formerly Tono), Palazzo Geremia, Palazzo Del Monte (the last two with façade frescoes), and outside the city, the Palazzo delle Albere. The Palazzo Galasso is a baroque structure built for the Fuggers. Also baroque is the Church of S. Francesco Saverio (1701), built after plans by A. Pozzo. The monument to Dante (1896) is by C. Zocchi. Modern undertakings include the arrangement of Piazza Italia and the building of the post office, the station, and the monument to Cesare Battisti on the Doss Trento. The Museo Nazionale is in the Castello del Buonconsiglio. The Museo Diocesano Tridentino is in the Palazzo Pretorio. Outside Trent is Civezzano, where there was a Lombard cemetery. The parish church is Renaissance and has paintings by the Bassanos.

b. Alto Adige (Ger., *Tiroler Etschland*). Bolzano (Ger., Bozen). Mentioned for the first time (as Bauzanum) by Paulus Diaconus, Bolzano formed part of the episcopal principality of Trent beginning in the 11th century and was joined to the Tirol in the 16th century. The oldest part of the city is that around the small Romanesque Church of S. Giovanni in Villa (12th cent; frescoes of the 14th–15th cent.), but the greatest building activity was that of the Gothic period, when Bolzano became a major mercantile center. Houses with loggias and balconies, and, outside the city, numerous castles were built. The Cathedral (13th cent.) was rebuilt in the course of the 14th and 15th centuries (restored after World War II). Its form, that of a hall church (*Hallenkirche*), evidences influence from beyond the Alps. The campanile and roof of polychrome tiles are notable. The Dominican Church (deconsecrated), of Italian influence, dates from the end of the 13th century but was altered in the 15th and 17th centuries. The adjacent 14th-century chapel is decorated with contemporaneous frescoes of the Bolognese school. The Franciscan Church, also of Italian influence, was built in the 13th century and rebuilt in the 14th; it has a 14th-century cloister. The baroque Palazzo Mercantile was built about the beginning of the 18th century. In more recent times the city has expanded across the Talvera River and merged with the suburb of Gries, which developed around the Benedictine monastery (with a 15th-century cloister and medieval tower). The Church of S. Agostino (18th cent.) and the Gothic parish church, which preserves a polychromed wooden altarpiece by Michael Pacher, are located in Gries. The Museo Civico is the local museum.

In the environs of Bolzano: Castel Flavon (Ger., Haselburg), originally of the 13th century, remodeled in the 16th, with 16th-century Lombard frescoes. Castel Firmiano (Ger., Schloss Sigmundskron) was rebuilt in the Romanesque period (Torre Bianca and the Chapel of S. Stefano, with frescoes) and enlarged in 1473. Castel Roncolo (Ger., Schloss Runkelstein, 1237); the Sala da Bagno and the Sala del Torneo are decorated with secular frescoes of the late Gothic period (and frescoes of Tristan and Isolde). Castel Sarentino (Ger., Schloss Rafenstein) dates from the 16th century.

Bressanone (Ger., Brixen). In 993 the episcopal seat was transferred to Bressanone from nearby Sabiona. In 1027 the bishops were invested with the temporal dominion of Bressanone, which they retained until 1803, when the territory passed to Austria. The center of the town contains a number of monuments grouped around the Cathedral. The Baptistery is the oldest of the monuments, with frescoes of the 13th–14th century (restored). The adjacent cloister is of Romanesque origin but was rebuilt at the end of the 14th century. The cloister contains a late Gothic fresco cycle (14th–16th cent.), executed by local artists, of subjects drawn from the *Biblia pauperum*. The Cathedral was built on Romanesque foundations (13th cent.) but altered in the 18th century. The façade is flanked by two towers; the interior, on a Latin-cross plan, contains altarpieces by G. Cignaroli and C. and M. Unterberger. There are frescoes by P. Troger. The Church of S. Michele, connected to the Cathedral by the Old Cemetery, has carved medieval tomb slabs. The church was rebuilt in the 15th century with a Gothic campanile. Inside are canvases by F. Unterberger and M. T. Polak. The Palazzo dei Principi Vescovi was begun in the 13th century and enlarged and rebuilt many times, with an inner court flanked on two sides by three tiers of loggias decorated with statues (1559). Characteristic streets are those flanked by houses with porticoes and balconies. Notable among these is Casa Pfaundler, which fuses northern European elements with Italian Renaissance forms. The Museo Diocesano houses the Cathedral treasury, a collection of medieval wooden sculpture, and canvases by local artists.

In the environs: The Monastery of Novacella, built in 1142 with a hospice, enlarged at different periods, fortified in the 15th century against the Turks. Among the oldest structures are the Chapel of S. Michele (12th cent.) with a circular ground plan, transformed into a fortress in the 16th century; the campanile (12th–13th cent.); the cloister, rebuilt at the end of the 14th century, with frescoes of the same period; the Chapel of S. Vittore, Romanesque, with frescoes from the beginning of the 14th century; the monastery church, originally Romanesque, rebuilt in Bavarian baroque form in the 17th century; the library, with a collection of illuminated manuscripts by local schools of the 14th–16th centuries. On a steep rock is the Monastery of Sabiona, an episcopal seat under the patriarch of Aquileia in the 6th–10th centuries; it was destroyed in the 16th century and rebuilt in the 17th. It preserves in part its ancient walls.

Brunico (Ger., Bruneck). Brunico is the principal town of Pusterthal (Val Pusteria). The main street is flanked by old houses that are crowned with crenellated gables. The castle was begun in the middle of the 13th century.

Nearby is the village of San Lorenzo di Sebato (Ger., Sankt Lorenzen), which preserves remains of ancient Sebatum (Roman villa and sculpture of the 2d cent.). The parish church has a wood sculpture of the Madonna and Child by Michael Pacher.

Bibliog. A. Ilg. Aus Brunnecken, Mitt. K. K. Zentral-Kommission, N.S., VIII, 1882, pp. cxxvi–cxxx.

Malles Venosta (Ger., Mals). The Church of S. Benedetto is a single-aisle Carolingian edifice with the entrance on the side. The campanile dates from the 12th century. Within the church are remains of 9th-century stucco decoration (columns and capitals) and frescoes (Christ Blessing, St. Gregory the Great, and St. Stephen in three apsidioles cut into the wall); other figural compositions in registers on the walls and between the windows, with scenes from the lives of SS. Benedict, Paul, and Stephen.

Bibliog. J. Garber, Die karolingische St. Benediktskirche in Mals, Innsbruck, 1915; J. Schmidt, Malles, Bressanone, 1942.

Merano (Ger., Meran). Founded by the Venostes, it was occupied in 17 B.C. by Drusus, who founded the Castrum Maiense. In medieval documents it appears with the names "Meirania" and "Forum Meranum." It was a vassal city of the prince of Trent. There are remains of the medieval city walls and towers (e.g., Torre della Polvere). The Cathedral (14th–15th cent.) has three aisles of equal height (hall church) and an elegant campanile, the city's most important monument. The octagonal Gothic Baptistery has a crypt. The Church of S. Barbara (1423) and the former hospital church

UP State Museum, Lucknow

(a) hall church with a carved double portal and star vaults) are late Gothic structures. The Castello Principesco, with its entrance court, chapel (frequently restored), and tower, dates from 1480. The city has numerous 16th-century houses. Castello S. Zeno, not far from the Torre della Polvere, is a Romanesque structure of the beginning of the 12th century; it was devastated in the 14th century. The surviving chapel portal is adorned with 13th-century carving. The Museo Civico has works by local artists.

In the environs: Castel Tirolo (Ger., Schloss Tirol), built in the 12th century by the Counts of Venosta (from 1141 onward known as the Counts of Tirol; restored). The portals of the atrium and of the two-storied Romanesque chapel preserve 12th-century carvings.

Jahrhundert, Merano, 1957.

Naturno (Ger., Naturns). Noteworthy is the Church of S. Procolo, an 8th-century structure with a single aisle; the campanile is incorporated into the 11th-century rectangular presbytery. Frescoes of about 1400 decorate the exterior. Within are remains of frescoes that may have been inspired by Irish miniatures (St. Paul, figures of angels; 8th–9th cent.).

Schaffran, Die vorromanischen Wandmalereien in der St. Prokuluskirche zu Naturns, Innsbruck, 1958; E. Theil, St. Prokulus bei Naturns, Merano, 1959.

San Candido (Ger., Innichen). Notable is the Collegiate Church of SS. Candido e Corbiniano, founded in the 8th century by Tassilo II, duke of Bavaria, and rebuilt in Romanesque form in the 13th century (frequently restored). Within the church is a polychrome wooden crucifix of the early 13th century. The Church of S. Michele dates from 1760.

Bibliog. G. Tinkhauser, Die romanische Stiftkirche zu Innichen in Tirol, Mitt. K. K. Zentral-Kommission, III, 1858, pp. 225–39; L. Weidemayr, Die Hofmark Innichen, 2 vols., Innichen, 1908–10.

Vipiteno (Ger., Sterzing, Lat., Vipitenum). A Roman way-station in the province of Raetia, the town preserves inscriptions and sculpture of the 2d and 3d centuries. There was a Mithraic sanctuary in the 3d century. In the Middle Ages, Vipiteno was a commercial and mining center. It reached its maximum development in the 15th and 16th centuries, when it was several times the seat of the provincial diet. A late Gothic style of architecture based on northern types is predominant, as is evidenced in the crenelated houses with balconies, façade frescoes, and coats of arms in hammered iron. The Palazzo Comunale (16th cent.) has two battlemented polygonal projections which run along the top of the façade. The triapsidal parish church dates from the 15th–16th century. The Church of the Spirito Santo, with nave and two side aisles, has 15th-century frescoes by local masters. The Ospedale Civico dell'Ordine Teutonico (founded in 1241) was rebuilt in the 16th century. The Museo Civico is in the Palazzo Comunale. The Museo Multscher contains works by Hans Multscher.

Veneto. The modern Veneto comprises the central and historically most important part of the area once inhabited by the ancient Venetii, which was included in the Roman Venetia and later reunified under the hegemony of Venice. The paleo-Venetic culture, whose principal archaeological center is Este and which felt only limited Greek influences (Adria), is known for decorated bronzes and, in particular, for the so-called "art of the situlae," which was also widespread in the Alpine valleys and in Slovenia. Rome and Byzantium left their mark on the region's monuments. From the early Middle Ages onward, the essential fact for the Veneto was the birth and development of Venice on the islands of the lagoon. Venice became one of the great centers of Italian art, for its fusion of eastern and central European traditions in the Romanesque and Gothic periods, for its vital Humanist tendency in the 15th century, and for the development in the 15th, 16th, and 18th centuries of a school of painting and architecture that profoundly influenced European culture.

Adria (Lat., Atria, Hatria). Situated on the Adriatic, to which it gave its name, Adria is divided into three parts by the Canal Bianco (linking the Adige and Po rivers with the Adriatic). A Veneto-Etruscan port, it received, as early as the archaic period, many importations of Attic ceramics. Later, in the 5th century B.C., it seems to have declined because of the competition of Spina. A new efflorescence in the 4th–3d century B.C. is attested by finds of Campanian, "upper Adriatic," and Gallic vases. From the Roman period are remains of a theater and cemetery, the latter including rudimentarily anthropomorphic steles. In the Middle Ages Adria was subject to various rulers. Destroyed in 1482, it was rebuilt and united with Venice. Of Adria's most important buildings, almost all have been rebuilt or altered in recent times. The New Cathedral (G. Baccari, 19th cent.; with a campanile of 1688) incorporates the Old Cathedral with remains of the old baptismal font, crypt, and Byzantine-style frescoes (8th cent.). The Church of S. Maria Assunta della Tomba (restored in 1718) has an octagonal baptismal basin of the 8th century and 15th-century terra cottas. The Teatro Comunale, by G. B. Scarpari, is a 20th-century structure. The Museo Civico contains Greek and Italic vases, objects of the minor arts, and sculpture.

Fogolari, Iscrizioni etrusche e venetiche di Adria, SEtr, XXVI, 1958, pp. 103–52.

Altino (Lat., Altinum). A Roman municipium and, in imperial times, an important transportation center (Via Aemilia, Via Annia, Via Claudia, Via Altinate, port). Its ruins were used in the construction of Venice, hence few traces remain. An interesting type of funerary monument is found here. The Antiquarium contains architectural and decorative fragments.

Bibliog. J. Marcello, La via Annia alle porte di Altino, Venice, 1956; Ist. veneto di Scienze, Lettere e Arti, Atti del Convegno per il retroterra veneziano, Venice, 1956, passim; EAA, s.v. Altino.

Asolo (Lat., Acelum). A polygonal fortress dating from the late Roman Empire stands on a hill above the town. From a Venetic settlement, Asolo became a Roman municipium; ruins of a theater and baths survive. After being dominated by several ruling houses, it was united with Venice. The city is distinguished for its porticoed houses, some of them frescoed. There are remains of the walls, of the clock tower, and the Castello della Regina (Caterina Cornaro, 1489–1509). The Palazzo del Comune (15th cent.) has façade frescoes by A. Contarini (1560). The Palazzo del Municipio dates from the 17th century. In the Cathedral (rebuilt in the 17th cent., completed in the 19th) are canvases by Lorenzo Lotto (1506), L. Bastiani, and Jacopo Bassano. The Museo Civico is in the Loggia del Capitano (archaeological finds, works of Antonio Canova; 17th-century paintings).

In the environs: Church of S. Angelo, with frescoes attributed to Paolo Uccello. Ca' Pasini (17th cent.). Villa Contarini (now Villa del Collegio Armeno di Venezia; 16th cent.), with façade frescoed

UP State Museum, Lucknow

Bassano del Grappa. First documented in the 10th century, a free commune in the 13th, Bassano was united with Venice in 1402. Of the medieval walls there are remains of masonry, towers, and gates (1389–92). Within the walls of the Castello degli Ezzelini is the 15th-century Cathedral. Inside are canvases by the Bassanos. S. Francesco (13th cent.) has a 14th-century vestibule and adjoining chapel. S. Giovanni Battista (oval), and SS. Trinità were rebuilt by G. Miazzi in the 18th century. S. Luigi is decorated with 18th-century stuccoes. Typical of the civil architecture are the small palaces, frequently adorned with porticoes (15th–17th cent.) and decorated on the outside with frescoes: Palazzo Pretorio (14th–15th cent.); the house of Lazzaro Bonamico; and the Michieli houses. The Villa Rezzonico (now Gasparini) may have been designed by B. Longhena. The Ponte Coperto (the covered wooden bridge on the Brenta) is documented as early as 1209 but has been destroyed and rebuilt many times. The Museo Civico has local ceramics, drawings by A. Canova, etchings and popular prints by J. A. Remondini; the painting gallery has works by the Bassanos and Venetian painters.

In the environs: Marostica, a town built on a square plan and surrounded by towers and medieval walls. Just outside Marostica is the Castello Superiore (14th cent.). The Palazzo Municipale (or Castello Inferiore, 15th cent.) is in the Piazza del Castello, which is surrounded by porticoes. S. Antonio Abate has a 13th-century tower and an altarpiece by J. and F. Bassano. Possagno is dominated by the Tempio di Canova, designed by Canova in 1819 on the plan of the Pantheon and completed in 1830. Within are works by Luca Giordano, Moretto da Brescia, Palma Giovane, and A. Canova. The house of Canova and the adjacent Gipsoteca house clay and wax models by the artist and plaster casts of nearly all his work.

Belluno (Lat., Bellunum). Archaeological finds date back to the paleo-Venetic period (5th–4th cent. B.C.). Roman influence is evident in the checkerboard plan of the town. Medieval remains include the Torre Civica (12th cent.), Porta Rugo (12th cent.; restored in 1622), and Porta Doiona (13th cent., rebuilt in 1553). There are remains of the Gothic structure in the Church of S. Pietro (1326, rebuilt in 1750), which preserves two wooden altarpieces by A. Brustolon and canvases by S. Ricci and Lo Schiavone. S. Stefano (1486) is a late Gothic building. The Cathedral was designed by T. Lombardo (beginning of the 16th cent., partially rebuilt in the 19th cent.); with unfinished façade and 16th-century portals. Inside are paintings by Lo Schiavone, C. Vecellio, J. Bassano, and Palma Giovane; the campanile is by F. Juvara. The Baptistery, or S. Maria delle Grazie, dates from the 16th century (restored). Among Renaissance civil edifices are Casa Miari (15th cent.); Palazzo della Banca Cattolica (formerly Doglioni); Palazzo dei Rettori (1491), with porticoed façade and a double row of bifurcated windows; Casa Alpago (15th cent.); Palazzo Persico Piloni; Monte di Pietà (1501); Palazzo Piloni, with frescoes by C. Vecellio. The Ospedale Civile was formerly a seminary (A. Tremignon, 18th cent.). The Teatro Sociale is a neoclassic structure by G. Segusini (1835). The Museo Civico has pre-Roman and Roman antiquities, works of Venetian painters, and a collection of coins and seals.

Castelfranco Veneto. Of medieval origin, Castelfranco originally developed around the castle (1199), a square structure with five towers and brick walls and portals, and surrounded by a moat. The town, now expanded, boasts squares with small porticoed palaces, some of them frescoed. The Cathedral (F. M. Preti, 1723–45) has a panel by Giorgione; in the sacristy are frescoes by Veronese (from the Villa Soranza). S. Giacomo is the work of G. Massari. The Teatro Accademico is by F. M. Preti. The Museo Civico contains archaeological material and paintings by local artists.

In the environs: Villa Comer (now Bolasco; V. Scamozzi, 1607; rebuilt in the 19th cent.); Ca' Tiepolo (now Chiminelli; 16th cent.) with frescoes of the school of Veronese; the "Barchessa" of the Villa Soranza (Sanmichele); remains of the Villa Priuli di S. Felice (Scamozzi); Villa Dolfin (now Carlon; 17th–18th cent.; 18th-cent. stuccoes); Ca' Moro (now Pasinato; 16th cent.; frescoes of the school of Veronese); and the Villa Corner-Chiminelli.

In Fanzolo di Vedelago is Palladio's Villa Emo (ca. 1550), with frescoes by G. B. Zelotti and in part by Veronese.

Chioggia. Originally a Roman *mansio*, Chioggia became a genuine city by the 9th century. Its destiny was bound to that of Venice. S. Domenico (13th cent.; remodeled) has works by A. Vicentino, V. Carpaccio, and L. Bassano. S. Martino is Gothic (1392). S. Andrea is baroque (1743). S. Giacomo was rebuilt by D. Pelli in the 18th century. The Cathedral, originally a Romanesque structure, was rebuilt by B. Longhena (1633–74). The campanile dates from the 13th century. The "Granaio" is a Gothic structure (1322; restored).

The area along the banks of the Brenta is particularly notable for its villas: Villa Foscari ("La Malcontenta," A. Palladio; XI, PL. 32); Villa Mocenigo, with frescoes by G. D. Tiepolo; Villa Lazara Pisani ("La Barbariga"; 17th cent.; enlarged in the 18th cent.), with 18th-century stuccoes and furnishings; and Villa Pisani (Villa Nazionale), in Stra, planned by G. Frigimelica, executed by F. M. Preti (1736–56), with decorations by G. B. Tiepolo. The Palazzo Ferretti, in Dolo, is the work of V. Scamozzi.

Cittadella. A fortified town built in 1220 by the Paduans as a defense against Treviso, Cittadella was successively under the domination of Ezzelino da Romano, the Scaligers, and the Viscontis, and finally became part of the territory of Venice. Elliptical in plan, Cittadella is cut by two intersecting streets and fortified by a wall with 32 rectangular towers, a patrol walk, galleries, moats, and four triple portals with pointed arches. The Torre di Malta was erected in 1251. The neoclassical parish church (1775) contains a canvas by J. Bassano.

BIBLIOG. Il Castello di Cittadella: Cenni storici, Padua, 1899.

Concordia Sagittaria (Lat., Julia Concordia). This village is situated on the site of a Roman settlement, perhaps founded in 42 B.C., on the Via Annia. A flourishing trade center in the early Empire, it later became a center for the manufacture of arms. The course of the Roman wall and the probable location of the forum and the theater have been identified. An Early Christian burial area (4th–5th cent.), a *cella trichora*, and remains of a cemetery basilica have been excavated. The Romanesque baptistery (13th cent., restored) is built on a Greek-cross plan with three apses. The Cathedral, a Gothic-Renaissance structure, has a Romanesque campanile. Interesting sarcophagi of the Sidamara type and numerous other fragments are in the Museo Concordiese in Portogruaro (see below).

UP State Museum, Lucknow

Caorle was probably the port of ancient Concordia. Destroyed many times by the barbarians, Caorle was an episcopal seat until the 19th century. The Romanesque Cathedral (1048) has a cylindrical campanile of Ravenna type (end of the 11th cent.).

Conegliano. The town grew up around the Castle (10th cent.?; now in ruins), of which survive the bell tower and the Torre Mozza. Characteristic are the arcaded streets with frescoed houses. The Cathedral (1352) has a 14th–15th-century façade. The restored interior has works by L. Toeput and Cima da Conegliano; the adjacent Sala dei Battuti (14th cent.) has frescoes of the schools of Lombardy and the Veneto (15th–16th cent.). S. Rocco (1630–40) has a 20th-century façade. S. Martino dates from the 17th–18th century. The Palazzo Montalban Vecchio is attributed to Longhena; the Palazzo Montalban Nuovo was built by A. Zorzi in the 18th century. The Teatro dell'Accademia is neoclassic (1869; A. Scala). The Museo Civico del Castello has a collection of local paintings.

In the environs: Villa Paccagnella (17th cent.); Villa Giustinian (1665); and Villa Mondini (17th cent.).

Este (Lat., Ateste). Este was the center of the paleo-Venetic culture. Its necropolises, sanctuaries, and certain areas of the town have yielded abundant remains of its early artistic production, especially of vases and decorated bronzes. Remains of two bridges, an aqueduct, and some houses with mosaics date from Roman times. Rebuilt in the Middle Ages, Este became the domain of the Este family in 1050 and later was joined to Venice. The town is dominated by the castle (1339), which was built on the site of an 11th-century fortress. Este has developed on a rectangular plan, with its center in the Piazza Maggiore. The Romanesque Church of S. Martino has a campanile dating from 1293. The Cathedral, a medieval structure rebuilt (1690–1708) by A. Gaspari, has an elliptical plan. Inside is a painting by G. B. Tiepolo and a marble composition by A. Corradini (1725). The upper portion of the campanile was erected in the 18th century on an 8th-century base. The Church of the Beata Vergine delle Consolazioni (Church of the Zoccoli; 1505) has a single aisle, with later additions; there is a Madonna and Child by Cima da Conegliano. The Church of the Beata Vergine della Salute (17th cent.) has an octagonal plan; there are two octagonal campaniles flanking the apse. S. Maria delle Grazie (mid-15th cent.) was rebuilt in the 18th century. The Torre di Porta Vecchia was reconstructed in 1690. The Arch of S. Francesco was built in the 16th century. The former Church of S. Michele has a façade by V. Scamozzi. The Villa Cornaro (now Benvenuti) has a 19th-century park by G. Japelli. The Villa Contarini, known as the Vigna Contarena, was built in the 17th century. The Palazzo del Municipio is an 18th-century edifice. The Palazzo del Principe was designed by V. Scamozzi. The Palazzo Mocenigo dates from the end of the 16th century. The Museo Nazionale Atesino is in the castle of Umbertino de Carrara.

In the environs: Arquà Petrarca, with the 14th-century house of Petrarch. The marble sarcophagus of the poet was erected in 1380; the bronze bust, by P. P. Valdezocco, was added in 1547. Monselice: The castle (Ca' Marcello) was founded in the 13th century, enlarged by Ezzelino da Romano, by the Carraresi and by the Marcellos; it was restored in 1935–39. There is a collection of paintings, sculpture, and medieval and Renaissance household objects. The old Cathedral (S. Giustina) was built in 1256. S. Giacomo is Romanesque-Gothic, with restored interior. Other noteworthy structures include the Sanctuary of the Sette Chiese (V. Scamozzi, with paintings by Palma Giovane); Villa Duodo, now Balbi-Valier (V. Scamozzi and A. Tirali); Torre Civica (1244; upper part, 16th cent.); Loggia del Monte di Pietà (16th cent.); Villa Nani-Mocenigo (16th–17th cent.); and the ruins of the fortress of Frederick II. Valsanzibio di Galzignano: Villa Barbarigo, now Pizzoni Ardemagni, with Italian-style garden and fountains (17th cent.).

Feltre (Lat., Feltria). A Roman center, probably a municipium, which succeeded what may have been a Raetian community on the Via Opitergium-Tridentum. In the Middle Ages, Feltre was a free commune and later came under various rulers. In 1420 it passed to Venice. The old walled city has a number of 16th-century buildings, many with projecting roofs and with frescoes or graffiti. Almost all the city gates are Renaissance (e.g., Porta Pusterla, Porta Castaldi). The Cathedral (16th cent.) has a Gothic apse, a 9th-century crypt, and a campanile of 1392 (partially rebuilt in the 17th century). The Baptistery (15th–16th cent.) has works by L. Bassano. The Church of Ognissanti (altered) has a Transfiguration by Morto da Feltre. S. Maria degli Angeli was erected in 1492, and the Church of S. Rocco in 1599. The design of the former Palazzo Comunale is attributed to Palladio. The Museo Civico, in Palazzo Villabruna (Venetian Gothic), has an archaeological section, a picture gallery, and a collection of medals, bronzes, and ceramics. The Galleria d'Arte Moderna "Carlo Rizzarda," in Palazzo Cumano (16th cent.), has a collection of wrought iron and 19th–20th-century paintings.

In the environs: Sanctuary of SS. Vittore e Corona (1096–1101) in Byzantine style, with 15th-century frescoes. Lentiai: S. Maria Assunta (15th cent.), with coffered ceiling and paintings by C. Vecellio and Palma Vecchio. Soranzen: Villa Bovio (17th cent.); Villa Martini e Moro (17th–18th cent.); Villa Mauro (18th cent.). Mel: Parish church with works by C. Vecellio and Lo Schiavone.

Salmi, Miscellanea preromanica: Il Campanile di Ognissanti a Feltre, Atti I Cong. int. S. Longobardi, Spoleto, 1951, pp. 473–75; A. Dal Zotto, Introduzione alla storia antica di Feltre, Padua, 1955; EAA, s.v. Feltre. For Lentiai: O. Monti, Lentiai e le sue opere d'arte, Arte e storia, II, 1883, pp. 138–40.

Lonigo. The earliest documentation dates from 997. After having been subject to various rulers, Lonigo passed to Venice in 1404. There are ruins of a medieval castle and tower near the Cathedral (Neo-Romanesque, 19th cent.). The medieval Church of SS. Quirico e Giulitta (much restored) has a 16th-century campanile. The Palazzo Pisani (1557), now the Palazzo Comunale, is attributed to M. Sanmicheli. The Rocca Pisani (1578) was built by V. Scamozzi on the site of an earlier castle. The Villa Giovanelli (19th cent., G. Balzaretti) encloses a Benedictine cloister (rebuilt and restored, 19th cent.).

In the environs: the Franciscan hermitage of S. Daniele (1243), with a much restored 15th-century church and a Gothic cloister. Sanctuary of the Madonna dei Miracoli (façade in Lombard style; 1488–1501). Villa Costozza (at Villa del Ferro), in the style of Sanmicheli (16th cent.).

Bibliog. A. Melani, Lonigo e il suo Duomo, Arte e storia, III, 1884, pp. 75–76; G. Lorenzoni, Ancora del Santuario di S. Maria dei Miracoli di Lonigo, B. Centro int. S. Arch. A. Palladio, II, 1960, pp. 93–96.

Montagnana. A Roman *vicus* and subsequently a medieval Lombard center, Montagnana passed to Venice in 1405. The old town is within the rectangular complex of well-preserved turreted walls built by Ezzelino and the Carraresi (12th–14th cent.). The walls have four gates and are surrounded by moats. The Cathedral (1431–1502) was built on the site of 11th-century structures (a few traces remain); a portal is attributed to J. Sansovino. The single-aisled interior (restored) has a Transfiguration by Veronese. The Church of S. Francesco was erected in the 14th century and altered in the 15th and 17th centuries. The Church of S. Benedetto dates from the 17th–18th century. The Palazzo Foratti (attributed to A. Lamberti; 15th cent.) has Venetian Renaissance features. The Palazzo del Municipio was

UP State Museum, Lucknow

built on a plan by Sanmicheli (remodeled in the 17th–18th cent.). The Villa Pisani, now Placco (16th cent.), has a central part designed by Palladio (ca. 1565).

Oderzo (Lat., Opitergium). Originally a paleo-Venetic settlement, it later became a Roman center, probably a municipium. In the Middle Ages it was devastated several times. The single-aisled Cathedral was built in the 10th century, rebuilt in the 14th, and altered in succeeding centuries. There are small palaces of various periods, all characteristically Venetian in aspect. Some of them have frescoed façades (15th–16th cent.). The Museo Civico contains archaeological finds, including mosaics.

Bellis, Cenni storici sul Duomo di Oderzo, Treviso, 1958; B. Forlati Tamaro, Guida del Museo Civico di Oderzo, Milan, 1958.

Padua (Lat., Patavium; It., Padova). Of paleo-Venetic origin (necropolis), it became a Roman colony in 89 B.C. and a municipium in 49 B.C. From the 4th century onward it was an episcopal seat. Destroyed in 602, it flourished once again during the period of the city-states and was annexed by Venice in 1406. The Roman city was laid out on the *cardo* and *decumanus* and contained within the rectangular area formed by the river channels. (The modern city has followed the same plan.) There are traces of a river harbor and bridges that spanned the Medoacus (Bacchiglione), ruins of an amphitheater and forum, and numerous tombs. From the Early Christian period dates the Chapel of the Madonna in the Church of S. Giustina (5th–6th cent.). In the Romanesque period the city was enclosed with new walls, and S. Sofia (end of 9th–12th cent.) and S. Giustina were rebuilt. Building activity of the 13th century is attested by the Palazzo della Ragione (1215–19), to which was added in 1306 another story, the exterior loggias, and the roof (rebuilt in the 18th cent.); the Palazzo del Podestà (now Palazzo Municipale, rebuilt in the 16th cent. with a façade of 1930); the Palazzo della Cancelleria; and the Palazzo degli Anziani (1285; restored). These formed the civic center of the city. The religious center comprised the Cathedral (rebuilt in the 16th-century), the Baptistery (1171, rebuilt in 1260; fresco cycle and polyptych by Giusto de' Menabuoi), the Palazzo Vescovile (1309, altered many times), and the Biblioteca Capitolare. Erected at some distance from the center were the principal monastic buildings of the city. S. Antonio ("Il Santo") a Franciscan church (begun 1231) of Latin-cross plan, roofed with domes, represents a fusion of Romanesque forms with Gothic and Byzantine elements; later additions to the church are the Chapel of the Blessed Luca Belludi (or Cappella dei Conti, 1382), with frescoes by Giusto de' Menabuoi, the Chapel of Gattamelata (or Cappella del Sacramento, 15th cent.), the baroque Cappella delle Reliquie (or "Cappellone"; 1689), the Chapel of S. Felice (or S. Jacopo) by A. de Sanctis (1372–78), with frescoes by Altichiero and Avanzo (I, PL. 68), the Cappella dell'Arca del Santo (16th cent.), with low reliefs of scenes from the life of St. Anthony and sculptures by A. and T. Lombardo, Sansovino, D. Cattaneo, M. Mosca, and others; in the presbytery, enclosed by an altar rail with sculptures by T. Aspetti (1593) and bronze gates by C. Mazza (1661), is the main altar, the arbitrary reconstruction by C. Boito (1895) of the dismantled original altar of Donatello (1446–50; IV, PLS. 248–251); numerous sculptures and tombs. Adjacent is the monastery (passage with frescoes by G. de' Menabuoi), with the Chiostro del Capitolo (1240) and the Chiostro del Noviziato (Romanesque portal surmounted by a Renaissance loggia); there are remains of the Chiostro del Paradiso (1229) and the Chiostro del Generale (1434). The Oratory of S. Giorgio has frescoes by Altichiero and Avanzo (I, PLS. 69, 70, 72, 73). The Scuola di S. Antonio (1430; raised higher in the 16th cent.) has frescoes by Titian and others. Among the Romanesque-Gothic buildings is the Church of the Eremitani (1276–1306), single-aisled with transept and a timber roof with a trilobate arch. (The east end of the church was destroyed in World War II along with the frescoes in the Ovetari Chapel; it has been rebuilt.) Other structures of the period include S. Maria del Carmine (1212; altered many times) and the adjacent Scuola del Carmine (14th cent.), with 16th-century frescoes. On the site of the ruins of the Roman arena is the Scrovegni Chapel (beginning of the 14th cent.), single-aisled, barrel-vaulted, with frescoes by Giotto (II, PL. 287; III, PLS. 211, 392; VI, PLS. 199–203); on the altar is a Madonna and Child by Giovanni Pisano (VI, PL. 211); behind the altar is the tomb of Enrico degli Scrovegni by A. de Sanctis. S. Maria dei Servi (late 14th cent.) has a 16th-century arcade. The earliest Renaissance structures in Padua appeared sporadically during the 15th century. New chapels were added to the more important churches, and many church interiors were remodeled. In the Piazza del Santo is Donatello's monument to Erasmo da Narni (IV, PL. 249). In 1493 work was begun on the new building for the university (founded in 1222), with façade (altered) and courtyard by Andrea Moroni (16th cent.), the Teatro Anatomico, the first such anatomical theater in Europe (1544), and the Aula Magna, decorated with coats of arms (enlarged in 1938). Other civil buildings of the period include the Loggia della Gran Guardia (or del Consiglio) with columned portico (A. Maggi, 1496; B. Rossetti, 1523). The Monte di Pietà, erected in the Middle Ages, was rebuilt by G. M. Falconetto (1530) and enlarged in the 17th century by V. Dotto. In the 16th century, the city walls were again enlarged and reinforced with bastions (e.g., Bastione della Gatta). Also rebuilt was the Church of S. Giustina, attributed to Andrea da Valle and A. Moroni (1518–87), after plans by A. Briosco. Built on a three-aisled, Latin-cross plan, with barrel vault, the interior decoration constitutes an important ensemble of Venetian paintings of the 16th–18th centuries. In the Coro Vecchio (1462) are 15th-century funerary monuments. In the Benedictine monastery is the so-called "Chiostro Dipinto" (15th cent.), with remains of the original frescoes of the life of St. Benedict, by Bernardo Parentino and Girolamo del Santo. The Cathedral (S. Maria Assunta, by Andrea da Valle, mid-16th cent.) has a three-aisled Latin-cross plan. Inside is the sarcophagus of Cardinal Pileo da Prata, attributed to the Dalle Masegnes (14th cent.); panels of St. Sebastian, the Trinity, the Madonna dell'Umiltà, and the Epiphany by Nicoletto Semitecolo (1367); and paintings by G. D. Tiepolo, F. and G. Bassano, D. Campagnola, Paris Bordone, and others. The Treasury has fine medieval objects. S. Gaetano, by V. Scamozzi, is a single-aisled structure. The Palazzo Pesaro, formerly Priuli, is also by V. Scamozzi (ca. 1590). The Casa degli Specchi, by A. Maggi, dates from the 16th century. The Palazzo dei Monti Vecchi (now the Banca Popolare) was erected in 1590. The Palazzo Mantova-Benavides, now Protti, dates from the 17th–18th century. There are few baroque monuments, including the Valaresso Arch (1632) in Piazza del Duomo and the Palazzo Selvatico by G. Frigimelica. Structures of the 18th century are the Palazzo Papafava (1763), with a neoclassic interior, and the Teatro Verdi (1748), which was remodeled by G. Japelli (1847), who also designed the Caffè Pedrocchi and Il Pedrocchino (X, PL. 292). Twentieth-century architecture includes the Liviano, part of the University, with frescoes by M. Campigli and a sculpture, *Titus Livius*, by Arturo Martini. The Museo Civico has a collection of antiquities, a painting gallery (15th–19th cent.), and a collection of small sculptures. The Museo Bottaccin is annexed to the Museo Civico. The Museo Antoniano contains works from the Church and Monastery of S. Antonio.

There are numerous villas in the environs, including Villa Spessa (15th cent.), in Carmignano di Brenta; Villa dei Vescovi, in Luvigliano di Torreglia, begun by B. Bon and continued by G. M. Falconetto; "Il Cataio," a battlemented castle (1570–72) with a large park, frescoes by G. B. Zelotti (1571); Villa Emo Capodilista (16th–17th cent.), in Battaglia Terme, with frescoes by Luca Ferrari (1650) and others. In Noventa Padovana are Villa Cappello (16th cent.), Villa Giustiniani (now De Chantal; 17th cent.), and Villa Giovanelli (now De Benedetti, 18th cent.). In Piazzola sul Brenta is Villa Camerini (formerly Contarini degli Scrigni), a Palladian structure with baroque additions.

Pieve di Cadore. The origins of the chief town of Cadore go back to Roman times. The town was particularly prosperous in the 14th, 15th, and 16th centuries and long enjoyed the protection of Venice. The Palazzo della Magnifica Comunità Cadorina (1525) was built over a 15th-century building. The parish church (19th cent.) has paintings by Titian and C. Vecellio. The house reputed to have been Titian's, a typical local construction, has been transformed into a museum. The Quadreria di Guglielmo Talamini and the Museo dell'Arte Paleoveneta are in the Palazzo della Magnifica Comunità Cadorina.

In the vicinity is Lagole di Calalzo, where an ancient sanctuary with paleo-Venetic bronzes was discovered. Rizzíos is a typical regional village with wooden constructions.

Portogruaro. A fortified commune in the Middle Ages, Portogruaro was subject to the Venetian Republic after 1420. The city extends along two parallel streets, flanked by 15th- and 16th-century buildings, some of them frescoed, with arcades supported by low piers and with high pointed arches. Three medieval gates and remains of moats survive. The Palazzo Comunale has a brick façade with an ornamented gable (14th–16th cent.; enlarged and restored in the 19th cent.). The Palazzo dal Moro and the Palazzo Fabris are by G. Bergamasco. The Cathedral (17th cent.) has a Romanesque campanile. The Romanesque baptistery is built on a Greek-cross plan and is triapsidal; the atrium (restored) is from the early 12th century. The Museo Concordiese has a collection of objects excavated in Concordia Sagittaria.

Zovatto, Concordia e l'antica struttura urbana di Portogruaro, Il Noncello, 12–13, 1959, pp. 193–215.

Praglia. The Benedictine monastery of Praglia was founded in 1080. The Church of the Assunta (1490–1548) is by T. Lombardo; built on a Latin-cross plan, the church has a nave and two side aisles and has barrel vaults. The campanile is Romanesque (1292–1300). The monastery comprises four cloisters, the Chiostro Doppio di Levante (1460), with ogival portico and loggia, the Chiostro Pensile, begun in 1495, the Chiostro Botanico (15th cent.), with trilobed double-lancet windows and terra cottas, and the Chiostro Rustico, with a terra-cotta frieze.

Rovigo (Lat., Rhodigium; Rodigo). First documented in the 9th century, Rovigo remained under the rule of the house of Este until its union with Venice (1482). Rovigo is pentagonal in plan and encircled by walls. The Porta S. Bortolo was erected in 1482–86. The Cathedral was founded in the 10th century, rebuilt in the 15th century and again in the 17th, after plans by G. Frigimelica (1696); the dome was added in 1790 (G. Sabadini). The single-aisled interior is in the form of a Latin cross. The Church of S. Francesco (begun in the 14th cent.; campanile of 15th cent.; remodeled in 19th cent.; façade of 20th cent.), is built on a Latin-cross plan. The Church of the Beata Vergine del Soccorso, called "La Rotonda" (1594), is by F. Zamberlan, a pupil of Palladio; the church is octagonal in plan and surrounded by a trabeated portico; the campanile is by B. Longhena (1655). S. Bartolomeo has a baroque façade and campanile attributed to Fra Giovanni da Verona; the interior has rich stucco decorations. In the adjoining Convento degli Olivetani is a Renaissance cloister and a wellhead attributed to J. Sansovino. The Palazzo Roverella was designed by an architect from Ferrara (begun in early 15th cent.). The Palazzo Roncale (1555), with rusticated portico, is by M. Sanmicheli. The Palazzo del Municipio was built in the 16th century and remodeled in 1765. The Palazzo Angeli (now the Questura) was erected in 1780 by F. Schiavi. The Seminario Vescovile is an 18th-century construction (D. Cerato). The Palazzo dell'Accademia dei Concordi, by S. Baseggio the Younger (1814), houses the Museo del Risorgimento and a painting gallery. The Museo del Seminario Vescovile has an archaeological collection, Venetian paintings of the 16th–18th centuries, sculpture, miniatures, etc.

Near Rovigo is Badia Polesine, where there are remains of the Abbey of Vangadizza, founded in the 10th century and remodeled in the 15th. In Fratta Polesine is the Villa Badoer (now Cagnoni), designed by Palladio, and the Villa Bragadin (16th cent.).

Cappellini, Rovigo nella storia e nell'arte, Rovigo, 1934.

Thiene. A Roman settlement, a fortified center in the Middle Ages, and later a free commune (12th cent.), Thiene finally came under the hegemony of the Venetian Republic. The town, with its elegant Renaissance structures with multiple-lighted mullioned windows and arcades, developed around the Palazzo Porto Colleoni (now Thiene; after 1450). (The palace is also known as the Castello di S. Maria.) The Church of Vincenzo was erected in 1330 and frescoed in the 14th–15th century. The Cathedral (1669; enlarged) was built over an earlier structure.

Near Thiene is Lugo di Vicenza, the site of Villa Godi (now Valmarana) and the Villa Piovene Porto Godi, both by Palladio. In Villaverla is the Palazzo Verlato (now Dalla Negra Dianin), by V. Scamozzi (1576; enlarged in 17th cent.), and the Palazzo Ghellini (now Dall'Olmo), by A. Pizzocaro (17th cent.).

Bibliog. S. Rumor, Il Castello di S. Maria di Thiene . . . , Vicenza, 1887.

Treviso (Lat., Tarvisium). A Roman municipium built on the site of an earlier Veneto-Gallic settlement, Treviso became a free commune in the Middle Ages and later adhered to the Venetian Republic. From the communal period (11th–12th cent.) are the Baptistery, the crypt of the Cathedral, the ruins of S. Vito, and the Loggia dei Cavalieri (1195), with two layers of frescoes. The modern center of Treviso (Piazza dei Signori) coincides with the medieval one and is the site of municipal buildings, including the Palazzo dei Trecento (13th cent.; enlarged in the 16th, and later restored) and the Palazzo Pretorio (rebuilt), both crenelated. The Torre del Comune surmounts the Palazzo del Podestà (now Palazzo del Governo). Romanesque and Gothic structures include S. Caterina dei Servi di Maria, with a single aisle (14th–15th-cent. frescoes); S. Francesco (much restored), on a Latin-cross plan, with a single aisle and five apsidal chapels; and S. Nicolò, on a Latin-cross plan, with nave and two aisles. In S. Nicolò are frescoes by Tommaso da Modena and the monument to Agostino Onigo (early 16th cent.), with decoration by L. Lotto. The adjacent Seminario Vescovile (13th–14th and 16th cent.) has frescoes by Tommaso da Modena (1352) in the Sala del Capitolo dei Domenicani. The 14th-century Church of S. Lucia, with nave and two side aisles, has contemporaneous frescoes. S. Maria Maggiore (called "Madonna Grande"; 1474), a late Gothic structure of Venetian type, was rebuilt on the site of an earlier structure. The Cathedral, a Romanesque structure (ruins uncovered by bombardments), was rebuilt in the 15th–16th century (apsidal section) on designs by P. Lombardo and his sons (15th–16th cent.); all but the apse was remodeled by G. Riccati (18th cent.). The Cathedral has frescoes by Pordenone and assistants (1520), an Annunciation by Titian, and reredos by P. Bordone. The Romanesque baptistery (11th–12th cent.) was extensively remodeled. Inside the building of the Monte di Pietà is the Cappella dei Rettori (16th cent.), decorated with gilded leather (17th cent.) and Biblical scenes by L. Toeput. The Church of S. Gaetano (1504) is the work of Jacopo da Como, and S. Maria Maddalena (1576) is a Renaissance structure. The Church of S. Vito was founded in the 12th century and rebuilt in 1568. The façade decorations of several Renaissance structures have been traditionally attributed to such artists as Titian, P. Bordone, and Pordenone. Baroque buildings are few, but noteworthy structures are S. Agnese in SS. Quaranta, of Palladian type (1613),

and the rococo S. Agostino (1750–58), by F. Vecelli. The Museo Civico Luigi Bailo has collections of prehistoric objects, classic and medieval marble sculptures and reliefs, and paintings from the Middle Ages to the 18th century. The Museo della Casa Trevigiana houses works of the minor arts.

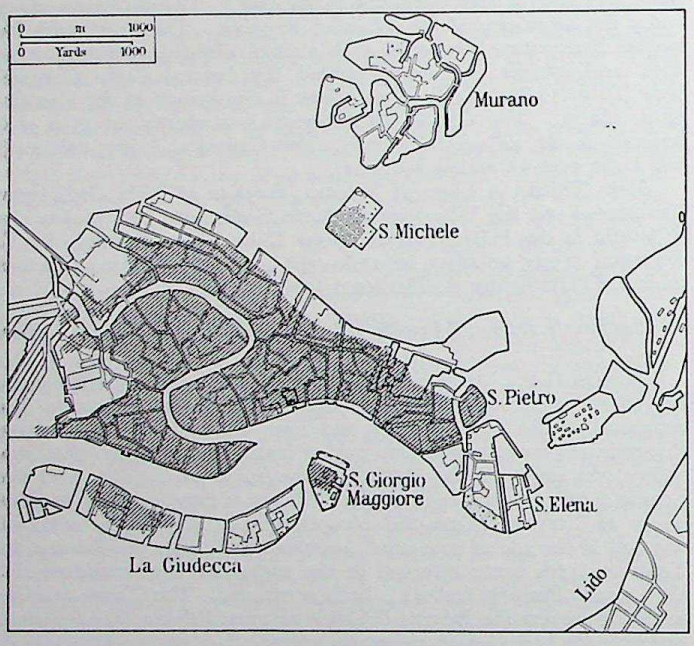
Venice (It., Venezia). Venice was founded in the lagoons between the mouths of the Piave and Brenta by fugitives from the barbarian invasions inland. The city comprises more than 100 islands linked by bridges. In the 9th century the center was the Civitas Rivoalti (comprising the modern zone of the Rialto, S. Marco, and the Arsenale). Dependent on Byzantium, Venice declared its sovereignty in the 11th century as a marine republic. The city became an active center of cultural exchange between East and West and extended its sway to the surrounding mainland.

Venice is divided in two by the Grand Canal and irregularly linked by quays, narrow streets, and small squares, laid out parallel to the canals or intersecting one another in a closely woven network.



Venice and environs. Shaded area indicates extent of the city in the 12th century.

Of the earliest structures (9th cent.), known from written sources, few traces remain (crypt, remains of foundations, and marble carvings in S. Marco). Building activity was intense during the Romanesque and Gothic periods, which gave a particular stamp to the city. The civil monuments of the time, characterized by successive ranks of galleries (e.g., Palazzo Loredan dell'Ambasciatore), often reveal Near Eastern influences, and their decoration consists largely of spoils taken from the eastern Mediterranean (e.g., patens, low reliefs, faience bowls). Other Eastern works include the four bronze horses of S. Marco (Greek work of the 4th–3d cent. B.C.); the group of the Tetrarchs (4th cent. of the Christian Era), and the two pilasters with rinceaux in front of the Baptistery door. In 1073, the new Church of S. Marco was erected on the site of the earlier basilica. S. Marco, which has a central plan and is topped by domes, blends Romanesque and Byzantine elements in its structure; the crowning reveals late Gothic influences. Decorated with Byzantine and local sculpture, and with the narthex and interior completely covered by mosaics (12th–14th cent.; several times restored), S. Marco is a unique Italian Romanesque creation. The interior has a nave and two aisles, galleries (reduced to catwalks after the fire in 1145), and a chancel built over the crypt (that of the preceding building). The choir screen is surmounted by statues of the Madonna and the apostles, by the Dalle Masegnes (14th cent.; VI, pl. 368). The church is adorned with works from various centuries, including the bronze doors (11th–16th cent.), the ciborium of the high altar, with two Early Christian and two Romanesque columns (according to some experts, the entire ciborium is Romanesque), the Pala d'Oro (IV, pl. 405), Renaissance sculptures, and 15th–16th-century mosaics by Tuscan and Venetian artists. The Campanile was rebuilt in 1903–12, an exact copy of the earlier structure, which collapsed. Dating from the Gothic period is the reconstruction of the Doges' Palace (VI, pl. 340; original building from the 9th cent.), connected with S. Marco by the Porta della Carta (B. Bon; 1438–42). Work on the Doges' Palace continued well into the 15th century: the east façade (1483) was designed by A. Rizzo, who was also responsible for the Scala dei Giganti (pl. 198) and courtyard. The interior of the palace was decorated by some of the major Venetian artists, particularly during the Renaissance. The Avogaria contains work by D. and J. Tintoretto. The Scala d'Oro was probably created under the direction of J. Sansovino and Scarpagnino (Antonio di Pietro Abbondi), with stuccoes by A. Vittoria. The Atrio Quadrato and the Sala delle Quattro Porte were decorated by J. Tintoretto, G. B. Tiepolo, and others. The Anticollegio and the Sala del Collegio were built after designs by Palladio (1575) and decorated by A. Vittoria, Veronese, J. Bassano, and J. Tintoretto. The Sala del Senato (or Sala dei Pregadi) has works by J. Tintoretto. The Sala del Consiglio dei Dieci (preceded by a room containing works by H. Bosch, II, pl. 320) has works by Veronese, as does the Sala della Bussola. The Saletta dei Tre Inquisitori di Stato has a ceiling frescoed by J. Tintoretto. The Sala dell'Armamento (or Sala del Guariento) preserves fragments of frescoes by Guariento. The Sala del Maggior Consiglio was decorated by Tintoretto (*Paradise* and other works), P. Veronese, F. da Ponte, Palma Giovane, L. Bassano, and D. Tintoretto.

A great many churches were built in the Gothic period. SS. Giovanni e Paolo (1246–1430; façade remodeled in the 15th cent.) has a nave and two side aisles, a groin vault, and polygonal apse, illuminated by two rows of mullioned windows; the church contains Gothic and Renaissance tombs. There are frescoes and canvases by Venetian artists from the Renaissance to the 18th century. S. Maria Gloriosa dei Frari (1338–1443) is similar in plan to SS. Giovanni e Paolo and has been adorned through the centuries with paintings and sculpture. The campanile dates from 1396. S. Maria del Carmelo (14th cent.) was extensively remodeled in the 16th and 17th centuries; the façade has a curved tympanum (16th cent.). S. Polo seems to have been founded in the 9th century; it was remodeled several times during the Gothic period and in the 19th century; it has a nave and two side aisles, all with apses, and a carinate ceiling. S. Stefano, built in the 14th century and remodeled in the 15th, has a nave and side aisles, polygonal apse, carinate ceiling, and chancel (1488). The cloister is attributed to Scarpagnino. S. Giovanni in Bragora, perhaps first built in the 8th century, was rebuilt in 1475 and restored in 1728. The Gothic interior has a nave and two side aisles and a carinate ceiling. The Church of the Madonna dell'Orto was erected in the 14th century and remodeled in the 15th and 16th centuries; the decorated brick façade is crowned with statues by the Dalle Masegne brothers. The former Church and Abbey of S. Gregorio (9th cent.; rebuilt in 15th) has a cloister dating from 1342. The former Church of the Carità, originally a Gothic structure, was rebuilt by B. Bon (1441–52); part of the courtyard by Palladio survives. Among the outstanding examples of civil architecture which continued Gothic forms even during the 15th century are the Ca' d'Oro, Ca' Foscari, and the Pisani, Contarini (1421), Priuli, Contarini-Fasan (called the "Casa di Desdemona"; 1475), Da Mula (now Morosini), Loredan, Giustinian, Brandolin, Erizzo alla Maddalena, and Minotto palaces.

More akin to Renaissance models, yet maintaining the characteristic Venetian predilection for tracery surfaces, are the palaces (15th and early 16th cent.) with large semicircular arches, often adorned with marble revetment, clipei, and polychrome decoration. Among these structures are the Lombardesque Dario (1487) and Grimani palaces; Palazzo dei Dieci Savi (1521) and the Fabbriche Vecchie di Rialto by Scarpagnino (1522); Palazzo dei Camerlenghi (G. Bergamasco, 1522–28); Palazzo Trevisan (formerly Cappello), by B. Bon and G. Bergamasco; Palazzo Zorzi a S. Severo, by M. Coducci; the unfinished Ca' del Duca; Palazzo Contarini delle Figure; Palazzo Corner-Spinelli and Palazzo Vendramin Calergi (formerly Loredan), with spacious, two-lighted, round-arched windows, and a double order of fluted columns, both palaces attributed to M. Coducci; and the Fondaco dei Tedeschi, whose courtyard has superimposed galleries. The walled and towered Arsenale was enlarged several times from the 11th to the 16th century. Within the walls are structures by Sanmicheli (1544–47) and A. da Ponte (1579); the outer gateway is by Gambello (1460) and is adorned with sculptured lions from Athens and Delos. The Fort of S. Andrea (1543) on the island of the Vignole, opposite the Lido, is by Sanmicheli. Renaissance, too, are the structures in the Piazzetta and Piazza S. Marco: the Loggetta di S. Marco,

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

with relief decoration and four bronze statues by J. Sansovino; the Libreria Vecchia di S. Marco, begun by Sansovino and continued by V. Scamozzi; the Palazzo della Zecca (1536), also by Sansovino, with a massive rusticated front. The Torre dell'Orologio (clock tower) in Piazza S. Marco is by M. Coducci (1496–99); the famous bronze Moors that sound the hours are 15th-century works. The Procuratie Vecchie, by B. Bon (1514) and G. Bergamasco, was modeled after a Byzantine structure and has two superimposed orders of galleries and decorative battlements. The Procuratie Nuove, begun (1444–65) and began the façade, which was completed by M. Coducci (1480–1500). The interior comprises a nave and two side aisles, with semicircular arches, groin vaults, and polygonal apse. The church is adorned with works by Giovanni Bellini (II, PL. 266), Tintoretto, and Palma Giovane. The Chapel of S. Tarasio has frescoes by A. del Castagno (I, PLS. 234, 235) and polyptychs by A. Vivarini and Giovanni de Alamagna (1443). The interior of S. Maria Formosa, founded in the Middle Ages, was completely rebuilt by M. Coducci (1492), with nave and two side aisles, transept, and

by V. Scamozzi (1584) and completed by B. Longhena (1640), has a colonnade with piers and half-columns supporting two rows of windows. The Fabbrica Nuova (1810) is by G. Soli. Noteworthy Renaissance religious edifices of the 15th and 16th centuries include S. Michele on the island of San Michele, by M. Coducci (1469–78); the façade has a curved tripartite crowning, and the interior comprises a nave and two side aisles. The adjacent Emiliani Chapel (ca. 1530), by G. Bergamasco, is a hexagonal domed structure. S. Zaccaria was founded in the 10th century. Of the earliest structure, a three-aisled crypt remains. The campanile dates from the 13th century. A. Gambello worked on the reconstruction of the church lateral chapels; the façade was completed in the early 17th century. There are polyptychs by Palma Vecchio and B. Vivarini and works by L. Bassano and Padovanino. S. Giovanni Crisostomo (1497–1504), by M. Coducci, has a Greek-cross plan, with barrel vaults and central dome on piers; there are works by Giovanni Bellini, Sebastiano del Piombo, and T. Lombardo. S. Maria dei Miracoli (S. Maria Nuova; 1481–89), by P. Lombardo, is faced inside and outside with polychrome marble; the interior comprises a barrel-vaulted nave, with a coffered ceiling, and sculptural decoration by the Lombardos. S. Giobbe was built after 1450; it was begun in Gothic style by A. Gambello and continued in Renaissance style by P. Lombardo

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

and assistants. Consecrated in 1493, the church has a single aisle, groin-vaulted, and contains works by P. Bordone, B. Vivarini, Giovanni de Alamagna, P. Lombardo, Bregno, and G. B. Piazzetta. SS. Apostoli was first erected in the Middle Ages and rebuilt in the 16th century. S. Giorgio Maggiore was completely rebuilt by Palladio and subsequently finished by V. Scamozzi. The façade has four colossal columns and a triangular tympanum. The interior has a nave and two side aisles and a domed transept and chancel. There are works by J. Tintoretto, J. Bassano, S. Ricci, and Palma Giovane. The adjoining monastery (now the headquarters of the Fondazione Giorgio Cini) was founded in the Middle Ages and enlarged and rebuilt over the centuries. The campanile dates from 1791. The Church of the Redentore, by Palladio, has a single aisle with a wide transept, intercommunicating lateral chapels, and hemispherical dome. The church has works by P. Veronese, F. Bissolo, F. Bassano, Palma Giovane, C. Saraceni, L. Bastiani, and Alvise Vivarini. Influenced by Palladio was S. Maria della Presentazione (1582), a polygonal-plan church. S. Lorenzo was remodeled by S. Sorella (1592–1617) on a square plan but left unfinished. S. Trovaso was rebuilt about 1590 in Palladian style; it contains works of M. Giambono and J. Tintoretto. S. Pietro di Castello was erected by F. Smeraldi (1596) and G. Grapiglia (1619), after designs by Palladio; the high altar and the Vendramin Chapel are by B. Longhena, and the campanile is by M. Coducci (1482–88).

Noteworthy, too, is S. Sebastiano (1544–48), by Scarpagnino, with a single aisle; there are paintings and frescoed friezes by P. Veronese. S. Maria Mater Domini is attributed to Sansovino; the interior comprises a nave and two side aisles and contains works by V. Catena, Tintoretto, Bissolo, Bonifacio de' Pitati, and L. Bregno. The medieval Church of S. Salvatore was rebuilt in the 16th century (completed by J. Sansovino); the façade was completed in the 18th century after a design attributed to G. Sardi. The interior comprises a nave and two side aisles. There are works by Titian, Sansovino, Palma Giovane, A. Vittoria, and P. Bordone. S. Giuliano was remodeled about 1555 by J. Sansovino and A. Vittoria; the square interior has a carved wooden ceiling. There are works by Palma Giovane, L. Corona, A. Vittoria, Veronese, B. Boccaccino, and Girolamo da Santacroce. S. Fantin was begun by Scarpagnino (1507–49); the chancel and apse are by Sansovino. S. Francesco della Vigna was designed by Sansovino (1534); the façade portal is by Palladio (1568–72). The Latin-cross structure has a single aisle, and there are paintings by Antonio Vivarini, Palma Giovane, Giovanni Bellini, and P. Veronese, as well as monochrome frescoes by G. B. Tiepolo. In the 15th and 16th centuries, the *scuole di devozione* (seats of the confraternities) were important art centers. Such was the Scuola Grande di S. Marco (now the Ospedale Civile), designed by P. Lombardo and G. Buora (1488–90) and completed by M. Coducci. The façade is decorated with illusionistic architectural perspectives and sculpture by T. Lombardo and B. Bon; in front of the Scuola is Verrocchio's equestrian monument to B. Colleoni. The Scuola di S. Giorgio degli Schiavoni dates from the 16th century; the façade was designed by Giovanni de Zan (1551); within there are canvases by Carpaccio. The Scuola Vecchia della Misericordia (15th cent.) is Gothic. The Scuola Nuova di S. Maria Valverde della Misericordia was begun by Sansovino (1532); the façade was left unfinished. The Scuola di S. Giovanni Evangelista was enlarged in the 15th century. The Scuola preserves paintings by D. Tintoretto, S. Peranda, D. Tiepolo, and J. Marieschi. The Scuola Grande di S. Rocco, by B. Bon, S. Lombardo, and Scarpagnino (1517–1550), is decorated with 56 canvases by Tintoretto.

Among the religious edifices built or partially rebuilt in the 17th and 18th centuries is S. Rocco, built in the 15th century by B. Bon and rebuilt by Scalfarotto (1725); the façade by B. Maccarucci is adorned with statues by G. M. Morlaiter; within the church are canvases by J. Tintoretto, F. Solimena, and S. Ricci. S. Niccolò da Tolentino was designed by V. Scamozzi (1591–1602); the pronaos was added by A. Tirali (18th cent.). The church preserves works by Palma Giovane, S. Peranda, L. Giordano, and Padovanino. S. Maria della Salute, by B. Longhena (1631–81), has an octagonal plan, with a wide chancel at one side, hemispheric dome, and a smaller dome over the chancel. The monumental façade stands at the head of a broad flight of steps leading up from the water. There are works by Titian, L. Giordano, Palma Giovane, Sassoferrato, and J. Tintoretto. The Seminario Patriarcale is by Longhena (1670). The "Dogana da Mar" (marine customs house), by G. Benoni (ca. 1667), is surmounted by bronze sculptures. The Church of the Angelo Raffaele, rebuilt by F. Contino (1618), has scenes from the story of Tobias (VII, PL. 98), attributed to G. A. or F. Guardi. The Church of the Gesuati (S. Maria del Rosario), by G. Massari (1726–43), is elliptical in plan, and there are frescoes by G. B. Tiepolo and works by G. B. Piazzetta, G. M. Morlaiter, and Tintoretto. S. Stae (façade, 1709), by D. Rossi and G. Grassi (interior, 1658), contains works by G. B. Tiepolo, G. B. Pittoni, G. B. Piazzetta, A. Balestra, and others. The Scuola di S. Gerolamo (or Scuola di S. Fantin), by A. Contino (1592–1600), has works by A. Vittoria, P. Veronese, Tintoretto, and ceiling canvases by Palma Giovane. The Church of the Ospedaletto (S. Maria dei Derelitti), by B. Longhena (1674), is decorated with early works of G. B. Tiepolo. Typical examples of Venetian baroque, particularly rich in their external ornamentation, are S. Moisè, by A. Tremignon (1668), decorated by A. Merengo; S. Maria Zobenigo (S. Maria del Giglio), by G. Sardi (1680–83); S. Bartolomeo, a medieval church rebuilt in 1723; S. Maria di Nazareth (the Scalzi), by B. Longhena (1670–80); the Church of the Jesuits (S. Maria Assunta), with façade by G. B. Fattoretto (18th cent.); S. Simeone Piccolo, built by Scalfarotto (1718–38); S. Maria della Pietà (or Church of the Visitazione; 1760), by G. Massari; and S. Vitale, with façade by A. Tirali (1700).

Among the most important civil structures of the 16th, 17th, and 18th centuries are the Palazzo Corner, called "Ca' Grande" (now the Palazzo del Governo), with two orders of paired columns on a high rusticated base, and the Palazzo Manin, by J. Sansovino; the Palazzo Grimani and the Palazzo Corner-Mocenigo, by Sanmicheli; the Lombardesque Palazzo Malipiero-Trevisan (early 16th cent.); the Palazzo Priuli (1580), by B. Monopola; the Palazzo Loredan, by Scarpagnino (1536); the Palazzo Pisani (16th–18th cent.) in Campo Pisano; and the prison, by G. A. Rusconi (1560) and Antonio da Ponte (1589), completed in 1614 by the Continos. Other edifices include the Palazzo Giustinian-Lolin (1623), by B. Longhena, the Palazzo Moro-Lin (now Pascolato), by S. Mazzoni, the Ca' Matteotti (formerly Palazzo Michiel dalle Colonne; 17th cent.), the Palazzo Contarini (formerly Corner), the Lombardesque Palazzo Grassi-Stucky, by G. Massari (18th cent.), the Palazzo Balbi, by A. Vittoria (1590), the Palazzo Papadopoli (formerly Coccina-Tiepolo; second half of 16th cent.), the Palazzo Contarini degli Scrigni (1609), by V. Scamozzi, the Palazzo Rezzonico (1660) and the Palazzo Pesaro (1710), both designed by Longhena, and the Palazzo Corner della Regina (now Monte di Pietà; 1724).

Among the buildings erected in the neoclassic period are the Teatro La Fenice, by A. Selva (1790–92); the Church of the Maddalena, on a circular plan, by T. Temanza (18th cent.); and the façade of the former Palazzo Patriarcale, by L. Santi (19th cent.). The romanticism of the 19th century fostered the creation of areas of green in front of the small palaces on the Grand Canal, as well as the construction of a number of Neo-Gothic structures. Museums include the Museo Archeologico; the Museo Marciano, adjoining S. Marco; the Treasury of S. Marco; the Mostra Permanente dei Cimeli della Biblioteca Marciana; the Museo Correr (15th-cent. Venetian painting); the Galleria Querini Stampalia (Venetian works of the 15th–18th cent.); the Pinacoteca Manfrediniana e Raccolte del Seminario Patriarcale (fragments, sculptures, and inscriptions from former churches and convents; 15th–16th-cent. Venetian works); the Gallerie dell'Accademia (collection of Venetian paintings, from the primitives to the 18th century, as well as Tuscan and Lombard works); the Ca' d'Oro (with the Galleria Giorgio Franchetti, collection of paintings, tapestries, and medals of the 15th and 16th cent.); the Ca' Rezzonico (18th-cent. paintings, furniture, objets d'art, ceramics, etc.); the Museo Storico Navale; the Museo Orientale, in Ca' Pesaro; the Museo della Congregazione dei Padri Armeni Mechitaristi di Venezia, on the island of San Lazzaro degli Armeni (with a small collection of Egyptian art, Roman objects, and Armenian miniatures and coins); and the Galleria Internazionale d'Arte Moderna.

Torcello, one of the earliest inhabited islands of the Venetian estuary, has a group of monumental edifices surrounding its piazza. The Church of S. Fosca (11th cent.), octagonal in plan, has an external colonnade on five faces and a pentagonal apse between two semicircular apsidioles with two rows of blind arches; the interior has a Greek-cross plan, with timber roof. The Cathedral was erected in the 7th century, remodeled in the 9th, rebuilt in 1008, and subsequently altered. The façade is brick, and the interior has a basilican plan, with columns of Greek marble and Corinthian capitals. There are mosaics from the 9th and 12th centuries, and the campanile dates from the 11th century. The Palazzo dell'Archivio and the Palazzo del Consiglio date from the 14th century. In Burano is the Church of S. Martino, which has a Crucifixion by G. B. Tiepolo. On the island of San Francesco del Deserto is a small church and a 14th-century cloister. Murano was a flourishing center in the 11th century and enjoyed its greatest prosperity in the 16th century. An ancient center of the art of glass-making, it is still very active. The Church of S. Pietro Martire (14th cent.), which has been rebuilt several times, contains works by G. Bellini, Tintoretto, and Veronese. The Church of SS. Maria e Donato was rebuilt in the 12th century with an octagonal apse and a double order of columns. The Latin-cross interior has 12th-century mosaic paving and a 13th-century mosaic in the apse. The campanile dates from the 13th century. S. Maria degli Angeli (1529) is a Lombardesque structure. The Palazzo Da Mula (15th cent.) is Gothic. The Museo Vetrario has a

fine collection of glass from the 15th century to the present. The Palazzo del Podestà and the Church of the Assumption in Malamocco are 15th-century structures.

Verona. As early as the Bronze Age, Verona was the site of lake dwellings. From the 7th century B.C., it was a center of Atestine culture. The Cenomani seem to have begun to enter the region in the 4th century B.C. Relations with Rome were well established as early as the 2d century B.C. (construction of the Via Postumia) and consolidated about 89 B.C., when Verona became a Roman colony. Dating from the end of the Roman Republic are the walls, rebuilt in 265 by Gallienus, while the Porta dei Borsari and the Porta dei Leoni date from the Flavian period. Other Roman remains include the so-called "Arena," a theater, the Arco dei Gavi, and a Roman bridge. The seat of various monarchies (Ostrogoths, Lombards, and Franks), Verona was devastated by the Magyars in the 10th century. Rebuilding began in the 11th century, when Verona was an independent commune. In the 14th century it became a seigniory of the Scaliger family. In 1405 it came under the rule of Venice and shared the fate of that republic.

The medieval city largely followed the outlines of the Roman city. The various phases of growth are attested by successive enlargements of the walls: in the 6th century (walls of Theodoric, of which no trace remains), in the 11th (walls of the period of the commune), in the 14th (walls of the Scaligers, remarkably well preserved). In the 16th century the medieval walls were restored and fortified by Sanmicheli and in the 19th century by the Austrians. Many of the churches date from the Early Christian period, but nearly all were remodeled in the Romanesque period and are characterized by conical-topped campaniles and wall facings of thin courses of stone and brick. Vestiges of the various building phases from the Early Christian to the Romanesque are combined in the Church of S. Stefano, which dates from the 5th century. The Church of SS. Tosca e Teuteria (5th cent.) has a Greek-cross plan. The 5th-century structure was a pagan shrine; it was consecrated in the 8th century and remodeled in the 12th.

Noteworthy Romanesque edifices include the group of buildings centering upon the Cathedral, which incorporates remains from various periods. Excavations in the cloister (1123) uncovered fragments of mosaic pavements and sculpture from an Early Christian basilica. The columns and capitals of the atrium linking the Cathedral to the Baptistery probably survive from the 8th-century Cathedral, which was rebuilt in 1139–87. The Cathedral was enlarged in the 15th–16th centuries with Gothic and Renaissance elements. Of the Romanesque structure, there remain the lower portions of the outer walls, the apses and the bay of the chancel, and nearly all of the tripartite façade with blind galleries, and the Lombard porch by Master Nicolaus (q.v.). The right flank preserves part of the Romanesque cornice decorated with hunting subjects and a porch with sculptured capitals. The circular apse is also Romanesque, and the campanile (completed by Sanmicheli in the 16th cent.) has a 12th-century base. The Gothic interior of the Cathedral comprises a nave and two side aisles. Along the side aisles are Renaissance chapels, some of which are framed by sham architecture by Falconetto. The Cathedral preserves several Renaissance paintings. The Baptistery (S. Giovanni in Fonte), rebuilt in 1123, has a nave with two side aisles and three apses. The sculptured baptismal font dates from about 1200 and reflects Byzantine influence. The Church of S. Elena (9th cent.) was rebuilt and reconsecrated in 1140. The Vescovado, behind the Cathedral, preserves vestiges of the Romanesque structure (portico; tower of Bishop Ognibene, 1162). There are Renaissance frescoes inside the Vescovado. The most distinctive Romanesque church in the city is S. Zeno Maggiore. It was erected in the 5th century and rebuilt in the 9th century by the architect Pacificus. Its present form dates from 1120–38. The upper part of the church was completed in the 12th–13th centuries; the apse was rebuilt in 1385–98; and the restoration dates from 1870. The tripartite façade, with pilaster strips, is broken horizontally by a gallery with mullioned windows. The portal with porch has column-bearing lions. The portal, by Nicolaus, is flanked by two bands of sculpture by Guillelmus (ca. 1135). The campanile dates from 1045–1178, and the battlemented tower, the sole vestige of the old Benedictine abbey, dates from the 13th–14th centuries. The interior of S. Zeno has a Latin-cross plan. The aisles are separated by alternating piers and columns with remarkable Romanesque capitals. The large statue of St. Zeno dates from the 13th century. There are numerous frescoes from the 12th–15th centuries and a triptych by Mantegna. The spacious crypt is surrounded by carved colonnades with 12th-century capitals. The octagonal baptistery dates from the 12th century. Other Romanesque churches include S. Lorenzo (early 12th cent.; restored) and S. Giovanni in Valle (9th cent.; reconsecrated in 1194; restored). S. Giovanni in Valle has frescoes from the 12th–13th centuries. In the 9th-century crypt is the 4th-century sarcophagus of SS. Simon and Jude. There are remains of the Romanesque cloister (12th cent.); the campanile dates from the 16th century. In the center of the medieval town is the Piazza delle Erbe (I, PL. 402), with remodeled houses standing on Gothic and Romanesque foundations. Also in the square is the Fontana di Madonna Verona. The statue that gives the fountain its name is Roman. In the Piazza dei Signori is the Palazzo del Comune (begun in 1193), with a single row of triple-lighted mullioned windows. The Palace is topped by the Torre dei Lamberti (1172; completed in 15th cent.). The Palazzo del Governo (formerly Reggia degli Scaligeri, late 13th cent.; restored in 1930) has a ground-floor gallery, Guelph battlements, and an interior court. The triumphal door is by Sanmicheli. The Palazzo dei Tribunali (formerly the Palazzo del Capitano) is a late-14th-century structure. Additions and alterations were made in the 15th–17th centuries. The small Romanesque Church of S. Maria Antica was founded in the 7th century, rebuilt in the 11th.

The Gothic style became established late in the 13th century, with the churches of the Dominicans and Franciscans. The Dominican Church of S. Anastasia (1291–1323) has a Latin-cross plan and chapels flanking the apse. The church preserves remarkable late-Gothic frescoes (by Altichiero, Pisanello, Turone, and Stefano da Zevio). S. Fermo Maggiore comprises an upper and a lower church, both dating from the 12th century. The upper church was rebuilt in the 13th century and has a single nave with carinate ceiling and five apses. It preserves 14th-century frescoes, a Crucifixion by Altichiero, an Annunciation by Pisanello, and the Brenzoni monument by Nanni di Bartolo. S. Eufemia (end of 13th–15th cent.) is a single-aisled church. A notable Gothic civil structure is the Castelvecchio (1354–75), which consists of two structures encircled by a moat with drawbridges. From the late Gothic period are the Scaliger tombs in the Piazzaletto delle Arche (I, PL. 380; III, PL. 21).

The work of Fra Giocondo, to whom the Loggia del Consiglio is ascribed (1475–92), marked the beginning of the Renaissance in Verona. At the end of the 15th century, Lombard masters became prominent. Michele Sanmicheli (q.v.) was responsible for several 16th-century structures, including the Porta Nuova, Porta Palio, the Palazzo Guastaverza (now Malfatti), the Palazzo Pompei, the Palazzo Canossa, the Palazzo Bevilacqua, the portal of the Palazzo dei Tribunali (formerly Palazzo del Capitano), the Pellegrini Chapel in S. Bernardino, and the decoration of the lower façade of S. Maria in Organo. Renaissance in style is the Church of S. Giorgio Maggiore (S. Giorgio in Braida; 1477–1536), which has a hemispherical dome on an arcuated drum and an altar by Sanmicheli. Noteworthy buildings with painted façades are the Mazzanti houses (dating from the time of the Scaligers), with frescoes by N. Giolfino, G. F. Caroto, and A. Cavalli, and the Gran Guardia (begun 1610). The baroque style had a moderate vogue in Verona (Palazzo Maffei, 1668, in Piazza delle Erbe). Dating from the 18th century is the Italian-style garden of the Palazzo Giusti. Museums include the Museo Archeologico al Teatro Romano, the Museo Maffeiano, the Museo di Castelvecchio (14th–18th-cent. works), the Galleria d'Arte Moderna, and the Biblioteca Capitolare (with 5th-cent. codices).

Near Verona is Bardolino, the site of the late medieval Church of S. Zeno (cruciform) and a castle built by the Scaligers. The town of San Giorgio has a Romanesque parish church, which preserves an 8th-century Lombard ciborium and remains of a small Romanesque

cloister. In San Bonifacio is the Church of S. Abbondio, a Romanesque structure with 15th-century frescoes. In Santa Sofia di Pedemonte is Palladio's Villa Boccoli (formerly Villa Sarego).

Vicenza (Lat., Vicetia). A Paleo-Venetic settlement and later a Roman municipium, Vicenza was devastated by the barbarians and was the scene of continual strife in the Middle Ages. The city flourished again under Venetian rule (from 1405) and achieved its greatest magnificence in the 16th century, when the monumental physiognomy of the city was established by Palladio. Vicenza's modern appearance dates from that time. The plan of the modern city, in

which the outlines of the ancient city are discernible, extends along a main axis (Corso Palladio) and is centered on the Piazza dei Signori. Remains of the Roman period include the ruins of a theater, cryptoporticus, bridge, and aqueduct. The Via Postumia passed through the Roman city and served as its *decumanus maximus*. Surviving from the Early Christian period is the square-plan Chapel of S. Maria Mater Domini (4th–5th cent.) adjoining the 10th-century Church of S. Felice, which was originally founded in the 5th century. Vestiges of a basilica having a nave and four side aisles with mosaic pavement have been found under the Cathedral. The tradition of the "hundred towers" of Vicenza goes back to the 11th–13th century. Towers surviving from this period include the Torre di Piazza and the Torre del Girone (called "Torre del Tormento"). There are few Romanesque remains because of the virtual destruction of Vicenza by Frederick II of Austria in 1236. The Scaligers extended the city's fortifications. In the 13th–14th century a great many Romanesque and Gothic churches were built. The Dominican Church of Sta Corona (1260), with nave and two side aisles, has a crypt and chancel by Lorenzo da Bologna (1482). The Franciscan Church of S. Lorenzo (1280–1344) has a façade with blind arches and boasts a carved marble portal by Andriolo de Sanctis. The Church of S. Maria dei Servi, with nave and two side aisles, was erected in 1407 and enlarged in 1490. A structure marking the transition from the Gothic to the Renaissance is the Cathedral, which was begun in the 14th century and completed in the 16th. The façade is attributed to Domenico Veneziano (1467). Flamboyant Gothic buildings include the Palazzo Regaù, the Casa Longhi, and the Casa Pigafetta (1481). The Palazzo Da Schio is a Gothic-Renaissance structure (early 15th cent.; partially rebuilt). Venetian Gothic palaces include the Palazzo Colleoni-Porto (14th cent.). The Palazzo Thiene was designed by Lorenzo da Bologna (1489); the unfinished courtyard and the façade are the work of Palladio. The fine loggia in the Palazzo Vescovile (1494–95) is attributed to Bernardino di Martino da Milano, who probably worked after a plan by A. Rizzo. The Church of S. Rocco is a 15th-century edifice, but the façade dates from 1530. The Church of S. Pietro in Piano was reconstructed in the 15th century. The nearby Oratory of S. Pietro (or Oratorio dei Boccalotti) also dates from the 15th century. The late-15th-century Palazzo Negri has two crenelated towers. The two Arnaldi houses are also 15th-century structures. The Palazzo della Ragione (or "Basilica"), in the Piazza dei Signori, was rebuilt by Palladio (XI, PL. 29). The original structure had been erected in the 13th century and subsequently remodeled. Among Palladio's other works in Vicenza are the Palazzo Trissino dal Velo d'Oro (attributed), the Palazzo Chiericati, the Palazzo Porto-Barbaran, and the Palazzo Valmarana, as well as the Loggia del Capitanio. (See XI, PLS. 30, 35.) The Teatro Olimpico (IX, PL. 312; XI, PL. 36), with its permanent perspective scenery, was begun by Palladio and completed by Scamozzi. The Palazzo Bonin, which is attributed to Scamozzi, is Palladian in style. Scamozzi's original creations include the Palazzo della Prefettura (formerly Palazzo Godi) and the Palazzo del Comune (formerly Palazzo Trissino; completed by A. Pizzocaro). Also in the Palladian tradition are the Palazzo Migliorini and the Casa Bortolan (16th cent.). Baroque architecture in Vicenza is represented by the works of C. Borella, who was responsible for the Palazzo Montanari (now the Palazzo della Banca Cattolica del Veneto; ca. 1680–90), the Palazzo Piovene (1676–80), and the central-plan Church of Ara Coeli (1675–80). In the 18th century, G. Massari built the Palazzo Vecchia (Romanelli, 1748), and F. Muttoni designed the new façade of the Monte di Pietà (1704). Muttoni was also responsible for the Palazzo Repeta (now Banca d'Italia; 1701–11). A more resolute return to Palladian classicism is represented by the Cordellina (1776) and the Zileri Dal Verme (1782) palaces, by O. Calderari, and the Pagello (1780) and Folco palaces (1770), by O. Bertotti-Scamozzi. Neoclassic traits are evident in the façade of the Palazzo Vescovile (1819), by G. Verda, the Palazzo Franco (1830), by A. Piovene, and the cemetery, by B. Malacarne and G. Verda. The Museo Civico (in the Palazzo Chiericati) has an archaeological collection with prehistoric materials; there is also a painting gallery. The Biblioteca Comunale Bertolina has a collection of rare codices and incunabula.

Near Vicenza is the villa by Palladio called "La Rotonda" (XI, PL. 31). A central-plan structure, it has four porches with Ionic columns and pediments. Not far from "La Rotonda" is the 18th-century Villa Valmarana, which contains frescoes by G. B. Tiepolo and his son Giovanni Domenico. The Church of Monte Berico (1688–1703), by C. Borella, also near Vicenza, has a Greek-cross plan and is surmounted by a dome. In the refectory is the *Feast of Gregory* by Paolo Veronese.

Vittorio Veneto. Created by the union of Serravalle and Ceneda (1866), Vittorio Veneto was named in honor of Victor Emmanuel II, the first king of Italy. Part of the medieval fortifications of Serravalle survive. There are porticoed Gothic buildings as well as interesting Renaissance structures. The Palazzo Comunale di Serravalle, or Loggia Serravallese (15th cent.), preserves a Romanesque tower and portico. The Church of S. Lorenzo (with 14th-cent. frescoes) is incorporated in the Ospedale Civile (14th cent.). S. Giovanni Battista has a Romanesque Gothic façade (1267) and a portal dating from 1483. The parish

church of Bigonzo (S. Andrea) was rebuilt early in the 14th century. S. Giustina (rebuilt in the late 16th cent.) houses the tomb (1336–40) of Rizzardo VI da Camino. The Cathedral of Serravalle was rebuilt in 1775; in the interior is a Madonna and Child with Saints by Titian. The Museo del Cenedese is in the Loggia Serravallese.

The Church of S. Maria di Meschio preserves an Annunciation by A. Previtali. The Cathedral of Ceneda, built in 1740–73, has retained its Romanesque campanile, which was built as a defense tower for the Castle of S. Martino. The former Palazzo Comunale, or Loggia Cenedese, was erected in 1537–38. The Castle of S. Martino, now the Sede Vescovile, was rebuilt in the 15th century. The Sanctuary of S. Augusta has a small Gothic portico.

The Abbey at Follina, southwest of Vittorio Veneto, was founded in the 12th century.

Friuli-Venezia Giulia. Much of the history of this region is that of the entire Venetian area (see above, *Veneto*). The development of the culture of the *castellieri*, a kind of stone enceinte, was an early historic phenomenon peculiar to the mountainous territories of the Carni and Histri. The city of Aquileia was an influential center of civilization from the time of its foundation, in the 2d century B.C., until the Middle Ages, when the influence of Venice dominated the region. Most of Istria is now part of Yugoslavia (q.v.).

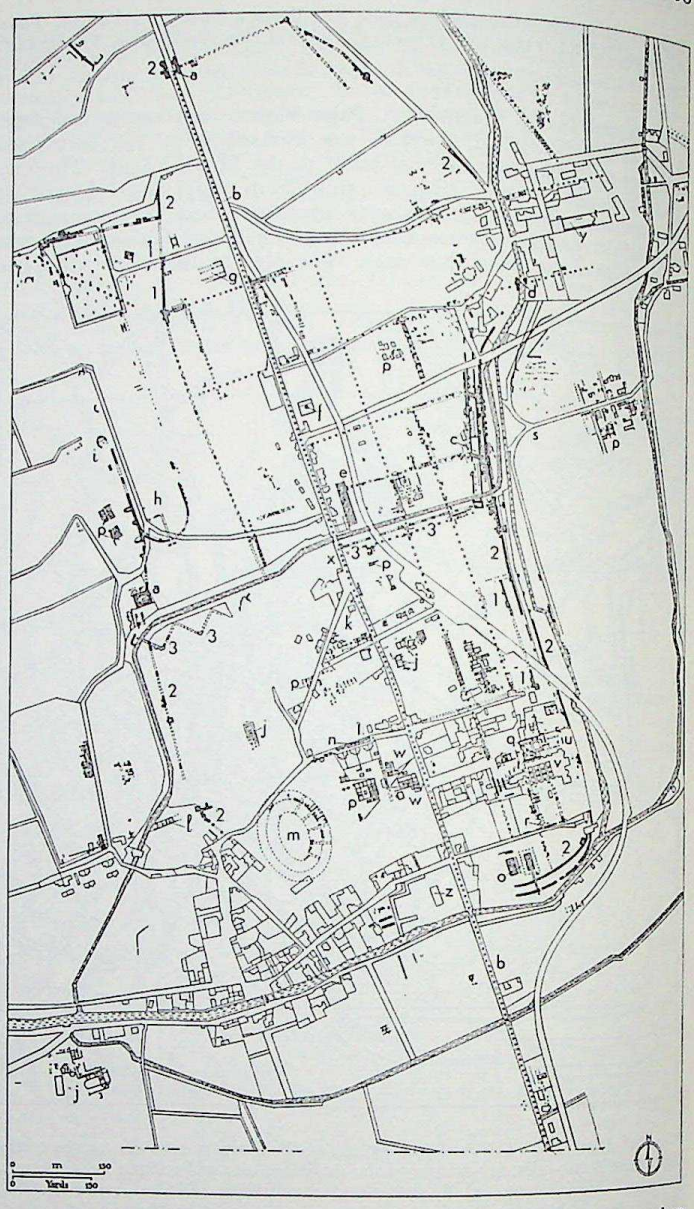
Aquileia. The Latin colony of Aquileia was founded in 181 B.C. and enlarged in 169 B.C. Later it became a municipium and an important center of trade and industry. Aquileia is laid out with streets intersecting at right angles. The Roman port installations along the Natissa River canal have been brought to light, as have the vestiges of the republican and imperial walls, the forum, houses with mosaic pavements, suburban villas (with statues and mosaics), a thermal establishment, an amphitheater, and tombs.

Devastated by the barbarian invasions in the 5th century, Aquileia rose again as the seat of a patriarchy. It reached its zenith in the 11th century, when the canal linking it with the sea was reopened, the Cathedral rebuilt, the patriarchal palace and campanile erected, the walls restored, and a large number of monasteries founded in the immediate vicinity. There was some building activity in the 14th century, but subsequently malaria, the Austrian occupation (1509), and the abolition of the patriarchate (1751) marked the decline of Aquileia. The sole witness to Aquileia's former splendor is the Cathedral, with its massive campanile, rebuilt under the auspices of the patriarch Poppo (1019–42). In the 4th century two religious chambers were erected. The northern chamber was converted into a basilica and, in the second half of the 4th century, replaced by a larger structure with a baptistery. This structure was destroyed by the Huns in the 5th century, and only the splendid mosaic pavement (near the present campanile) remains; the southern chamber (*cathecumeneum* and *consignatorium*) was also converted into a church, but it was replaced by a basilica with baptistery, which, having collapsed in the 10th century, was rebuilt and completed by Poppo (1031). The present Romanesque building is preceded by a fragmentary portico (9th cent.; built of material from earlier structures) and has a basilican plan with elevated choir. The pointed arches and carinate ceiling date from the restoration following an earthquake in 1348. Dating from the 11th century are the apse frescoes and the circular Holy Sepulcher, of simple ashlar masonry, with an attic on small columns and a conical roof. The Cripta degli Scavi may date from the 5th-century church. A portico and the so-called "Church of the Pagans" (frescoed rectangular room, 13th cent.) link the Cathedral with the Baptistery (in ruins), which was



Aquileia, plan of the Roman and medieval city (laid out over the modern plan). Dotted lines indicate the probable layout of the old streets. Cividale del Friuli (Lat., Forum Julii). In antiquity the site marked a point of encounter between Venetic and Celtic peoples. Forum Julii was so named in honor of Julius Caesar; it became a municipium either in 49 B.C. or in the Augustan age. A hypogeum of the Celtic period had been discovered. Traces remain of a wall of the Roman republican period and of a later wall, possibly of the 2d century of our era. A forum was found beneath the modern Piazza del Duomo, with traces of a single-aisled basilica. Houses with mosaic pavements (1st–2d cent. of our era), baths, and villas in the nearby countryside also survive. An episcopal seat from the 5th century, Forum Julii acquired considerable importance under the Lombards. It was destroyed by the Avars in 620 but was reestablished as Civitas Forumiuliana. In the 8th century its name was changed to Civitas Austriae, and the town became the seat of the patriarch of Aquileia, who exercised temporal jurisdiction there until 1031. In the 16th century the town declined. A necropolis dating from the barbarian period yielded rich finds (e.g., fibulas and plaques). Remains from the 8th century include the Altar of Ratchis (VII, PL. 373) and the octagonal aedicular baptistery (both in the Cathedral). The Tempietto (or Oratory of S. Maria in Valle), a rectangular hall covered by barrel vaults and terminating in a triapsidal presbytery, also dates from the 8th century. The oratory is decorated with fine stuccoes, variously dated between the 8th and 11th centuries, and wall frescoes of the 11th century; the wooden choir stalls date from the 14th century. The other medieval churches have, for the most part, been remodeled. The Cathedral was begun in 1453 and completed in mid-16th century by Pietro Lombardo; the façade is adorned with three ogival portals. The nave is covered with a barrel vault. The Cathedral has a silver altar frontal from the 12th century and a 13th-century wooden crucifix, as well as works by Palma Giovane and M. Ponzone. The Church of S. Maria dei Battuti has a Renaissance presbytery and a triptych by Pellegrino da San Daniele. The Museo Archeologico Nazionale contains barbarian and medieval gold- and silverwork and illuminated manuscripts, as well as archaeological finds.

Gemona. Mentioned by Paulus Diaconus under the name of Castrum Glemonae, it was a dependency of the patriarchate of Aquileia and enjoyed its greatest prosperity in the 13th century. Gemona is dominated by the ruins of the ancient castle (of which two towers survive). The Cathedral (13th–14th cent.) was designed by Giovanni Griglio of Gemona. The façade (restored in the 19th cent.) has an arcade with statues and three rose windows; the Gothic interior comprises a nave and two side aisles. S. Giovanni preserves Romanesque vestiges; the coffered ceiling is the work of P. Amalteo (1533). The Palazzo del Comune has Lombard Renaissance features (1505). The Church of S. Maria delle Grazie preserves a Madonna by Cima da Conegliano (1494) and a Holy Family by G. F. da Tolmezzo (1510). There is a collection of paintings in the Palazzo del Comune.

BIBLIOG. G. Bragato, Da Gemona a Venzone, Bergamo, 1913; I. Giuliani, Il Convento e la chiesa di S. Maria delle Grazie in Gemona, Venice, 1942; G. Marchetti, Gemona e il suo mandamento, Udine, 1958.

Gorizia. First mentioned in 1001, Gorizia was the fief of the counts of Gorizia until 1420, when it passed to Austria. The town lies at the foot of the castle built by the counts of Gorizia, which was enlarged by the Venetians in the 16th century. Among the edifices inside the walls is the Palazzina dei Conti (12th cent.). The Cathedral was built in the 14th century, damaged during World War I, and rebuilt in 1927. There are remains of the medieval structure in the apse. The Cathedral Treasury contains objects from the Basilica of Aquileia. The Church of S. Ignazio (1680–1725, restored) is a baroque structure. Gorizia contains many houses and palaces showing Venetian influence. The 18th-century fountain with Neptune and naiads was designed by Nicolò Pacassi. Museums include the Museo Storico Provinciale (minor arts, archaeological collection) and the Galleria d'Arte.

BIBLIOG. A. Morassi, Chiese gotiche in Val d'Isonzo, Architettura, II, 1922–23, pp. 177–89; A. Morassi, Gorizia nella storia dell'arte, Gorizia, 1925; A. Grado. On a small island between the lagoon and the sea, Grado developed as a port closely linked with Aquileia by means of the Natisone. In the imperial age Grado was a resort for the wealthy of Aquileia. On the nearby island of Gorgo, the ruins of a country villa with mosaics have come to light. Grado enjoyed a period of great prosperity in the 6th century, when the schism in the patriarchate of Aquileia began, and Grado, too, had a patriarch. Grado's decline began in the 11th century. In the 20th century Grado has become a bathing resort, with broad, regularly laid out streets, but it still retains virtually intact the ancient medieval center. Grado's Early Christian buildings are particularly noteworthy. S. Maria delle Grazie, built in the 5th century and rebuilt toward the end of the 6th century, preserves part of the 5th-century mosaic pavement. The Cathedral, basilican in form, was built in the 6th century, over an earlier structure. (Remains of the Church of S. Eufemia lie under the present floor.) The Cathedral was remodeled in later centuries and recently restored. In addition to the mosaic pavement and contemporaneous choir enclosure, the Cathedral has a 14th-century ambo built of Roman and late medieval remains. The ambo has a Gothic-Moorish cupola. The Cathedral also preserves a silver reredos from the 14th century. The Cathedral has a fine treasury. The octagonal Baptistery (mid-5th cent.; restored) has spacious round-headed windows and vestiges of contemporaneous mosaic pavement. The small altar has a hexagonal front. Between the Baptistery and Cathedral are remains of a *cella trichora* with reconstructed outer walls, now used as a lapidarium.

Pordenone (Lat., Portus Naonis). An Austrian possession from 1029 to 1508 (when it passed to Venice), Pordenone is characterized by Gothic and Renaissance houses, with arcades and exterior frescoes. The Palazzo Comunale (1291; enlarged in the 20th century) has a Renaissance tower built after designs by P. Amalteo (1542). The 15th-century Cathedral was built on the site of an earlier structure. The unfinished 19th-century façade has a Renaissance portal. The Cathedral preserves frescoes and canvases by Pordenone. The Cathedral Treasury has some fine reliquaries of the 13th–16th centuries. The Romanesque Church of the Trinità has a brick dome and an octagonal campanile (16th cent.). The Campanile of S. Giorgio is shaped like a Doric column (early 19th cent.). The local art gallery is in the Palazzo Comunale.

BIBLIOG. V. Candiani, Pordenone, Pordenone, 1902; A. Benedetti, Breve storia di Pordenone, Pordenone, 1956; V. Muzzatti, Guida di Pordenone, 3d ed., Pordenone, 1956.

Spilimbergo. This town was formerly the seat of the Counts of Spilimbergo, who built the castle (14th–15th cent.). The castle comprises a group of extensively remodeled structures, one of which is Gothic, with frescoes, and the others Renaissance. The Cathedral (begun 1284) is in Romanesque-Gothic style and has a Romanesque crypt. The portal on the left flank is Romanesque and has sculputred decoration by Zenone da Campione (1376). Within the Cathedral are canvases by Pordenone and wooden choir stalls by Marco Gozzi of Vicenza.

Trieste (Lat., Tergeste). The chief city of Venezia Giulia, Trieste is on the eastern shore of the Adriatic, at the foot of the Carso. Trieste was the site of a prehistoric *castelliere* settlement, later a trade center, and then an Augustan colony. The city was particularly prosperous in the Flavio-Trajanic period. There are traces of the Roman walls (perhaps Augustan), vestiges of a gate (probably late-Augustan), a temple (perhaps the Capitolium) dating from the Claudian period, a theater and the forum area with double-apsed basilica from the Trajanic period, remains of the Roman port, and traces of the network of the city streets of the western slopes of the hill of S. Giusto. After being subject to various barbarian lords, Trieste became a free commune. Fought over by Venice and Austria, it sought unceasingly to maintain its independence. The old town, with its narrow winding streets, extends along the foot and up the hill of S. Giusto, where a rectangular Early Christian basilica of Istrian type was erected in the 5th century; there are remains of the original mosaic pavement. The present Cathedral developed from two flanked churches: the Church of the Assunta (11th cent.) and that of S. Giusto, both having a nave and two aisles. The result of the fusion of the two structures was a church with a nave and four side aisles, subsequently altered. The Cathedral ends in a deep apse (remodeled in 1933) flanked by two smaller apses (the one at the left with 13th-century mosaics of the Venetian school). The fortified campanile (enlarged in 1337) incorporates a Roman structure. S. Silvestro (11th cent.) is rectangular in plan and has a small campanile to one side. The Castle of S. Giusto was built in the late 14th century and enlarged by the Venetians in the 16th century. The modest specimens of Renaissance structures in Trieste include the 16th-century Palazzo Marenzi. The chief port of the Austro-Hungarian empire, Trieste was enriched in the 18th century with civil structures characterized by splendid portals, arcades, and arches on the roofs. Building activity continued during the 19th century with a series of neoclassic edifices, among them S. Nicolò dei Greci (1786–1819), the Palazzo Carciotti (1800), and the Teatro Verdi (1801), all by G. N. Pertsch. The Borsa Vecchia (Old Exchange) was by A. Mollari (1806). The Church of S. Antonio da Padova (or S. Antonio Nuovo) was built in 1849 by P. Nobile. The Lloyd Triestino building, by E. von Ferstel, dates from 1880–85. The Neo-Gothic Evangelical Church (1875) and Palazzo Diana are also 19th-century structures. Of interest are the Serbo-Illyric Church of S. Spiridione (C. Maciachini; 1868), the Synagogue (1910), and the Scala dei Giganti (Giants' Staircase) by R. and A. Berlam, and the Faro della Vittoria (Victory Lighthouse; 1927) by A. Berlam. The University was designed by R. Fagnoni and U. Nordio (1947). Museums include the Museo Civico di Storia e d'Arte, the Orto Lapidario, the Galleria d'Arte Antica, the Museo Civico del Castello di S. Giusto, the Museo Sartorio, the Museo Revoltella-Galleria d'Arte Moderna, and the Museo Morpurgo. Just outside Trieste is the Castello di Miramare (C. Junker, 1856–60) with its park.

Marini, Andrea Pozzo e Santa Maria Maggiore a Trieste, Emporium, CXXXIII, 1961, pp. 199–208.

Udine. The capital of Friuli developed around the local castle, mentioned in 983 but surely of earlier origin. Fief of the patriarch of Aquileia, who chose it as his seat in the 13th century, Udine was a theater of conflict for more than two centuries, until it fell under the dominion of Venice (1420). Udine has a Venetian aspect, with typical arcaded houses that have mullioned windows. S. Maria di Castello was remodeled in the 13th century; the Romanesque interior has a nave and two side aisles and three apses (fresco from 1200). The 16th-century façade shows Lombard influence. The Church of S. Francesco is a restored 13th-century structure. The Cathedral (13th–14th cent.) was remodeled in baroque style (18th cent). Of the 13th-century structure (overlying an older building) it retains the middle portal and that of the campanile (overlying the former octagon of the baptistery). The crossing and chancel are by D. Rossi, and there are frescoes by L. Dorigny. The Cathedral preserves the tomb of the Blessed Bertrando, with sculptures (1345); an altarpiece and frescoes by G. B. Tiepolo; and an organ, with paintings by Pordenone and Amalteo. The Piazza Vittorio Emanuele II (formerly Piazza Contarena) with its pointed-arch loggia, after designs by Niccolò Lionelli (1456), is extremely harmonious. The Loggia of S. Giovanni, by Bernardino da Morcote, has a clock tower after designs by Giovanni da Udine (1527). The small Church of S. Giovanni is also by Bernardino da Morcote. The Bollani Arch is ascribed to Palladio. S. Giacomo, built in the 14th century, has Renaissance and baroque additions. The castle (restored) was rebuilt by G. Fontana (1517) over the ruins of the patriarchal castle. The hall of the Friuli Parliament in the castle was decorated by G. B. Grassi and S. Secante (16th cent.) and G. B. de Rubeis (18th cent.). S. Cristoforo has a portal by Bernardino da Bissone (1518). The baroque Church of the Zitelle (1610) has works of Maffeo da Verona, M. Vecellio, and S. Peranda. The Palazzo della Frattina dates from the 16th century. The Palazzo Antonini, now the Bank of Italy, was built after designs by Palladio but left unfinished. The Monte di Pietà was built in 1690. The Palazzo della Provincia (late 17th cent.) has frescoes by G. Quaglia (1698). The Manin Chapel has sculptures by Torretti (18th cent.). The Palazzo Arcivescovile has frescoes by G. B. Tiepolo, stuccoes by G. Mengozzi-Colonna, and a hall decorated with grotesques by Giovanni da Udine. The Oratorio della Purità has frescoes by G. B. Tiepolo; the monochrome murals are by Giovanni Domenico Tiepolo (1759). The remodeling of the Church of the Madonna delle Grazie (original structure dating from the 15th cent.) dates from the 19th century. The Church of the Redentore (18th cent.) has a neoclassic façade (1838). S. Pietro Martire, rebuilt in the 19th century, preserves Romanesque vestiges. The Palazzo Kechler was designed by G. Japelli (1833). The Palazzo degli Uffici Municipali was begun in 1911 after designs by Raimondo d'Aronco of Udine. The Museo Civico e Galleria d'Arte Antica e Moderna is housed in the castle.

Liguria. The coastal caves of the Riviera di Ponente were extensively inhabited in prehistoric times and have preserved remains of paleolithic and neolithic civilization and art. The territory of the ancient Liguri, for whom the region is named, formerly extended north of the Apennines to the Po; limited traces remain (e.g., anthropomorphic steles from the region of Luni). In antiquity and in the Middle Ages, Liguria was open to maritime contacts and at the same time linked to Tuscany and to Provence. Elements of Provençal Gothic were assimilated by the local Romanesque style, which was essentially Lombard. Since the Renaissance, there has been no lack of local contributions to architectural and painting styles. The narrowness of the territory, in a land of coasts dropping steeply down to the sea, has strongly influenced the layout of the cities and the form of the civil buildings, which tend to be taller and narrower, with open arcades. Also characteristic are the minor architectural works, such as villas and inns.

Albenga (Lat., Albingaunum). The chief center of the Liguri Ingauni, the town was conquered by the Romans in 181 B.C. and later became a municipium; the original urban plan of regularly laid blocks is still discernible. Ancient remains include a small amphitheater, an aqueduct, and a funerary monument (the so-called "Pilone") from the 2d century of the Christian Era. A Byzantine city until the 7th century, Albenga remained an episcopal see until the 12th century, when it became an independent commune. It passed under the domination of Genoa in the 13th century. Towers and dwellings survive from the medieval city. Dating from the early 5th century is the Baptistery (now part of the Civico Museo Ingauno). In one of the eight niches is a nonfigural mosaic from the 5th–6th century. There are

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

remains of an immersion pool, transennas, and openwork windows from the 8th century. The Cathedral, several times restored, retains 11th- and 13th-century elements. The portal and interior are baroque, and the dome has been restored. The bishop's palace, remodeled, has a 12th-century corner tower. The Palazzo del Comune (13th cent.; remodeled in 1387–91) has a ground-floor arcade (1421) and a late-13th-century tower. The 13th-century Torre and Casa Cazzulini are characteristic red-brick structures with stone bases. The Palazzo Del Carretto di Balestrino is a typical aristocratic Ligurian dwelling of the 16th century. Museums include the Civico Museo Ingauno and the Museo Navale Romano.

Genoa (Lat., Genua; It., Genova). Capital of the Genuates in pre-Roman times, Genoa was an important trade center by the 5th century B.C. The city was rebuilt by the Romans in 203 B.C. after the Carthaginian devastation of 205 B.C. There are remains of the earliest settlement on the slopes of the Castello hill, as well as a pre-Roman cemetery dating from the 5th–3d century B.C. The Roman excavation area has the structure peculiar to the castrum. Many Roman sculptures and sarcophagi survive, several of which are incorporated in the walls of churches. During the early Middle Ages, under the successive domination of the Byzantines, Lombards, and Franks, the territory of Genoa proably did not extend beyond the limits of the Roman oppidum. Only in the 10th century, apparently, was the city surrounded by new walls. Reliable evidence of the town's expansion in the 12th century are the walls dating from 1155, which enclose the various regions that overlook the sea and are arranged roughly in the form of an amphitheater. A third set of walls was added in 1546 and another in 1630, with monumental defense works, parts of which are still standing. Chiefly because of modern industrial expansion and the intensive activity of the port, the city has also annexed the suburban districts to the east.

The medieval city and its numerous monuments are virtually enclosed within the 12th-century walls, of which the Porta Soprana and Porta dei Vacca survive. Notable medieval edifices that have preserved their original structures include several churches. Traces of construction erected prior to the 11th century survive in few structures, and almost all of these were remodeled in the 12th century; several have undergone successive alteration. Among these churches are SS. Cosma e Damiano, S. Maria di Castello, S. Stefano, S. Maria delle Grazie, S. Maria delle Vigne, and S. Donato. Of the Benedictine Convent of S. Andrea, only the cloister survives (early 12th cent.; rebuilt). The most flourishing period in Genoese building extended from the 12th to the 13th century, when the attainment of full independence and economic prosperity allowed the leading families to undertake the construction of religious and private buildings. In 1118, the rebuilt Cathedral (S. Lorenzo) was consecrated. The rebuilding was begun in the 11th century, and construction continued through several centuries. The façade (restored in 1934) shows Pisan influence in the narrow bands of black and white marble. Of French derivation are the portals with their sharp-pointed arches, deep splay, and sculptural decoration. (The upper portion of the façade, less homogeneous, is from different epochs.) The dome was built after designs by G. Alessi. Off the side aisles are chapels added over the centuries, including the Chapel of S. Giovanni Battista, by Domenico and Elia Gaggini, with sculpture by M. Civitali and A. Sansovino. Dating from 1138 is the Church of S. Luca, which was rebuilt in 1626. S. Maria del Prato (1172) was remodeled in the 15th century and later. The Church of S. Matteo was founded in 1125, and the black-and-white striped façade dates from 1278. Particularly noteworthy is the adjacent 14th-century cloister, attributed to a certain "Magister Marcus Venetus," whose name appears on a sculptured capital. In the 13th–14th century, a number of churches were built for the monastic orders, including the Church of S. Agostino (1260), which now houses the Museo Civico d'Architettura e Scultura Ligure. Of the original Church of S. Francesco (1324–87), only the portal with tympanum has been preserved in subsequent remodeling (15th and 17th cent.). The Palazzo del Comune was begun in 1291, and the Torre del Popolo was added in 1307. The remains of the Palazzo del Comune are incorporated in the Ducal Palace. A number of aristocratic residences of the period survive, including the Lamba Doria houses (13th cent.; restored in 1951), the Torre degli Spinola (13th cent.), remains of the Palazzo Fieschi Maruffi, and the Palazzo S. Giorgio (1260; extensively remodeled and enlarged in the 16th century and restored in the 19th). Gothic traits persisted in 15th-century architecture, which continued the tradition of white-and-black striped façades with multipaned mullioned windows. Toward the middle of the century, frequent restorations and remodelings were carried out in the medieval districts; galleries and arcades were closed, façades were plastered and frescoed, and Renaissance portals decorated with the likeness of St. George were erected. Noteworthy in this connection are the house of Andrea Doria (1486) and the Palazzo Spinola in the Vico della Scienza. In the 16th century it became a popular practice to fresco building façades. The latter half of the century saw extensive undertakings in city planning. In 1550 the Via Nuova (mod. Via Garibaldi) was opened. The street is lined with monumental palaces, largely after plans by Alessi or later architects inspired by him. These palaces are generally severe on the exterior, but scenographic effects were attempted in the construction of the courtyards, and the interiors are adorned with rich stucco and fresco decoration. Among the more important buildings in the Via Garibaldi are the Cambiaso (1565), Gambaro (1565), Parodi (1567), Carrega Cataldi (1558), Doria (formerly Spinola; 1563), Podestà (1583), Cattaneo Adorno, and Serra palaces, as well as the Palazzo Municipale (Palazzo Doria Tursi; 1564). Also in Via Garibaldi are the Palazzo Rosso ("Red Palace"; 1672–77) and the Palazzo Bianco ("White Palace"; 1565). Both palaces now house painting galleries. Other 16th-century edifices include the Palazzo della Meridiana and the Palazzo Belimbau (formerly Negrotto-Cambiaso). Examples of 16th-century religious architecture, also largely influenced by Alessi, include S. Maria Assunta di Carignano (begun, 1552), S. Siro (rebuilt, 1613), S. Maria Maddalena, S. Bartolomeo degli Armeni (rebuilt, 1595), and S. Nicola da Tolentino (1597). An important part of 16th-century building activity in Genoa was the construction of suburban villas, usually two-storied structures with loggias and towers. The villa gardens were adorned with grottoes, triumphal arches, small lakes, and statues. The Cambiaso (1548), Pallavicino delle Peschiere (1560), and Scassi (formerly Imperiale; 1560) villas are by Alessi. Other villas of the period, many of which were modeled after Alessi's villas, include the Villa Bombrini and the Villa Imperiale (formerly Cattaneo, ca. 1520), as well as the Villa Doria and the Villa Rostan in surburban Pegli. Among the rather severe 17th-century buildings in Via Balbi (which was opened early in the century) are the Palazzo Balbi Senarega, the Palazzo Durazzo Pallavicini, and the Palazzo dell'Università (1634–36), all designed by B. Bianco. The Royal Palace was built about the middle of the 17th century, after designs by P. F. Cantone and A. Falcone, and restored in the 19th century. The Church of S. Carlo also dates from the first half of the 17th century. Building activity was less intense in the second half of the 17th century and throughout most of the 18th century. Dating from this period are the Albergo dei Poveri (1655) and the churches of the SS. Annunziata, S. Maria della Consolazione (1681–1706), S. Filippo Neri (1712; several times enlarged), and S. Torpete (1733).

During the 19th century, the city was transformed by the neoclassic work of C. Barabino, who in 1825 opened the Via Carlo Felice (now Via XXV Aprile), erected the Carlo Felice Theater (now Teatro Comunale dell'Opera; 1828) and Palazzo dell'Accademia Ligustica di Belle Arti (1831), laid out the Giardino dell'Acquasola, and planned the Via Assarotti, on which, in the late 19th century, was built the Neo-Renaissance Church of the Immacolata. Late-19th and early-20th-century developments include the creation of Via XX Settembre (1892), the erection of the Ponte Monumentale (1895), which crosses over the street, and the construction of several palaces, including the Palazzo Pastorino, by G. Coppedè. Around 1930, M. Piacentini supervised the arrangement of the Piazza della Vittoria, with its Arco ai Caduti (a monument to the war dead). Other modern architectural undertakings include the Ansaldo housing project (architect: R. Morozzo della Rocca; 1959–60).

Museums include the Galleria di Palazzo Bianco, the Galleria di Palazzo Rosso, the Museo Civico dei Monumenti Genovesi (in the former Church of S. Agostino), the Museo d'Arte Orientale "Edoardo Chiossone," the Galleria del Palazzo Reale, the Museo Civico di Archeologia Ligure (in the Villa Durazzo Pallavicini, Pegli), the Galleria Nazionale di Palazzo Spinola, the Museo dell'Accademia Ligustica di Belle Arti, the Raccolte di Palazzo Tursi (in the Palazzo del Comune), and the Galleria Civica di Arte Moderna.

Luni (Lat., Luna). A Roman colony was founded on the site in 177 B.C., and Luni was particularly important in the imperial age because of its port and the nearby marble quarries. With the abandonment of the quarries in the 4th century of our era Luni entered a period of decline. The raids of the Lombards and Normans in the 9th century and the silting up of the port completed Luni's ruin. The regular

UP State Museum, Lucknow

plan of the streets is still discernible. Parts of the walls remain, as do portions of the streets, baths, a theater inside the walls, and a well-preserved amphitheater from the age of the Antonines. Other finds include pediment reliefs (Florence, Mus. Arch.) dating from the 2d century B.C. There are ruins of parts of the Romanesque Cathedral of S. Maria (three apses and the campanile). Near the Cathedral is the Antiquarium Lunense.

Noli. Founded in Roman times, Noli developed during the Byzantine period and enjoyed its greatest importance in the 13th and 14th centuries, when it was a free commune and the seat of a diocese. The surviving walls, with towers and gates (13th cent.), surround typical medieval houses and palaces. Noteworthy is the Romanesque Church of S. Paragorio (11th cent.; restored in 19th cent.). The nave is covered by a ceiling with exposed beams, while the two side aisles are vaulted. The church has a monumental wooden crucifix of uncertain date (13th cent.?) and a 13th-century episcopal throne. The Cathedral was erected in the 13th century and remodeled in the 17th. The Torre del Comune also dates from the 13th century.

Near Noli are the ruins of the 12th-century Castello Ursino.

Bibliog. B. Lamboglia, La città di Noli, Savona, 1885; F. Noverasco, Noli e il suo S. Paragorio, Per l'arte sacra, II, 1925, pp. 11–14.

Portovenere. The town was built by the Genoese between 1113 and 1161 at the foot of Castrum Vetus and fortified against the Pisans. The only surviving vestige of Castrum Vetus is the Church of S. Pietro, which was erected in the 6th century and enlarged in Gothic style in the second half of the 13th century (restored in 1935). The original structure has a rectangular plan and semicircular apse (remnants of marble floor). The façade of the church is decorated with black and white marble bands. In Portovenere is S. Lorenzo (1131), several times remodeled and restored (1938), with treasury. The castle (Castrum Superior) dates from 1113 but was rebuilt in the 16th century.

On the island of Palmaria are ruins of the Abbey of S. Venerio (mid-11th cent.). The interlaced arches of the cloister reveal Arabo-Siculan influence.

Bibliog. P. F. Ferro, La chiesa di San Pietro Apostolo in Portovenere, La Spezia, 1930; U. Formentini, Monumenti di Porto Venere, La Spezia, 1940; G. Imbrighi, Porto Venere, La Spezia, 1955; G. Devoto, Porto Venere, Turin, 1958.

Sarzana. First documented in 963, Sarzana was a fief of the bishops of Luni until the early 14th century. In the 16th century it passed to the Republic of Genoa. The Romanesque Church of S. Andrea has been remodeled several times but preserves some traces of the original construction. The Cathedral was begun in 1204 and completed in 1474. The Gothic Church of S. Francesco, extensively remodeled, contains a tomb by Giovanni di Balduccio. The Fortress of Sarzanello, with its keep and round corner towers, is just outside the town.

Savona (Lat., Savo). This city of the Liguri was mentioned during the Second Punic War. A bridge from the Roman period survives. Savona enjoyed its greatest prosperity in the Middle Ages under the D'Aleramo family. The original construction of the port and the Torre del Brandale, a massive structure in compact masonry, date from the 12th century. Dating from the 13th century is the Palazzo degli Anziani. The Renaissance Palazzo Della Rovere was built after designs by Giuliano da Sangallo. The Oratory of S. Maria di Castello was reconstructed in the 17th century and restored in the 19th. The Cathedral was built in 1589–1603 and has a 19th-century marble façade by G. Calderini. The Pinacoteca Civica is in the Palazzo Pozzobelli.

A few miles from Savona is the Sanctuary of Nostra Signora di Misericordia (16th cent.), the work of Lombard architects. Nearby is the Museo del Santuario di Nostra Signora di Misericordia.

At Vado Ligure are remains of the ancient Vada Sabatia (founded 2d–1st cent. B.C.).

Ventimiglia (Lat., Albintimilium). Of pre-Roman origin, this was the home of the Liguri Intemeli and later a Roman municipium. It was devastated during the struggles between Otho and Vitellius. The ruins of the ancient city, east of the modern town, include walls, a well-preserved theater, and thermal installations. During the early Middle Ages, Ventimiglia was repeatedly devastated by the barbarians. A free commune in the 12th century, it was later partitioned between the Republic of Genoa and the Count of Provence. The Cathedral dates from the 11th century but has additions from the 12th century (apses, dome) and the 13th (façade portal). The contemporaneous Baptistery may have been built over an earlier structure. The Baptistery, which is octagonal, preserves an immersion pool from 1100. S. Michele was built in the 10th century and subsequently reconstructed. The crypt has Roman columns. In the 12th century, when Ventimiglia enjoyed its greatest prosperity, it was girdled with walls, parts of which still exist. The Museo Archeologico Girolamo Rossi contains archaeological material from Albintimilium.

At Grimaldi (near the French border), in the district known as the Balzi Rossi, are caves and rock shelters preserving prehistoric material from the Paleolithic to the Mesolithic period. The earliest deposits (among the most important in Europe) have been found in three caves — the Grotta del Principe, the Barma Grande, and the Caverna dei Fanciulli. (In the last-named cave were found bodies, with Negroid features, interred in a crouching position.) In the upper strata of the deposits in the Barma Grande, and apparently, in the Grotta del Principe, were found a number of statuettes known as the Grimaldi "Venuses."

Emilia and Romagna, including the Republic of San Marino. (*a*) *Emilia and Romagna.* Although the name of Emilia (from the Via Aemilia, which traversed the region lengthwise at the foot of the Apennines and along which the principal cities were located) is applied officially to the entire region, actually the eastern portion retains the medieval name of Romagna (Romania). Always a corridor for movements of people, an integral part of the Po plain, fronting on the Adriatic, linked with Tuscany by numerous passes, it has witnessed a wide range of important historic, cultural, and artistic developments. Besides the prehistoric traces, including such art works as the "Venuses" of Savignano and Chiozza, there are remains of the Apennine bronze culture, the Villanovan iron culture, and Etruscan centers with strong Greek influence (through the port of Spina in particular). The imperial Roman civilization everywhere left impressive monuments (e.g., Rimini) along with works showing local characteristics (mosaics, tomb sculptures). At the end of the antique period and the beginning of the Middle Ages Ravenna produced its splendid works of architecture, mosaics, and sculpture, blending Roman Christian tradition and Byzantine influences. Emilia later became one of the major centers in the development of Italian Romanesque, in direct touch with Lombardy; equally important were the developments in Gothic art there. In the 15th century Ferrara, under the Este family, was a center of Humanistic culture and an example of modern urban development; it had an important school of painting. In the 16th and 17th centuries Bologna and the other Emilian cities provided original interpretations of Renaissance and baroque styles, playing a decisive role i n the development of Italian art.

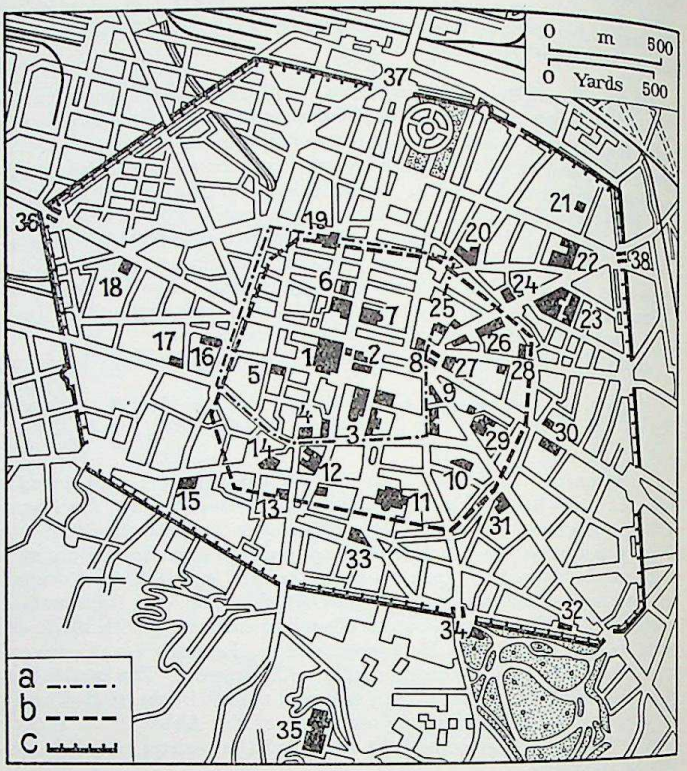
Bobbio. On the left bank of the Trebbia, the town developed around the monastery founded in 612 by St. Columbanus. Episcopal see from 1014 on, Bobbio passed in the 15th century into the hands of the Dal Verme family (vassals of the Viscontis), who in 1440 built the castle in a dominant position (vestiges of the walls and a keep). Of the old monastery, the church, S. Colombano, has remains of plutei, capitals, and inscriptions (collected in the crypt) but was remodeled and reconstructed from the 15th to 17th century. The façade, preceded by a portico, incorporates Romanesque elements; the interior is by B. Lanzano (1526), the choir stalls by Domenico da Piacenza (1488); the campanile is 11th-century. The Cathedral, originally Romanesque, was remodeled in the 15th and 17th centuries. The Museo della Basilica di S. Colombano has an ivory pyxis from the 4th century of the Christian Era.

Bibliog. D. Bertacchi, Monografia di Bobbio, Pinerolo, 1859; C. Cipolla, Notizie e documenti sulla storia artistica della Basilica di S. Colombano nell'età della Rinascenza, L'Arte, VII, 1904, pp. 241–55; A. Rava, La chiesa di S. Colombano in Bobbio, Palladio, V, 1941, pp. 74–77.

Bologna (Etruscan, Felsina; Lat., Bononia). The city stands at the foot of a spur of the Apennines, between the Reno and Sávena rivers. On the heights of the Osservanza and on the plain there are evidences of occupation from the Bronze Age, succeeded by a settlement dating from the Iron Age, with necropolises to the east and west that have yielded abundant and characteristic material from the Villanovan culture (9th–6th cent. B.C.). The subsequent "Certosa" phase (6th–4th cent. B.C.) left the definitive urban outlines of Etruscan Felsina (between the hills and the former beds of the Ravone and Aposa rivers); from this phase come carved commemorative steles, bronzes, Greek vases, etc. Extremely rare traces remain of the occupation by the Gallic Boii, who gave the city its second name. The Roman colony was founded in 191 B.C. The Roman street plan, intersecting at right angles, is still quite recognizable in the medieval and modern street plan at the center of the city; the Via Emilia was the *decumanus maximus*. Still in use is the aqueduct of the Augustan age.

Bologna experienced a new growth in the 11th century as a result of the establishment of the commune and the foundation of the University. It radiated outward from the gates of the original girdle walls along the Via Emilia until it spread as far as the line of the 13th-century walls, now destroyed. It attained special magnificence in the 13th and 14th centuries; after being ruled by various nobles, it passed to the Church. Except for a few 19th-century buildings (Via dell'Indipendenza, Via Rizzoli), the modern city lies beyond the walls, with marked development of new quarters.

A great many monuments of medieval Bologna survive. Of its formerly abundant towers, only a few still stand, among them being the famous and characteristic Garisenda and Asinelli towers (1109). The dwellings are usually of two stories above the ground floor, the second of which has two- or three-lighted mullioned windows projecting over corbels or an arcade. Exceptions are the palace of King Enzo (1246; restored) and the Pepoli houses (14th cent.), without arcades and with crenelated crown. The most notable Romanesque group in the city, called S. Stefano, consists of four churches, a cloister, several courtyards and chapels, and the campanile of the Chiesa del Crocifisso. The complex includes the remains of Early Christian buildings in the octagonal Chiesa del Calvario (or Sto Sepolcro; rebuilt, 12th cent.) and SS. Vitale e Agricola (basilican, with nave, two side aisles, and three apses, rebuilt in the 11th cent.). Dating from the 13th century is the Chiesa della Trinità, with two transverse aisles and a cruciform chapel rebuilt (1927) over the foundations of the 11th–12th century; worthy of note is the 11th-century Romanesque cloister, with 12th-century gallery; the courtyard of Pilate has 12th-century cruciform piers on two sides, and at the center an 8th-century marble pool. These buildings are in the Lombard style that must also have characterized the Cathedral (Metropolitana), dedicated to St. Peter (restored, 16th–17th cent.), of which the ruins of the Lion Door (1220–23) and the tower remain. In the 13th century the Dominicans and Franciscans introduced the Gothic style, drawing their inspiration from Cistercian structures and applying it to Romanesque elements. S. Francesco (13th cent.), which has a nave and two side aisles, buttresses, outer flying buttresses sustaining the ribbed vaults, and an apse with ambulatory and radial chapels, has remained virtually intact (VI, PL. 332); on the high altar is a marble altarpiece by Pier Paolo and Jacobello dalle Masegne (1388–92); also noteworthy is the tomb of Pope Alexander V, by Nicolò Lamberti and Sperandio Mantovano (1424–82). S. Domenico (begun in 1221, incorporating the anterior portion of S. Nicolò delle Vigne), was remodeled in the 18th century; the façade, freed from its later superstructure, remains. The baroque interior retains a *Crucifixion* by Giunta Pisano (12th cent.); the marble tomb of St. Dominic (1267), attributed to Nicola Pisano and workshop (X, PL. 326), with a marble coping by Niccolò da Bari (1469–73; also called Niccolò dell'Arca) and Michelangelo (1495); a reredos by Filippino Lippi; the inlaid wooden choir, 16th century; and the Tartagni tomb by Francesco di Simone Ferrucci (1477). Frescoes in the adjoining chapels include works by Guido Reni and Lodovico Carracci. S. Giacomo Maggiore, begun in 1267,



Bologna, plan. *Key*: (*a*) Hypothetical course of the walls of the Roman city; (*b*) presumed boundary in the 10th century; (*c*) remains and course of the walls, 14th–19th century. Principal monuments: (1) Palazzo Comunale and the Neptune fountain; (2) Palazzo del Podestà and palace of King Enzo; (3) S. Petronio, Museo Civico, and Archiginnasio; (4) Oratory of the Spirito Santo and S. Giovanni Battista dei Celestini; (5) S. Salvatore; (6) Fava palaces and Church of the Madonna di Galliera; (7) the Metropolitana (S. Pietro); (8) Casa dei Drappieri and the Garisenda and Asinelli towers; (9) Loggia della Mercanzia and Palazzo Pepoli; (10) S. Giovanni in Monte; (11) S. Domenico; (12) S. Procolo and Palazzo Bevilacqua; (13) Corpus Domini; (14) Collegio di Spagna; (15) Palazzo Albergati; (16) S. Francesco; (17) S. Isaia; (18) S. Maria della Carità; (19) Palazzo Montanari; (20) Palazzo Bentivoglio; (21) Palazzina della Viola; (22) Pinacoteca Nazionale; (23) University; (24) Teatro Comunale; (25) Malvasia and Salem palaces; (26) S. Giacomo Maggiore and Palazzo Malvezzi De' Medici; (27) S. Bartolomeo; (28) SS. Vitale e Agricola and Palazzo Fantuzzi; (29) S. Stefano and Casa Isolani; (30) S. Maria dei Servi and Palazzo Davia Bargellini; (31) Palazzo Sanguinetti (formerly Vizani); (32) Madonna del Baraccano; (33) Palazzo di Giustizia (court of justice); (34) Porta Castiglione and S. Maria della Misericordia; (35) former monastery of S. Michele in Bosco; (36) Porta S. Felice; (37) Porta Galliera; (38) Porta S. Donato.

has been many times remodeled but retains many Romanesque and Gothic elements. The single-aisled interior with lateral chapels preserves works by Lorenzo Costa (IV, PL. 468) and Francesco Francia (PL. 201). S. Maria dei Servi, begun in 1346, was continued during the 14th century and subsequently remodeled and completed in the 15th and 16th centuries. It is preceded by an atrium of the late 15th century and has a basilican interior with a nave and two side aisles, alternating octagonal piers and columns that sustain pointed arches, and an apsidal peribolos with three radial chapels. A marble altar by Giovanni Angelo da Montorsoli, the Gothic inlaid wooden choir, the *Madonna* by Cimabue, and works by Pellegrino Tibaldi, Guido Reni, and Francesco Albani (PL. 219) are to be seen in the interior. S. Martino (founded, 1217; remodeled several times) has a 19th-century façade, a nave and two side aisles, and pointed arches and vaults. S. Petronio (begun, 1390 by Antonio di Vincenzo; continued throughout the 16th cent. and left unfinished) has a 15th-century façade (also incomplete) with three portals, the center one with bas-reliefs and sculpture by Jacopo Della Quercia (IV, PLS. 152, 153). The Gothic interior (VI, PL. 332) has a spacious chancel and apse. It contains out-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

standing works by Jacopo Sansovino, Parmigianino (XI, PL. 46), Lorenzo Costa, and Giovanni da Modena (VI, PL. 383).

Civil construction, both public and private, developed tremendously; worthy of note is the type of house in brick with terra-cotta decoration, stone arcades, and wooden beams, including the Reggiani Grassi, Pepoli, and Rubini houses, and the Uguzzoni, Azzoguidi, and Galluzzi towers. There are numerous tower-houses, and the Palazzo del Podestà (13th cent.; rebuilt 15th cent. after designs by Aristotile Fieravanti), surmounted by the crenelated Torre dell'Arengo (13th cent.). The Palazzo Comunale (13th cent.) incorporates several buildings, including the house of Accursio, one Gothic-influenced flank by Fieravanti (1425–28), a portal by Galeazzo Alessi and Pellegrino Tibaldi (ca. 1555), and courtyards of the 15th–17th centuries. (The entire group has been restored.) Other buildings of interest are the Palazzo dei Notai (14th–15th cent.); the Collegio di Spagna, by Matteo Gattapone (1365); and the Loggia della Mercanzia (begun, 1383), attributed to Antonio di Vincenzo (extensively restored).

In the Renaissance period a great many buildings were erected by the Bentivoglios (1463–1506). *Churches*: Corpus Domini (1478–80) had a façade decorated in terra cotta and 17th-century interior by Marco Antonio Franceschini (heavily damaged in 1943). S. Giovanni in Monte, rebuilt and enlarged in 1440, overlies a Romanesque structure; the façade is by Domenico Berardi (1474) with lunette decorated by Niccolò da Bari (ca. 1480); in the interior are a circular window with stained glass after designs by Francesco del Cossa, works of Lorenzo Costa, and inlaid wooden choir by Paolo Sacca (1527), and a fine 14th-century *Crucifixion*. The Church of the Madonna del Baraccano (15th cent.; remodeled later; 18th-cent. dome) has a notable *Madonna* in fresco by Francesco del Cossa (1472). S. Michele in Bosco (1494–1510), church of a former monastery, perhaps after designs by Biagio Rossetti, has a door by Giacomo Andrea da Ferrara and Bernardino da Milano (1522); the interior, with nave and spacious choir, is noteworthy for the tomb of Armaciotto de' Ramazzotti (1526) by Alfonso Lombardi; in the refectory and library are frescoes by Cristoforo Gherardi, Stefano Veltroni, Domenico Maria Canuti, and Enrico Haffner; the Carracci cloister is so called from the poorly preserved cycles of frescoes by Lodovico and pupils. The Church of the Madonna di Galliera (rebuilt, 1479) has a fine façade of 1486 and a baroque interior by Giuseppe Antonio Torri. *Secular architecture*: Attributed to Andrea da Formigine are the former Fantuzzi palace (1532) and the Palazzo Calzoni (1529). Other palaces include three formerly belonging to the Favas, one of which is 14th-century, one 15th-century, and one 16th-century, the last with frescoes by the Carraccis and Albani and friezes by Niccolò dell'Abate; the Pallavicini-Fibbia (1497); the Tanari (16th cent.); the Palazzina della Viola, with frescoes by Amico Aspertini and Prospero Fontana; the Bevilacqua (begun, 1474), rusticated, with galleried courtyard; the Bentivoglio (1550–60); the Casa Isolani (formerly Bolognini, 1451–55); the Malvezzi-De' Medici (1560) and the Sanguinetti (formerly Vizani; 1549–62) both by Bartolomeo Triachini; and the Salem (formerly Magnani; 1577–87) by Domenico Tibaldi, with frescoes by the Carraccis (III, PL. 80). The Casa dei Drappieri (1486–96) was remodeled in the baroque period. Of the 16th century is the Neptune fountain, after designs by Tomaso Laureti, with a bronze statue by Giambologna (1566). The Palazzo dei Banchi dates from 1412 but was remodeled by Vignola (1565–68). The Palazzo di Giustizia (formerly Ruini) is partly attributed to Palladio. The University building incorporates three older palaces, the central one of which was formerly the Palazzo Poggi, by P. Tibaldi (1549), which contains frescoes by Niccolò dell'Abate (PL. 217) and Tibaldi (IX, PL. 298).

In the baroque period, in addition to new building, much remodeling of existing buildings was done (e.g., S. Giacomo Maggiore and the Metropolitana). S. Bartolomeo (1653–84) has works by Francesco Albani and Guido Reni. S. Salvatore was rebuilt (1623) by Giovanni Ambrogio Magenta and Tomaso Martelli; it contains works of Vitale da Bologna, Girolamo da Treviso, Giacomo Cavedoni, Garofolo, and others. S. Maria della Vita, on an elliptical plan by G. B. Bergonzoni (1687–90), has an 18th-century dome; the interior has a terra-cotta *Pietà* by Niccolò da Bari; adjoining the church is an oratory by Floriano Ambrosini (1617). S. Maria della Carità, by Pietro Fiorini (1583), has been restored since World War II. The Oratory of S. Maria dei Guarini, by Giuseppe Tubertini, dates from 1788. Outside the city is the Sanctuary of the Madonna di S. Luca (1723–57), by Carlo Francesco Dotti; the plan is elliptical and the forms almost neoclassical; within are works of Donato Creti, Guido Reni, and Guercino, and a 12th-century *Madonna*. S. Paolo (1611), by Magenta, with façade by Ercole Fichi (1636), has works by Lodovico Carracci, Guercino, and Alessandro Algardi.

Among the baroque secular structures are the Archiginnasio (1562–63; by Francesco Terribilia), which houses the public library; the Palazzo Bolognini-Amorini (1525–1902); the Palazzo Davia Bargellini (1638–58; by Bartolomeo Provaglia); the Palazzo Montanari (1752; by Alfonso Torreggiani); and the Teatro Comunale, by Antonio Bibiena (1756), several times remodeled. The Palazzo Hercolani and the Villa Aldini are neoclassic. *Museums*: Pinacoteca Nazionale; Museo Civico, with archaeological material from the Villanovan and Etruscan periods, Roman lapidary work, and medieval and modern sections; Collezioni Comunali d'Arte (in the Palazzo Comunale); Museo d'Arte Industriale and Galleria Davia Bargellini (in the palace of the same name), with crafts, miniatures, and paintings; Galleria d'Arte Moderna (in the Villa delle Rose); Museo di S. Petronio; Museo di S. Stefano; and the museum of S. Domenico.

Carpi. Recorded as early as the Lombard period, Carpi was a seigniory of the Pio family from 1327 to 1525, of the Este family up to 1859. Of the Lombard period is the parish church of the Sagra (consecration), rebuilt in the 12th century. In 1515 the church was shortened and the Romanesque portal was restored to the façade. A 12th-century marble pulpit and 13th-century frescoes are in the interior. The campanile is 13th-century. On the site of an older fortress (11th cent.) stands the Pio castle (14th–16th cent.), which has a long façade with niches, clock tower, keep (1456), and small circular tower (aviary) of 1480. Within are a Renaissance courtyard (restored) and a tower of 1320; the various rooms are handsomely decorated, the Sala dei Mori having frescoes by Giovanni Del Sega. The Cathedral, begun in 1514 by Baldassare Peruzzi, has a baroque façade (1667) with a portal of 1771. The Museo Civico "Giulio Ferrari," is in the castle.

che nella Sagra di Carpi, L'Arte, VII, 1904, pp. 286–97; P. Foresti, La Cappella Pio nel Castello Comunale di Carpi, BArte, VI, 1912, pp. 303–22.

Castell'Arquato. Known since the 6th century, it was subject to the bishops of Piacenza from the 8th to 13th century and subsequently ruled by various nobles. The aspect of the town is predominantly medieval. The Rocca (fortress; 1343) has battlemented towers and a very lofty keep. The Palazzo Pretorio (1293) has a pentagonal tower of the early 14th century and colonnade and outside stairway of the 15th. The Palazzo del Duca (13th–14th cent.; rebuilt in the 15th) faces a fountain of 1292 (restored). The Collegiata (collegiate church) of the 12th century overlies an earlier structure; its façade is decorated with pilaster strips and unsupported small arches, and the basilican interior preserves an 8th-century baptismal font and 14th-, 15th-, and 18th-century frescoes. The Museo della Collegiata houses metalwork, Byzantine textiles, remains of 12th-century sculpture, and paintings.

Bibliog. C. Capezzuoli, Accanto alla Rocca di Castell'Arquato, Cron. d'arte, V, 1928, pp. 3–16; L. Dodi, Il torrione di Castellarquato, Palladio, VI, 1942, pp. 188–91; A. Ambrogio, Castell'Arquato, Piacenza, 1955.

Cesena (Lat., Caesena). On the right bank of the Savio, this was a prehistoric and Roman center. Fine polychrome mosaic pavements from the 3d century have been found here, as have also two large silver plates, one of which has incised figural decoration (III, pl. 387), preserved in the Biblioteca Malatestiana. Devastated by the barbarians, Cesena attained importance in the Byzantine period. Burned in the 10th century, it revived and flourished under the rule of the Malatestas (14th–15th cent.). The oldest part of the city, girdled by walls, is overlooked by the Rocca Malatestiana (fortress), of the late 14th century, enlarged by Matteo Nuti (1466) and Cristiano and Francesco Baldini da Ferrara, with bastions, towers, and curtain wall showing Venetian Gothic influence. The Cathedral (late 14th cent., completed in the 15th and subsequently enlarged) preserves late Gothic elements in the flanks and apse; the façade is of Venetian Renaissance type; the interior has a nave and two side aisles with ogive arches, a chapel with vault frescoed by Corrado Giaquinto (1750), and works of Lorenzo Bregno and Giovanni da Traù. The Biblioteca Malatestiana by Nuti (1452) houses an extensive collection of codices and incunabula. In the center of the Piazza del Popolo is a fountain by F. Masini (1583). S. Agostino (18th cent.) preserves an *Annunciation* by Girolamo Genga. In neoclassic style is the Osservanza (1791), by Leandro Marconi. The Raccolte Comunali are annexed to the Biblioteca Malatestiana.

Solari, Sulla topografia di Caesena, RendLinc, 8th ser., X, 1950, pp. 366–70; G. A. Mansuelli, EAA, s.v. Cesena, II, 1959, pp. 125–28.

Correggio. Roman village, Lombard fief, and earldom as early as 1452, it retains the appearance it acquired under the rule of the da Correggio family (late 12th cent.–1630): nearly square in plan, with broad streets on which face buildings with arcaded façades. The Palazzo dei Principi, begun about 1500, is a brick structure, with simple façade, windows with semicircular arches, marble portals, and colonnaded Renaissance courtyard. S. Quirino, begun in 1513, is attributed to Vignola. S. Francesco (15th cent.; later remodeled) is in Gothic style; the interior has a nave and two side aisles, with alternating piers and columns, and contains a *St. Bernardino* attributed to Mattia Preti. The Museo Civico in the Palazzo dei Principi has works by Mantegna and Aspertini.

Bibliog. E. Bertolini, Le opere artistiche del Principato di Correggio, Reggio Emilia, 1930; R. Finzi, L'urbanistica della città di Correggio, Correggio, 1959.

Faenza (Lat., Faventia). Known especially since the 12th century for its ceramics (faïence), it was probably first an Etruscan town, then Roman; it was a free commune in the 12th and 13th centuries; in 1313, it became a fief of the Manfredi family and finally, in 1510, a church domain. It is laid out on a grid plan and is predominantly Renaissance in character. Little remains of the medieval monuments largely rebuilt or remodeled, such as the Romanesque Church of the Commenda (S. Maria Maddalena), with frescoes by Girolamo Pennacchi (1533); S. Bartolomeo (1209); and S. Agostino, which incorporates 14th-century remnants. The principal monuments face on the adjoining squares, Piazza del Popolo and Piazza della Libertà. The Cathedral (façade incomplete) was designed by Giuliano da Maiano (1474); the interior, with a nave and two side aisles divided by rhythmically spaced alternating piers and columns, was completed by Lapo di Pagno Portigiani the Younger and subsequently remodeled. Notable works within include the shrine of St. Savinus (1476) by Benedetto da Maiano; the shrine of St. Terentianus (15th cent.); and frescoes by Ferraù Fenzoni. The Palazzo del Podestà retains medieval fragments from the 12th and 13th centuries. The Palazzo del Municipio (13th cent., remodeled) contains 18th-century frescoes; adjoining it is the "big arch" of the Molinella, decorated with grotesques by Marco Marchetti (1566). Near the Cathedral is a monumental fountain (1619–21), after designs by D. Castelli, and in the Piazza del Popolo a clock tower, rebuilt after World War II. In the 19th century the loggias characterizing a number of piazzas were restored or reconstructed. Also noteworthy are S. Maria Vecchia (1665), rebuilt over the original 8th-century church, with 10th-century campanile; SS. Ippolito e Lorenzo (1773); S. Domenico, by Francesco Tadolini (1759), with wooden choir stalls by Fra Domenico Paganelli (17th cent.); S. Francesco (rebuilt, 1752), by Giovanni Battista Campidori; the Palazzo Ferniani (16th–18th cent.); Palazzo Laderchi, with 18th-century pictorial decoration. *Museums*: Pinacoteca e Museo Civico, with paintings by the Emilian school from the 14th to the 17th century, and sculpture (Donatello, Benedetto da Maiano, Todin); Museo Internazionale delle Ceramiche.

Archi, Guida di Faenza, Faenza, 1958; EAA, s.v. Faenza.

Ferrara. Built on the lower Po plain on the bank of the former Po di Volano, its origin is uncertain. Of the imperial Roman age a pagus on the left bank of the Volano is recorded. Fortified by the exarch of Ravenna in the 6th century and subsequently a Lombard and Frankish possession, it became an independent commune in the 11th century. Ferrara experienced a long period of cultural and economic primacy, when, in the 15th and 16th centuries, under the rule of the Este family, it became an important Humanistic center and was encircled with bastioned walls culminating in the Castle. At the flank of the medieval city there developed at that time a spacious quarter laid out according to a regular master plan evolved by Biagio Rossetti. In 1598, with its annexation to the Papal State, its decline set in.

Very few medieval monuments remain. A few traces of pre-Romanesque construction may be seen in the former Church of S. Romano, with small 12th-century Romanesque cloister. The Cathedral, begun about 1135 by Lombard artisans, retains intact the original structure of the flanks, with gallery of arches, which also runs along the façade, on which was superimposed, late in the 13th century, the present Gothic façade, with three rows of galleries (pl. 171); the earlier Lombard porch and portals (sculptures by Nicolaus) from the 12th century remain (X, pl. 327). In the Gothic loggia surmounting the porch is a Madonna ascribed to Cristoforo da Firenze (1427); in the tympanum, the Last Judgment (13th–14th cent.), with strong French influences. Added to the right flank in the 15th century were a second gallery and the Loggia dei Merciai (Drapers' Arcade). The interior, reduced from five to three aisles (15th–18th cent.), retains a fresco by Bastianino (1583) in the conch of the apse and canvases by Garofalo and Francia. The Palazzo Comunale (1243; rebuilt in 1924) has a courtyard with a grand staircase by Pietro Benvenuti (1481). The castle of the Este family, square, with corner towers and ringed by a moat, was built by Bartolino da Novara (1385); it incorporates a 13th-century tower. The structure was enlarged by Girolamo da Carpi (1544); in the interior is the outstanding Salone dei Giuochi (Gaming Room), with works of the 15th-century Ferrarese school and the Lombardesque Chapel of Renée of France.

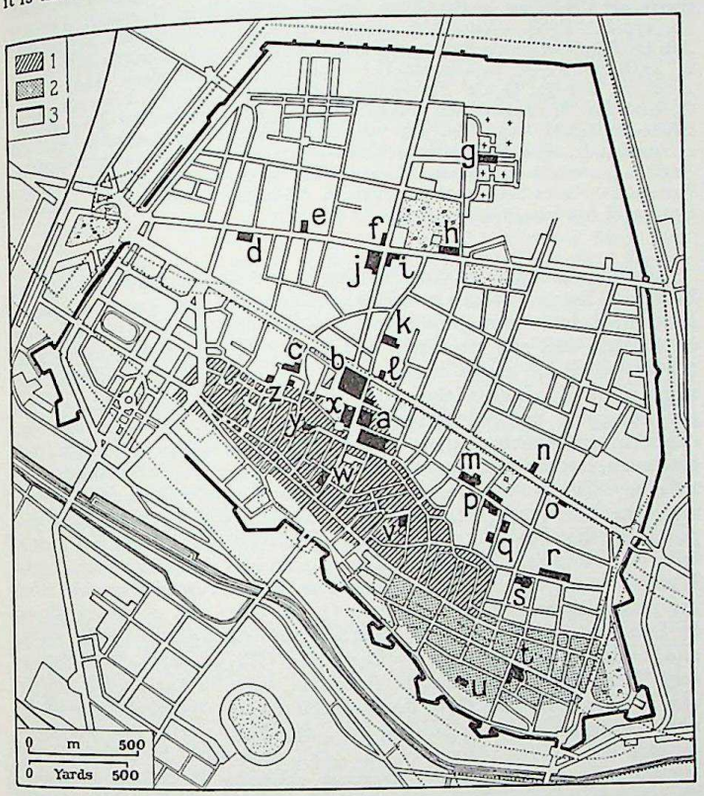
In the Renaissance a growing preciousness appeared in private construction, with the modernization of houses and the construction of new ones with cornices, arched windows, and corner piers. Especially noteworthy are the Este palaces, particularly that of Schifanoia (begun, 1385; enlarged many times), with a marble doorway ascribed to Francesco del Cossa; in the interior, the Sala dei Mesi, with frescoes by Cossa and others (II, pl. 25; IV, pls. 1–3, 5). The Palazzo Pareschi (formerly Estense) has a 15th-century arcaded courtyard with monumental stairway of the 18th century. The Palazzo dei Diamanti was begun by Sigismondo d'Este about 1492 (completed about 1565), with exterior decoration of marble pyramidal bosses, corner frieze with candelabra, and corner loggetta. The Palazzina di Marfisa (1559; restored) has an imposing marble doorway and a 16th-century loggia called "Teatro di Morfisa." Also worthy of mention is the incomplete palace of Ludovico il Moro (1503), attributed to Biagio Rossetti, with an arcaded courtyard on two sides and a frescoed hall attributed to Garofalo; as well as the following palaces and houses:

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

the former Rondinelli and Bevilacqua palaces, the Prosperi-Sacrati and Roverella (1508; rich terra-cotta decoration) palaces, the Casa Cini and Casa Romei (15th cent.), and the Strozzi and Bentivoglio palaces.

A revival of religious architecture also took place in this period. S. Benedetto (1496–1554) has been rebuilt since World War II. S. Cristoforo (begun, 1498), attributed to Rossetti, has a single aisle with lateral chapels and works of Bastianino, Laureti, etc. Adjoining it is the Certosa (1461), today a cemetery. S. Francesco (1494–1530),



Ferrara, plan. *Key*: (1) Medieval area; (2) area developed by Duke Borso d'Este (1451); (3) area within the walls, 1592, including area developed by Duke Ercole I. Principal monuments: (*a*) Cathedral, Arcivescovado, and Palazzo del Seminario; (*b*) Castle; (*c*) S. Domenico; (*d*) S. Benedetto; (*e*) S. Maurelio; (*f*) Palazzo Prosperi-Sacrati; (*g*) S. Cristoforo (or Church of the Certosa); (*h*) Palazzo Massari; (*i*) Palazzo di Bagno; (*j*) Palazzo dei Diamanti; (*k*) Church of the Gesù; (*l*) S. Carlo; (*m*) S. Francesco; (*n*) Capuchin church; (*o*) Palazzina di Marfisa; (*p*) Palazzo Pareschi and Casa Romei; (*q*) S. Girolamo and Corpus Domini; (*r*) Palazzo Schifanoia; (*s*) S. Maria in Vado; (*t*) Palazzo di Ludovico il Moro; (*u*) Monastery of S. Antonio in Polesine; (*v*) Palazzo dell'Università; (*w*) S. Paolo; (*x*) Palazzo Comunale; (*y*) S. Stefano; (*z*) Bentivoglio and Strozzi palaces.

built by Rossetti over an earlier building, has a nave and two side aisles with terra-cotta decoration and frescoes by Garofalo. S. Maria in Vado (1495–1518), with nave and two side aisles, rebuilt after designs by Rossetti and later restored, has frescoes by Lodovico Mazzolino and Carlo Bononi. S. Paolo (1575), designed by Alberto Schiatti, has a severe façade; the interior, with nave and two side aisles, contains frescoes and canvases by Scarsellino and others. The Church of the Gesù (1570), by Schiatti and Giovanni Tristani, contains works by Giuseppe Maria Crespi and the *Deposition*, a terra-cotta group by Guido Mazzoni.

Among the most eminent 17th- and 18th-century structures are the unfinished S. Maria dei Teatini (17th cent.) by Luca Danesi, with frescoes by Clemente Maiola and an altarpiece by Guercino; S. Domenico (1726) by Vincenzo Santini, with a campanile of the early 13th century, terra-cotta façade, and single aisled interior containing works of Scarsellino and 17th- and 18th-century sculpture and paintings; S. Carlo, on an elliptical plan (1623) by Giovanni Battista Aleotti; and the Palazzo del Monte di Pietà (1761). *Museums*: Museo Archeologico Nazionale (in Palazzo di Ludovico il Moro), with excavated material from Spina, important for 5th-century Attic pottery; Pinacoteca Nazionale and Museo Lapidario (in Palazzo dei Diamanti); Museo dell'Opera del Duomo, with 13th-century reliefs from the Cathedral and organ doors painted by Cosmè Tura; Museo di Schifanoia, with miniatures, medals, etc.; Casa Romei, detached frescoes.

Fidenza (Lat., Fidentia). Of Roman origin, it won administrative autonomy in the 1st cent. B.C., declined in the 3d century of the Christian Era, then revived in the 9th under the name of Borgo San Donnino. In the Middle Ages it was a commune, then passed under the control of various nobles. In 1927 it again took its ancient name.

It is built around a central square on which stands the Palazzo Comunale, a Lombard structure of the late 13th century. The most outstanding monument is the Romanesque Cathedral (1207), carried forward in Gothic style (vaults, apse) in the late 12th century; the façade (I, PL. 297), unfinished, is flanked by two towers and has three Lombard porches with columns supported by animal figures and rich splayed portals decorated with reliefs by different hands, all in the tradition of Benedetto Antelami (q.v.); attributed to Antelami himself are the statues of the prophets flanking the main doorway (I, PL. 295); the basilican interior has a nave and two side aisles, with galleries and a 12th-century crypt with the urn of St. Donnino, perhaps by Pietro da Rho.

BIBLIOG. A. Pettorello, S. Antonio, Rass. d'arte, VI, 1906, pp. 22–30; G. de' Francovich, Benedetto Antelami, Florence, 1952; N. Denti, Guida di Fidenza, Fidenza, 1959; EAA, s.v. Fidenza.

Forlì (Lat., Forum Livi). Settlements from the Bronze and Iron ages have been unearthed in the environs. Occupied in the 2d century B.C. by a Gallic people, it was later a Roman town, the remains of which include baths and pottery workshops and epigraphic, architectural, and mosaic relics. In the Middle Ages it flourished as a free commune and in the Renaissance under the rule of the Ordelaffi family. It centers around a square, on which the principal monuments face. S. Mercuriale, with its campanile, dates to the 12th century but has been remodeled at various times. The portal is decorated with reliefs by disciples of Antelami. The interior, basilican in plan, was lengthened in the 16th century; the nave and side aisles are divided by columns and piers. The mosaic pavement is 14th-century, the crypt from 1176. Works in the interior include the tomb of Barbara Manfredi (ca. 1470) by Francesco di Simone Ferrucci; panels and frescoes by Marco Palmezzano, Bernardino Poccetti, Passignano, Carlo Cignani, and others; and inlaid wooden choir stalls (1535). The Palazzo del Municipio (rebuilt, 1359), with Renaissance arcade and various alterations of 1459 preserves frescoes by Bibiena and Francesco Menzocchi. The Palazzo del Podestà (1459–60) is extensively restored and rebuilt. S. Filippo is of the 17th century; and S. Maria dei Servi, the octagonal S. Antonio Abate, the Church of the Carmine, and the Church of the Trinity are all of the 18th century. In 1841 Giulio Zambianchi almost entirely rebuilt the 12th-century Cathedral (Sta Croce), already altered in the 15th century; in the neoclassic interior, with nave and two aisles, is a baptismal font by Tomaso Fiamberti and *The Assumption* by Carlo Cignani. The Rocca di Ravaldino (fortress of the late 14th cent.) has been several times enlarged, destroyed, and rebuilt. The Pinacoteca Comunale, the Museo Etnografico Romagnolo, and the Museo Archeologico are all housed in the same building.

Imola (Lat., Forum Cornelii). The Roman city, which was named for Lucius Cornelius Sulla (82 B.C.), developed on a presumably Etruscan site; the modern city dates from the Middle Ages (mentioned by Paulus Diaconus). It was at first a dependency of the exarch and later of the bishop of Ravenna. Subsequently it was ruled by a number of lords; in 1504 it passed to the Church. The town plan of the 1st century, aligned in accordance with the *cardo* and *decumanus* (Via Flaminia), accounts even today for the city's urban appearance, with its rectangular plan based on a regular rectilinear street system. From the 1st and 2d centuries there remain an amphitheater and some mosaics. The medieval buildings were extensively remodeled by Cosimo Morelli in the 18th century. The Cathedral (S. Cassiano), basilican, with dome (12th–13th cent.) and campanile (1473–85), was completely rebuilt in 1781; the façade is 19th-century. S. Maria in Regola, rebuilt, retains the cylindrical campanile from 1181. S. Domenico (14th cent.) has incorporated in the 18th-century reconstruction the Gothic portal and polygonal apse; within, *Martyrdom of St. Ursula*, by Lodovico Carracci. The Palazzo Comunale, known since the 12th century, has some Romanesque and Gothic remnants but was remodeled in 1758. The Rocca (14th cent.), with fortifications dating from 1473, later enlarged and then partially dismantled, has a square plan with cylindrical corner towers. *Museums*: Museo Archeologico; Raccolta d'Arte Comunale.

Modena (Lat., Mutina). Inhabited since protohistoric and Etruscan times, it became first a Roman colony (183 B.C.), then a municipium with regular plan on the Via Aemilia. Its decline began in the 4th century; it revived in the 9th, developing around the small basilica of S. Giminiano (on the site of the present Cathedral), and was girdled with walls. It became a free commune in the 12th century; from 1336 on it was a domain of the Este family. Divided in two by the Via Emilia, it is circled by broad, tree-shaded streets (replacing the pentagonal walls), beyond which extends the modern city.

The Cathedral, begun by Lanfranco in 1099, overlying earlier buildings of the 4th century, was completed in the 13th century. The tripartite façade has sculpture by Wiligelmo da Modena (q.v.) and the Campionesi (q.v.), an arcaded covered gallery that is carried around the flanks, and center portal with porch and gallery. On the right flank are the Porta dei Principi (restored), with sculptures by the school of Wiligelmo, and the Porta Regia (13th cent.) of the Campionesi; on the left, the Porta della Pescheria (X, PL. 253) by a disciple of Wiligelmo. The campanile ("Ghirlandina") is contemporaneous, with spire from 1261–1319 (I, PL. 395). The interior has a nave and two side aisles (with 15th-cent. vaults) and three apses, without a transept. The *pontile* is decorated with carving by Anselmo da Campione and assistants (III, PLS. 17, 18); the choir stalls are by Cristoforo and Lorenzo da Lendinara (1465). The only monastic church retaining its ancient structure is S. Francesco (Gothic, 1244; restored 1828–29 with simple brick façade, nave and two side aisles, and three polygonal apses; within is a *Deposition* (terra cotta) by Antonio Begarelli.

In the Renaissance, the Church of S. Pietro was rebuilt with typical terra-cotta decoration on the façade, campanile with spandrels, and interior with nave and four side aisles (works of F. Bianchi Ferrari, Romanino, Antonio Begarelli, Dosso Dossi, and Giacomo Cavedoni). S. Biagio was rebuilt in 1661 after designs of Cristoforo Malagola (Galaverna), with single apsidal nave and dome; within are frescoes by Mattia Preti and others. S. Agostino (14th cent.; rebuilt in the 17th) has interior stucco decoration and a *Deposition* by Antonio Begarelli. The Chiesa del Paradiso (S. Filippo Neri; 1596) was designed by Giovanni Guerra, with ellipsoidal nave, transept, and dome on paired columns. S. Giorgio was begun in 1647 after designs by Gaspare Vigarani, with façade and high altar by Antonio Lurago (17th cent.). The Jesuit church, S. Bartolomeo (1607), with façade of 1727, contains frescoes by Andrea Pozzo and assistants. S. Giovanni Battista (restored, 1799), on a Greek-cross plan, preserves a terra-cotta *Lamentation* by Guido Mazzoni (1476; PL. 200).

Secular architecture of note includes the Palazzo Ducale (1634, designed by Bartolomeo Avanzini), with a salon frescoed by M. A. Franceschini and the Salottino d'Oro by Michele Salvadori; the Palazzo Comunale, medieval but almost entirely rebuilt in the 17th and 18th centuries; the Ghisellini and Ferrari-Moreni Renaissance palaces; and the Palazzo dei Musei (former Almshouse) from 1753, remodeled later. *Museums*: Galleria, Museo e Medagliere Estense (in the Palazzo dei Musei), with works by El Greco, Velázquez, Giovanni di Paolo, Bernini, Correggio, Tura, and Niccolò dell'Abate, and medals by Pisanello and Matteo de' Pasti; Biblioteca Estense, with the Bible of Borso d'Este (15th cent.); Museo Lapidario del Duomo (detached metopes); Museo Lapidario; Museo Civico.

Parma. Situated on the Via Emilia and the Parma River, Parma became a Roman colony in 183 B.C. From the 4th century onward it declined, but a perceptible revival of building activity was manifest in the 12th and 13th centuries and later, in the 19th century, during the period of the grand duchy of Marie Louise of Austria, who was responsible for most of the urban transformation of the city and its predominantly modern aspect, with broad streets and squares. The medieval city centered upon the Romanesque Cathedral, begun before 1046, largely destroyed by the 1117 earthquake, and subsequently rebuilt, with Gothic chapels inserted on the left flank (14th cent.) and campanile (1284; PL. 171). The façade has a covered gallery and porch (in the archivolt, *Assumption of Mary*); the interior has a nave with two side aisles, women's galleries, transept, and choir over a crypt. Notable works within are a carved altar of red Veronese marble, from the preceding structure; *Deposition* (I, PL. 292) and episcopal throne by Benedetto Antelami (q.v.); frescoes from the 15th to 18th century, and, in the dome, frescoes by Correggio (III, PL. 471). The Baptistery (1196–1307), attributed to Antelami, save for the Gothic crowning, is octagonal, with three doors and five rows of loggias (one blind) and sculptures by Antelami (I, PLS. 292–295, 297). The polygonal interior has a ribbed dome (I, PL. 414), decoration by Antelami and assistants, and 13th-century frescoes showing Byzantine influence. The only remnants of the Romanesque structure of Sta Croce (1210) are the apse, the oblong windows, the portal, and the plan of the interior. Also built in the communal period but heavily restored are the Palazzo del Capitano del Popolo (ca. 1230), the Palazzo dei Notai (1287), and the Vescovado (mid-13th cent.). Specimens of Gothic are S. Francesco del Prato (1260–1462); the former Church of the Carmine (1313–1494); and Sto Sepolcro (1252), extensively remodeled, particularly in 1460.

The city's development with regard to its monuments was remarkable during the 16th, 17th, and 18th centuries, when it was the capital of the duchy of the Farnese family. S. Giovanni Evangelista (1510), by B. Zaccagni the Elder, with façade by Simone Moschino of Orvieto (1607), has a basilican Renaissance interior with nave and two side aisles separated by piers (PL. 200). The spandrels and dome (III, PL. 470) and the left transept were frescoed by Correggio. In the left aisle are frescoes by Parmigianino. The Madonna della Steccata (begun, 1521) was designed by Bernardino and Giovanni Francesco Zaccagni on a Greek-cross plan, with semicircular apses on either side and corner chapels visible on the outside. The dome has external decoration by Mauro Oddi (late 17th cent.). The interior contains works by Parmigianino. The Camera del Correggio, the chamber of the abbess of the former Convent of S. Paolo (also called Camera di S. Paolo), is one of the masterpieces of Correggio, with a vault divided into 16 segments over lunettes with mythical figures (III, PL. 465). The SS. Annunziata (begun, 1566) has an elliptical plan by Giovanni Battista Fornovo and dome by Girolamo Rainaldi (1632). S. Alessandro, built (1507) by B. Zaccagni the Elder over an earlier structure, was rebuilt by Giovanni Battista Magnani (1622–24); the interior has a nave with lateral chapels and frescoes by Angelo Michele Colonna and Alessandro Tiarini. The Oratory of S. Lucia, rebuilt over a 13th-century church, has a façade by Mauro Oddi (1691) and altarpiece by Sebastiano Ricci (1730). The Oratory of the Capuchins, by Giovanni Francesco Testa (1561–69), was later remodeled; within are frescoes by Giovanni Maria Conti and Pier Antonio Bernabei and the *Dead Christ* by Ricci. S. Maria del Quartiere, by G. B. Magnani and G. B. Aleotti (1604; remodeled in the 18th cent.), is hexagonal in plan; frescoes in the dome are by Bernabei (1626–29). S. Antonio Abate was begun in 1712 after designs by Ferdinando Galli (Bibiena), with nave and frescoed double vault. S. Pietro Apostolo

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

rebuilt (1761) by Ennemondo Petitot, has a single aisle and stucco and fresco decoration by Antonio Ferraboschi and Giovanni Antonio Vezzani. The ancient Church of S. Ulderico, remodeled (1740), has a façade by Gaetano Ghidetti (1762), a single aisle, and frescoes by Antonio Bresciani (1762). *Secular architecture*: The Palazzo della Pilotta (begun, 16th cent.), after designs by Giovanni Boscoli, was continued in the 17th century by Giovanni Domenico Campanini, Pier Francesco Battistelli, and G. B. Magnani. The Farnese Theater (1618), by G. B. Aleotti, is annexed to it. The Palazzo Ducale, in a park, was begun in 1564 by G. B. Boscoli and remodeled by Petitot in 1767; frescoes in the interior are by Cignani and Tiarini. The Palazzo del Municipio (1627), by G. B. Magnani, retains vestiges of the 13th-century palace. The Teatro Regio by Nicola Bettoli (1829) is neoclassic. The INA Building by F. Albini (V, PL. 117) is notable among the modern buildings. *Museums*: Museo Nazionale di Antichità e Galleria Nazionale (works of Correggio, Parmigianino, Venetian painters) in the Palazzo della Pilotta; Pinacoteca Stuard; Museo Etnografico Cinese (Oriental Collection).

Piacenza (Lat., Placentia). At the terminus of the Via Emilia, on the right bank of the Po, this was a Roman colony (218 B.C.) and later a municipium. Important in the early Middle Ages as a trade center, it attained communal autonomy in the 11th century and later was a fief of various nobles. In the center of the modern city, the ancient Roman castrum is discernible in the right-angled pattern of the streets. The medieval city developed eastward, giving rise to the present elliptical plan. It was encircled with fortified walls in the 16th century and had a castle (destroyed). The Austrians converted it into a fortress in the 19th century (walls and bastions now in ruins).

The original cathedral, S. Antonino (4th cent.), fallen into ruins in the 9th century, was rebuilt in the 11th on an eastward-facing Greek-cross plan and was subsequently (13th cent.) redesigned as an inverted Latin cross with different orientation; it is noteworthy for the atrium, called "the Paradiso" (restored), by Pietro Vago (1350). The present Cathedral (1122–1233) is a domed basilica in Lombard Romanesque style with a number of Gothic features; its portal has sculpture by the school of Wiligelmo da Modena and Nicolaus (qq.v.); frescoes in the interior date from the 14th to 17th century (L. Carracci, C. Procaccini, P. F. Morazzone, Guercino); and the carved wooden chancel is by Giangiacomo da Genova (1471). S. Savino, recorded as early as the 10th century, retains 12th-century construction (restored) the 12th-century mosaics in the pavement of the transept and the crypt, and a noteworthy wooden Crucifix from the 12th century. Other medieval churches include S. Brigida (12th cent.; remodeled); S. Ilario (now housing the city archives), founded about 1120; and S. Francesco, which dates from the Gothic period (begun, 1278), with apse, ambulatory, and radial chapels. Lombard influences are apparent in the Church of S. Giovanni in Canale (founded, 1220; remodeled). The Palazzo del Comune (begun, 1281) develops the forms of the courthouses of the northern Italian cities (VI, PL. 339). It was enlarged and remodeled in later centuries. S. Sisto (1511), by Alessio Tramello, with façade reconstructed in 1755, has a nave and two side aisles with granite columns and is preceded by a barrel-vaulted narthex; in the interior are works of Guercino, Procaccini, Palma Giovane, and L. Bassano. Sto Sepolcro (1513–33) was designed by Tramello. The Madonna di Campagna (1522–28), also by Tramello, is built on a Greek-cross plan, with octagonal dome and lantern and corner chapels; the chancel was lengthened in the 18th century. Frescoes in the dome are by Pordenone and Soiaro. S. Vincenzo (1595), with nave and two side aisles, is surmounted by an octagonal dome; fresco decoration is by Andrea Galluzzi and Giovanni Battista Draghi. *Secular architecture*: The Palazzo Landi (15th cent.; now the Courthouse) has an elegant lateral marble door and terra-cotta decoration in the courtyard. The Palazzo Farnese (1558–93) was built after designs by Francesco Paciotti, under the supervision of Vignola, but remained unfinished. Modern buildings of note include the housing unit by the architect L. Vaccaro, and the Rossi Cement Laboratory by L. Magistretti. *Museums*: Museo Civico; Galleria del Collegio Alberoni; Galleria d'Arte Moderna Ricco Oddi (19th-century Italian artists); Museo di S. Antonino.

Pomposa. This small town was named after the abbey, founded in 523, which was a thriving cultural center throughout the Middle Ages and seat of a priory with civil jurisdiction. Because of the unhealthful climate the abbey declined in the 13th century. The monastic complex consists of the church, with campanile, and living quarters arranged along two sides of an open courtyard (formerly the cloister). The church (S. Maria) was built between 751 and 874. It is basilican in form, influenced by Ravenna models, with median apse that is circular inside and polygonal outside. The last two bays and the triple-arched portico, with decoration of terra cotta and majolica, and the transenna were added about the beginning of the 11th century. The interior, which has a nave and two side aisles, is decorated with 14th-century frescoes. The campanile (by Deusdedit; 1036) has courses of red and yellow brick with nine rows of cornices, slender string-courses, and conical spire. The monastic rooms — chapter hall (with Giottesque frescoes from the 14th cent.), refectory (with frescoes attributed to Pietro da Rimini, 14th cent.), and dormitory on the second floor — reveal the 12th-century construction. The Palazzo della Ragione, where the abbott dispensed justice, stands apart. Dating from the 11th century (restored), it has a gallery of Venetian type over a flat portico.

Ravenna. Built as early as the pre-Roman period on pilings in the islands of the lagoon in the Po delta, it was separated from the mainland by broad swampy areas slowly silted up over the ages; the city is now on a plain about 7 miles from the sea. It was inhabited, according to tradition, by Etruscans and Umbrians; it became a Roman municipium, with a rectangular perimeter and grid plan, still discernible today. Augustus built the military port of Classis there. Dating from the Augustan age are the relief bearing the likenesses of the members of the Julio-Claudian family and a considerable number of polyconic steles, several bearing portraits of soldiers from the fleet of Classis. In 402 Honorius moved the imperial headquarters there and made it a bulwark against the barbarians. The city continued to expand, first to the north and then to the east. Enriched with monuments by Galla Placidia and by the barbarian kings Odoacer and Theodoric, it reached its zenith when it became the seat of the Exarchate in 544, in the service of Byzantium. Its decline set in in the 8th century with the obstruction of the port and canals. Reclamation works, particularly the dredging of the canals, are today giving new life to the city.

As early as the beginning of the 5th century the Basilica Ursiana (Church of the Anastasis) was built, backing against the walls; it was completely remodeled in the 18th century (see below, Cathedral); there remain a few fragments of 12th-century sculpture and the mosaics from the apse. Within the limits of the Caesarean city, Galla Placidia had the Church of S. Giovanni Evangelista built; it retains the basilican plan and columns with capitals on impost blocks, but little remains of its ancient decoration (X, PL. 190). In the region of

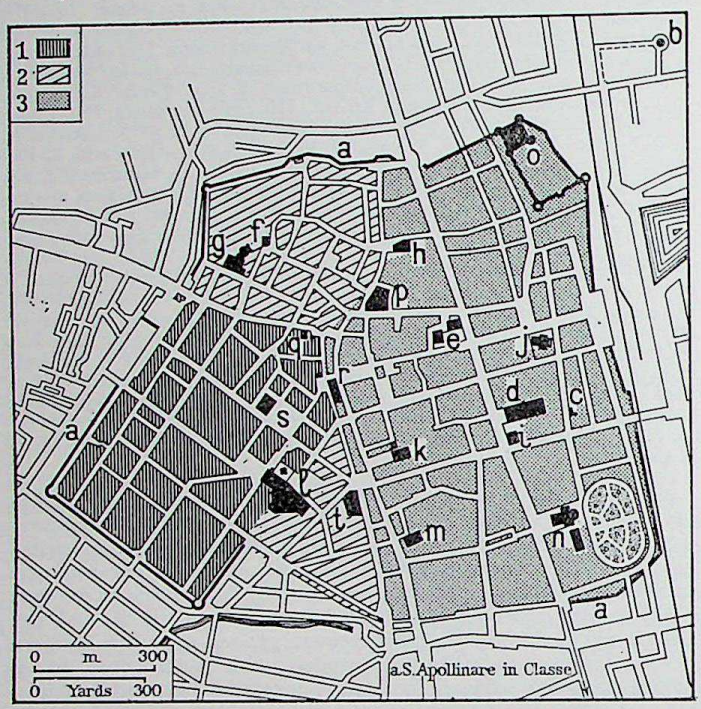
the Domus Augusta is Sta Croce (mutilated and despoiled). There are several commemorative shrines: that of St. Vitalis is within S. Vitale, and that of St. Lawrence in the so-called "Mausoleum of Galla Placidia" (early 5th cent.). The latter building, adjoining Sta Croce, is perfectly preserved. It is in the form of a Latin cross, with walls sheathed in brick adorned with vertical moldings and blind arches (II, PL. 425) and, in the interior (IV, PL. 458), very remarkable mosaics of local workmanship in which elements of the late-antique period mingle with those of incipient Byzantine art (X, PL. 179). Dating from a few years later (mid-5th cent.) is the octagonal Baptistery (of Neon,



Ravenna, plan. *Key*: (1) Area of the Roman municipium; (2) 5th-century expansion; (3) barbarian and Byzantine addition. Principal monuments: (*a*) Walls; (*b*) Mausoleum of Theodoric; (*c*) ruins of the Palace of Theodoric; (*d*) S. Apollinare Nuovo; (*e*) Baptistery of the Arians and Church of the Spirito Santo; (*f*) "Mausoleum of Galla Placidia"; (*g*) S. Vitale and Museo Nazionale; (*h*) S. Giovanni Battista; (*i*) Palazzo dei Calchi (or degli Esarchi); (*j*) S. Giovanni Evangelista; (*k*) S. Francesco and the tomb of Dante; (*l*) Cathedral, Baptistery, and Arcivescovado; (*m*) S. Agata Maggiore; (*n*) S. Maria in Porto and Loggia del Giardino; (*o*) Rocca di Brancaleone; (*p*) Palazzo Spreti; (*q*) S. Domenico; (*r*) Palazzo Comunale; (*s*) Palazzo Rasponi dalle Teste; (*t*) Accademia di Belle Arti.

or the Orthodox), with alternating niches, and dome decorated in stucco and mosaic. In the vicinity is the Arcivescovado (bishop's palace; completely remodeled), with internal chapel (5th–6th cent.), in the form of a Greek cross, preceded by a vestibule and terminating in a semicircular apse (fresco of the *Christus militans*, and mosaics). Under Theodoric (6th cent.) the Arians juxtaposed their own monuments with the Catholic ones. Among these are the former Church of S. Teodoro (now the Church of the Spirito Santo, rebuilt in the 16th cent.), which still has 6th-century columns, capitals, and ambo; and the octagonal Baptistery of the Arians with mosaic in the dome. Within the limits of the Caesarean city, Theodoric built his own palace and S. Apollinare Nuovo (probably the pontifical church), basilican, with nave and two side aisles, adorned with mosaics in three registers. The upper band represents scenes from the life of Christ; the center, prophets and saints; and the lower band was completed by the *Procession of the Virgins and Martyrs* (III, PL. 301) in the mid-6th century. The city of Theodoric ended to the eastward in the field of the Coriandro, where the so-called "Cuirass of Theodoric" was found. There stands the tomb of the Ostrogothic king (IV, PL. 457), decagonal on the outside but in the form of a Greek cross on the interior, with great limestone conchs and monolithic dome. Under the reign of Amalasunta work was begun on the construction of S. Vitale (II, PL. 430), which was consecrated by Maximian (547 or 548). Octagonal in plan, the church is preceded by an apsidal narthex and triangular connecting vestibules, with triforia terminating in two staircase towers. Within (I, PLS. 384, 411), the center room opens into exedrae which lead into an ambulatory on the ground floor and a gallery on the upper level; the center room is surmounted by a dome. The main apse is flanked by two apsidioles, the *prothesis* and *diaconicon* (II, FIG. 775). The mosaics depicting the Court of Theodora and Justinian (II, PLS. 440, 446; IV, PL. 18) are by Byzantine masters, the others by local artists; the capitals with impost blocks are noteworthy. Building activity continued with the erection of S. Apollinare in Classe (consecrated in 549; II, PL. 430), with atrium (now gone), exonarthex flanked by towers (restored), and basilican interior (II, PL. 431) with contemporaneous mosaics (X, PL. 181) and sarcophagi from different periods. After the 6th century only enlargements (crypts) and restorations are noted. In the 9th and 10th centuries, cylindrical campaniles were erected, with varying numbers of rows of windows (e.g., S. Apollinare Nuovo, S. Apollinare in Classe). In the Romanesque and Gothic periods there was a resumption of construction by the religious orders. S. Maria in Porto was built by the Portuensi (1096; rebuilt after the 1944 bombardment), and the now deconsecrated S. Chiara (13th cent.) by the Franciscans.

From the 16th century onward construction was chiefly devoted to the alteration and restoration of earlier buildings such as the Palazzo Comunale (with portico) and the adjacent Palazzetto Veneto (1462). The Rocca di Brancaleone, a Venetian fortress (1457), was partially dismantled in the 17th–18th century. The Loggia del Giardino (1508) is in Lombard style. S. Agata Maggiore (rebuilt about 1600 over a 5th-cent. building) has a Renaissance façade and a basilican interior with nave and two side aisles; within are an ambo (8th cent.) and a wooden choir (1545) by Alessandro Bigni. The cylindrical campanile is of 1560. S. Maria in Porto (begun, 1553) has an 18th-century façade by Camillo Morigia, interior with nave and two side aisles, a Byzantine marble relief of the "Greek Madonna," wooden choir (1593), and canvases by Scarsellino and Palma Giovane. S. Giovanni Battista, by Pietro Grossi, is 17th-century; it overlies a 5th-century building, of which parts of the apse remain, and has a cylindrical campanile. S. Domenico (1269) was remodeled in the 14th century and rebuilt in 1699–1703 after designs by Giovanni Battista Contini. S. Maria Maggiore, rebuilt in 1671 over an earlier 6th-century building, has retained the original columns with capitals and portal. Dating from the 18th century are the Rasponi dalle Teste and Spreti palaces. The Cathedral, rebuilt in 1743 over the Basilica Ursiana by Giovanni Francesco Buonamici, has a dome by G. Pistocchi and a cylindrical campanile of the 9th–10th century; the interior, with nave and two side aisles, preserves a 6th-century ambo and the sarcophagi of St. Rainaldo Concoreggio and St. Barbaziano. The Chapel of the Sacrament, by Carlo Maderno, has frescoes by Guido Reni and assistants (1620). The tomb of Dante, by Pietro Lombardo (1483), lies within a small temple designed by Morigia (1780). *Museums*: Museo Nazionale; Museo Arcivescovile (with the so-called "throne of Maximian," 6th cent.); Pinacoteca dell'Accademia di Belle Arti.

Reggio Emilia (Lat., Forum Lepidi, Regium Lepidi). In a district that was densely populated during the prehistoric period, the Roman town was built in the 2d century B.C. on the Via Aemilia. Monumental cemeteries remain from the republican and Augustan periods; mosaic pavements, from the 2d cent. In the Middle Ages Reggio became a free commune, subsequently passing under the sway of various rulers, the last ones being the Este family. Renaissance and baroque edifices characterize the city in a still-medieval urban setting. The Cathedral (9th cent.; rebuilt in the 13th and at various times thereafter) has retained elements of the Romanesque façade in the partial revetment by Prospero Spani (1544); it is dominated by an octagonal tower with copper Madonna by Bartolomeo Spani (1552). The interior, rebuilt in the 17th century, has a nave and two side aisles with piers and barrel vaults, elevated chancel over the crypt with three semicircular apses, tombs of Valerio Malaguzzi and Bishop Arlotti by B. Spani; tomb of Bishop Rangone; tombs of Girolamo Fossa and Cherubino Sforzani; and ciborium by P. Spani. The Baptistery (S. Giovanni Battista), incorporated into the façade of the bishop's palace, assumed its present form in the late 15th century. The Torre del Comune (del Bordello) is of the same period. The Madonna della Ghiara (begun, 1597, by Alessandro Balbi) has a dome by Francesco Pacchioni (1619); the interior, in the form of a Greek cross, is rich in frescoes. S. Giovanni Evangelista, a single-aisled church, has a *Deposition* in terra cotta by Guido Mazzoni. The Benedictine church, SS. Pietro e Prospero, rebuilt (1586–89) by Giulio della Torre, has a dome by Paolo Messori (1629) and façade by Pietro Armani (1782); there are modern frescoes (1930) by Anselmo Govi in the single-aisled interior. The cloisters of the former monastery are by Prospero and Francesco Pacchioni and B. Spani (16th cent.). S. Prospero (10th cent.; rebuilt in 1514–27) has an 18th-century façade (1748–53) by Giovanni Battista Cattani; within, nave and two side aisles with frescoes; the octagonal campanile, incomplete, is by Cristoforo Ricci (1551). S. Agostino was rebuilt in the 15th century by Antonio Casotti (apse and campanile still extant) and subsequently in 1651–66 by Gaspare Vigarani. S. Gerolamo, also by Vigarani (1646), consists of three superimposed churches, one of which is circular. S. Giorgio (1638) was enlarged in 1743 by Alfonso Torregiani, who added the dome and transept; the interior has frescoes by Bibiena. *Secular architecture*: The Palazzo Comunale (1414) was rebuilt in the 18th century. The Casa Ruini and the little palace called "Boiardi" are elegant private dwellings of the 16th century. Neoclassic buildings of the 19th century include the Palazzo Corbelli by Pietro Marchelli and the Municipal Theater (C. Costa). In the 20th century, the Palazzo del Capitano del Popolo was rebuilt in Gothic style. Notable recent buildings are the INA apartments, the Chamber of Commerce and Mercantile Exchange, and the Chiesa della Vecchia by the architect Manfredini (1959). *Museums*: Musei Civici (with notable paleolithic collection including the "Venus" of Chiozza); Galleria Anna e Luigi Parmeggiani (Flemish paintings, El Greco).

Rimini (Lat., Ariminum). A port on the Adriatic, the town was probably Etruscan, Umbrian, and later Gallic; it became a colony of the Romans in 268 B.C. Remaining from the Roman period are the Arch of Augustus (27 B.C.), serving as a monumental gate to the city at the outlet to the Via Flaminia; the Bridge of Tiberius; the amphitheater, perhaps from the first imperial period; and the walls. The regular urban plan is discernible. A commune in the medieval period, it reached its zenith under the rule of the Malatestas (15th cent.). The Palazzo dell'Arengo (1204, remodeled) has a portico below, with pointed arches, and above a row of multiple-arched windows (PL. 187); in the interior is a large salon with frescoes (14th cent.). The Palazzo del Podestà (ca. 1334) has been extensively remodeled. S. Agostino (1247), with single aisle, was rebuilt in the 18th century and decorated with stucco by Bibiena and frescoes by Vittorio Bigari; it preserves frescoes of the 14th-century Rimini school. The tall campanile is Gothic.

Particular importance attaches to the building activities during the Renaissance. The Castello Sigismondo (Malatesta), completed in 1446, is now a ruin. Refacing and remodeling of the Gothic Church of S. Francesco (renamed Tempio Malatestiano) was begun by Leon Battista Alberti (q.v.); Matteo de' Pasti supervised the execution of the Albertian project and the refinishing of the interior. The façade (I, PL. 52) is divided into three sections by fluted semicolumns, between which are three semicircular blind arches. The upper part, with broken triangular tympanum, is incomplete. The flanks, broken at regular intervals by imposing semicircular arches separated by piers, house the tombs of a number of Humanists. The interior, which has a nave flanked by chapels, retains the Gothic plan, the structure of which is enriched by Renaissance sculptural decoration created by Agostino di Duccio (q.v.) and his assistants (III, PL. 302). Noteworthy in the interior are the tombs of Sigismondo Malatesta and Isotta degli Atti (IV, PL. 400); the Arca degli Antenati e dei Discendenti (1454; A. di Duccio); the Chapel of the Reliquaries, with fresco by Piero della Francesca (1451); the Chapel of the Liberal Arts, with allegories by Agostino di Duccio; and a Crucifix attributed to Giotto (VII, PL. 377).

In 1551–78, on the site of the Benedictine Abbey (9th cent.), S. Giuliano was rebuilt with a single aisle; within are the *Martyrdom of St. Giuliano* by Veronese and a polyptych by Bittino da Faenza (1409). In the baroque period the Palazzo Comunale was built (1687) by Francesco Garampi. S. Maria dei Servi (ca. 1357) was rebuilt in 1779 by Gaetano Stegani; it has a single aisle and stucco decoration by Antonio Trentanove. Giovanni Francesco Buonamici designed the clock tower (1759; now rebuilt). *Museums*: Museo Civico; Pinacoteca Comunale; Museo Missionario Francescano.

Francesco in Rimini, Kchr., XIII, 1960, pp. 348–51.

Spina. An ancient city, ascribed by tradition to the Pelasgi, built probably toward the end of the 6th century at the mouth of a now silted-up branch of the Po, Spina became the greatest Etruscan port of call of the Po area and of northern Italy on the Adriatic, with intensive traffic with Greece. It began to decline because of its increasing separation from the sea and the Gallic invasion (4th cent.). In the Roman period it had shrunk to a small village. Two vast cemeteries have been discovered and excavated in the Trebba and Pega "valleys," now reclaimed, to the west. Finds include Attic vases (XI, PL. 188), largely from the 5th century B.C., Etruscan bronzes, and metalwork (Ferrara, Mus. Arch.). By means of aerial photography and a number of soundings, the town has been definitely located, standing on pilings in the midst of canals.

Hirmer, Spina, Florence, 1958; Spina e l'Etruria padana, SEtr, XXVII, 1959, Sup; Mostra dell'Etruria padana e della città di Spina (exhibition cat.), 2d ed., 2 vols., Bologna, 1961.

Velleia (Lat., Veleia). In the midst of the Apennines, south of Piacenza, it was built over a pre-Roman town of the Liguri Veleiates; it became a Roman colonia in 89 B.C., then a municipium in 49. Landslides caused the town to be abandoned after the downfall of the empire. It was built on terraces, necessitated by the nature of the terrain. Discoveries include the forum and basilica, adorned with statues of members of the Julio-Claudian family (now in Parma, Mus. Naz. di Antichità), a small amphitheater, houses, three public buildings, and the baths. Velleia is the source of the bronze Tabula Alimentaria of Trajan, a basic document on the agricultural economy of the district. The Antiquarium containing bronzes, coins, architectural fragments, and casts of the sculptures which are now in Parma.

(*b*) *Republic of San Marino.* This is the oldest surviving town-republic in Europe, having developed about a religious community founded by St. Marinus (4th cent.) on Mount Titanus, on the border between the Marches and Romagna. The city of San Marino is predominantly medieval in appearance, with remarkable ruins of three concentric rings of walls from the 13th–16th centuries, surmounted by three towers (La Rocca, La Cesta, and Il Montale). The Rocca (Geraita) is surrounded by two rows of walls; the original medieval construction (probably 11th cent.) underwent remodeling in the 15th–17th centuries. La Cesta is a 15th-century pentagonal tower encircled

by walls. Il Montale (13th cent.) was rebuilt in the 18th and 19th centuries and restored in 1935. The principal buildings are much restored. S. Francesco dates from 1361; the façade was transformed by 17th-century additions (1631; portico) and heightening during the 19th century; the original structure of the single-aisled interior is completely concealed by an 18th-century superstructure. There remain frescoes from the 14th-century school of Rimini. S. Pietro (16th cent.) was completely remodeled in the 19th century. The Basilica of S. Marino (1836; by Antonio Serra) is neoclassic; the interior is basilican, with nave and two side aisles, containing sculptures by Tadolini and others. The campanile is of the 14th century. Palaces of note are the Valloni (15th cent., with 17th-cent. wing) and the Neo-Gothic Palazzo del Governo (1894) by Francesco Azzurri. The Palazzo Valloni houses a museum with archaeological and numismatic collection, antique ceramics, and paintings, particularly from the 17th century.

Tuscany (It., Toscana). The preeminent position of Tuscany in the development of Italian civilization and its great wealth of monuments and works of art are largely the legacy of the Middle Ages and the Renaissance. Even in antiquity, however, it was the center of the Etruscan civilization, and the modern region corresponds mainly to that of the Etruscans, or Tusci, from whom the name Tuscany derives. (For southern Etruria, see *Latium*.) From these people there remains an architectural, monumental, and artistic heritage of the first importance. Many of the cities founded by them have led an uninterrupted existence to the present time. Other great cities, such as Florence and Siena, were founded by the Romans, whose domination began in the 4th century B.C. But in the 11th century many of the cities became independent communes, initiating the most flourishing period of Tuscan history. Romanesque architecture, drawing its inspiration from traditional classical forms, spread from the focal centers of Florence and Pisa; to this were added later Gothic forms. Sculpture received an impetus through the Pisan school, and medieval painting reached a high point during the 13th and 14th centuries in Florence and Siena. From the 15th century onward, Florence, as the center of activity of the great masters of the Renaissance, assumed a leading role in the world of art throughout the whole of Italy and Europe. So strong was the imprint of the Renaissance in Tuscany that baroque forms are relatively scarce. On the other hand, later developments such as neoclassicism, 19th-century painting, and modern architecture have had important results in Tuscany.

Arezzo (Lat., Arretium). Etruscan city, allied with Rome in the late 4th century, later a municipium, and, under the empire, a colonia. Of the Etruscan-Roman period there remain sectors of the walls, terra-cotta revetments from a 5th-century Etruscan temple, and traces of a number of potteries which produced the famous Arretine pottery during the 1st century B.C. and the 1st century of our era. Among the most important discoveries made in the city (in the 16th century) are the Etruscan Chimera (V, PL. 40) and a bronze statue of Minerva (now, Mus. Arch., Florence). The plan and appearance of the city are predominantly medieval; the oldest section, surrounded by walls, was modified at various times during the Renaissance. A modern quarter has been developed on the level ground to the southwest.

The most intensive period of building began in the mid-13th century. One of the most important Tuscan Romanesque churches, the Pieve di S. Maria (I, PL. 388), dates mainly from this period, although it was altered many times later. The façade, erected in the early 13th century, shows Pisan influences in its tiers of blind arches and horizontal coping. The sculptured portals of Lombard influence date from 1216–21. The interior has a nave and two aisles, with an open-trussed timbered ceiling, divided by columns supporting pointed arches. The presbytery is raised above the crypt. The high altar has a polyptych by Pietro Lorenzetti (IX, PL. 191). The massive rectangular campanile was completed in 1330. The most important group of secular Romanesque buildings, on the Piazza Grande, includes the Palazzo Pretorio (14th cent., restored in 1933), the Torre della Bigazza (1351), and the Palazzo del Comune (1333). The city contains many Gothic buildings. S. Domenico (1275) has a sculptured portal and, in the interior, 14th- and 15th-century frescoes by Arretine and Sienese artists and a Crucifix by Cimabue (III, PL. 320). The Cathedral was begun in the late 13th century in a transitional Romanesque-Gothic style, but construction went on in the 14th and 16th centuries and was completed in the present century. The interior has a long nave with two lateral aisles divided by Gothic arches on cruciform piers and ends in a polygonal apse with wide, double-arched windows. The stained-glass windows are mostly by Guglielmo de Marcillat (1518–20). Among the important monuments in the Cathedral are the tomb of Bishop Guido Tarlati by Agostino di Giovanni and Agnolo di Ventura of Siena (1330), the frescoes of the Sienese school in the Tarlati Chapel, the fresco *Mary Magdalene* by Piero della Francesca, and terra cottas by Andrea della Robbia in the Chapel of the Madonna del Conforto. S. Francesco, begun in 1322 in a Franciscan Gothic style, has a nave decorated with frescoes of the 14th and 15th centuries; in the Guasconi Chapel are frescoes by Spinello Aretino (III, PL. 311), and in the choir is the great fresco cycle *The Legend of the True Cross* by Piero della Francesca (XI, PL. 159). The Palazzo della Fraternità dei Laici, originally begun as a Gothic structure (1375–77), was enlarged in the 15th century on Renaissance lines by Bernardo Rossellino, who also began the sculpture on the façade (completed by Giuliano and Algozzo da Settignano, 1460). The Palazzo della Dogana, begun in 1445 by Donato di Leonardo Bruni, has been restored since 1945. The Church of the SS. Annunziata was begun in 1491 from designs by Bartolomeo della Gatta and completed in 1517 by Antonio da Sangallo the Elder. The interior, with three aisles divided by piers, has stained-glass windows by Guglielmo de Marcillat (1509) and works by Pietro da Cortona, Giorgio Vasari, Matteo Rosselli, and Spinello Aretino. S. Maria delle Grazie (PL. 191) has a nave with a groin-vaulted ceiling; the portico (late 15th century) is by Benedetto da Maiano.

Other structures of interest include the Palazzo delle Logge (1573–81) designed by Vasari; the church of the Badia (SS. Flora and Lucilla; 13th cent.), enlarged by Vasari, with works by Vasari and Benedetto da Maiano; S. Maria in Gradi, rebuilt by Bartolommeo Ammanati in 1592, incorporating the crypt of the old church (10th or 11th cent.); the Fortress of the Medici, designed by Giuliano and Antonio da Sangallo (16th cent.); and the Fontana Pubblica (16th cent.). A number of medieval churches have been rebuilt in modern times, including S. Michele (originally 13th cent.), S. Agnese (retaining part of the 11th-cent. façade), and S. Lorenzo. The Via di Borgunto, is a good example of a 16th-century city street. *Museums*: Pinacoteca and Museo dell'Arte Medioevale e Moderno, with works by medieval, Renaissance, and modern Tuscan artists; Museo Archeologico Mecenate (in the former Monastery of S. Bernardo), Etruscan and Roman art, and Arretine pottery; and the house of Giorgio Vasari (decorated by the artist), with the Vasari Archive and works by Tuscan mannerists. Monte San Savino, 14 miles southeast of Arezzo, is the birthplace of Andrea Sansovino. It has a number of buildings designed by the artist, and other Renaissance structures, including the Loggia del Mercato, designed jointly by Sansovino and Antonio da Sangallo the Elder.

Asciano. The site was inhabited in ancient times, as attested by an Etruscan underground burial place with urns and vases. The town has a medieval appearance and is surrounded by 14th-century walls. It was under Sienese domination from 1285 to 1554. The Collegiata (S. Agata) is a Romanesque church (11th cent.; interior restored). S. Agostino, originally Romanesque, was rebuilt in Gothic style. S. Francesco (14th cent.) is Romanesque-Gothic; the interior was remodeled in the 17th century. *Museums*: Museo di Arte Sacra, in the former church of the Compagnia della Sta Croce, with paintings of the 15th-century Sienese school; Museo Etrusco. *Environs*: Abbey of Monte Oliveto Maggiore, founded 1313, has a church built in 1400–17 but remodeled several times. Its interior was remodeled in 1772. The 15th-century Great Cloister is decorated with frescoes, the *Life of St. Benedict*, by Luca Signorelli (1497–1501) and Giovanni Antonio Bazzi (Sodoma; 1505–08). Buonconvento, founded in the 13th century, is surrounded by 14th-century walls and retains its medieval layout. The parish church, remodeled in the 18th century, contains the *Madonna and Child with Saints* by Matteo di Giovanni; adjoining is a museum with paintings of the Sienese school.

Certaldo. This town of the feudal period, surrounded by walls, developed around the castle of the Alberti, counts of Vernio. The old part, on a hill, retains its original medieval aspect, with fountains in the Sienese style, towers, and brick houses. The Church of SS. Michele e Jacopo (13th cent., restored) has a nave ending in a semicircular apse with a trussed ceiling. It adjoins a small 14th-century cloister. S. Tommaso (deconsecrated) is probably of the 13th century and retains a Romanesque-Gothic façade. The Palazzo del Vicariato (or Pretorio) was rebuilt in the 15th century, when the Loggia was added (restored, 1893). The Chapel of the Madonna della Tosse (formerly Tabernacolo dei Giustiziati) contains frescoes by Benozzo Gozzoli and Giusto d'Andrea (1466). The Casa di Boccaccio, said to have been the residence of the writer, is a reconstruction of the original. The Porta del Sole was remodeled in 1570.

Chiusi (Etruscan, Clevsin, Chamars; Lat., Clusium). One of the great Etruscan cities, dominating the Valdichiana, its most flourishing period was between the 7th and 5th centuries B.C. In the 4th century B.C. it became an ally of Rome and later a municipium. It was later a Lombard duchy, then passed under the successive dominations of Orvieto, Perugia, Siena, and finally Florence (1556). There are still traces of the ancient walls and a reservoir, and the city plan is Roman. The Etruscan necropolises were mostly situated on the hills surrounding the city (Poggio Renzo, Poggio Gaiella) and as far as the lake of Chiusi. Many of them are of monumental proportions, such as the so-called "Labyrinth of Porsenna" on the Gaiella hill. The Tomba della Scimmia, on Poggio Renzo (5th cent. B.C.), has several rooms, of which two are decorated with paintings. The Tomba della Pellegrina (3d–2d cent. B.C.) still retains its sarcophagi and cinerary urns. The Tomba del Granduca (3d–2d cent. B.C.) has a barrel-vaulted chamber lined with travertine slabs. The material recovered from these tombs is typical of the local artistic production. It includes canopic anthropomorphic cinerary jars, bucchero vases with decorations in relief, urns and sepulchral pillars with archaic carving, cinerary urns with statues and groups, painted pottery of the 4th and 3d centuries B.C., and even a considerable quantity of imported Attic pottery. There are also a few Early Christian catacombs (S. Mustiola and S. Caterina). The medieval buildings and monuments are few, and most of them have been remodeled in later times. The Cathedral, of Early Christian origin, was rebuilt in the 12th century and clumsily restored in the late 19th. The façade is neoclassic; the interior, of basilican plan, has ancient columns of different designs (probably from Roman buildings). It contains paintings by Bernardino Fungai and Benvenuto di Giovanni. In the sacristy is a collection of codices from the Abbey of Monte Oliveto Maggiore illuminated by Sano di Pietro, Liberale da Verona, Girolamo Bembo, and other 15th-century artists. The freestanding campanile (12th cent.) was altered in the 16th and 17th centuries. S. Francesco (13th cent.) has a portal and part of the façade of the Romanesque period. S. Maria della Morte (13th cent.) has been restored and partly rebuilt. There are also remains of a fortress from the late 12th century. The Museo Archeologico Nazionale contains an important collection of Etruscan art.

Cortona (Etruscan, Curtun; Lat., Cortona). Situated on a mountain spur overlooking the Valdichiana, Cortona was an important Etruscan city. It became an ally of Rome in the 4th century B.C. and later was a municipium. In the 13th century it became an independent commune, later subject to Arezzo and Siena; in 1411 it was sold to Florence. Of the Etruscan period there are several sections of the city walls, built of large stone blocks, without towers (5th cent. B.C.). Of the necropolises outside the city there remain the mounds (called *Meloni*) of Camucia and Il Sodo, and a circular monument of disputed date known as the "Tomb of Pythagoras." Among the important Etruscan finds are a great bronze sculptured lamp with figures of satyrs and sirens.

There are few Romanesque buildings. Parts of the old parish church (11th cent.) are incorporated into the Cathedral, rebuilt in the 15th and 16th centuries and enlarged in the 18th century. The portals are by Giuliano da Sangallo and Cristofanello Sensi. The interior has a nave and two aisles. The altar is by Francesco Mazzuoli, the canopy by Ciuccio di Nuccio (1491), and the apse contains a *Madonna and Saints* by Cigoli. The campanile dates from 1566. The Palazzo Comunale, already existing in the early 13th century, was remodeled in 1275 and enlarged in the 16th century. It still retains some of the original structure. The Palazzo del Popolo (13th cent.) was remodeled and enlarged in the 16th century. The Palazzo Pretorio (also 13th cent.) was rebuilt in late Renaissance style by Filippo Berettini (1608). One side is part of the original structure. S. Francesco (begun 1245) was remodeled in the 17th century. The interior contains works by Cigoli, an *Annunciation* by Pietro da Cortona, and a *Crucifixion* by Luca Signorelli. S. Domenico (late 14th–early 15th cent.) has a simple façade with Gothic elements; the interior has a nave ending in three rectangular apses. It contains works by Signorelli, Lorenzo di Niccolò Gerini (1402), and Bartolomeo della Gatta.

During the Renaissance, two churches were built outside the city. The Madonna del Calcinaio (1485–1513) was built from designs by Francesco di Giorgio Martini. It is a Latin cross with an octagonal dome. S. Maria Nuova (1550–54), designed by Cristofanello Sensi, is square, with a hemispherical dome. The square Medici Fortress (Grifalco), designed by Francesco Laparelli (1549), overlies the ruins of Etruscan walls and a 14th-century fortress.

Modern structures include the Sanctuary of St. Margaret of Cortona (begun 1856) in neo-Romanesque style, containing the tomb of St. Margaret by Angelo and Francesco di Pietro (1362). Nearby is the *Via Crucis*, in mosaic from designs by Gino Severini. *Museums*: The Accademia Etrusca, with the Museo dell'Accademia Etrusca, containing Etruscan and Egyptian antiquities; Diocesan Museum, annexed to the former Church of the Gesù, with works by Pietro Lorenzetti, Fra Angelico, Sassetta, and Signorelli.

Cosa (Lat., Ansedonia). Situated on a hill overlooking the sea, south of Orbetello, Cosa was founded as a Roman colonia and port in 273 B.C., possibly as a harbor for Vulci. Now in ruins, it retains traces of girdle walls, of polygonal stone blocks, fortified with 18 towers, and the orthogonal plan of the city. The forum was at the center, with a triple-arch propylaeum, a basilica, and an aerarium. The *capitolium* was at the summit of the acropolis, separated from the rest of the city by an inner wall, which also enclosed two temples (early 2d cent. B.C.).

On the island of Giglio (Lat., Igilium), inhabited from the Iron Age on, are the remains of a Roman villa of the Domitii Ahenobarbi, built in the 1st century B.C. and enlarged in the 1st century of our era. Remains of another Roman villa, probably contemporary with the villa at Giglio and belonging to the same family, are on the island of Giannutri.

Elba (Gr., Aethalia; Lat., Ilva). The largest island of the Tuscan archipelago, it was occupied by the Etruscans of Populonia, then in the 5th century, B.C., by the Syracusan Greeks, and thereafter by the Romans, who founded a number of colonies. In the early Middle Ages it belonged to the duchy of Tuscany, was conquered by the Saracens, and then belonged in turn to Pisa, Lucca, Genoa, Spain, and France. The capital city is Portoferraio, already existing in the 4th century B.C. and called by the Romans Fabricia. In its present form it dates from the reign of Cosimo I, who acquired it in 1548 and laid out a new town from plans by Giovanni Battista Bellucci. Fortifications were built, of which the forts of Falcone and Stella, on the high ground, still exist in a fairly good state of preservation. The maritime fort of Linguella is now half destroyed. Buildings of interest include the Church of the Misericordia (1566) and the Casa dei Mulini, originally formed by two mills, enlarged and decorated in neoclassic style as a residence by Napoleon I (1814). The Pinacoteca Comunale Foresiana (in the former Villa Demidoff) contains paintings and historical objects (mostly Napoleonic) of the 17th, 18th, and 19th centuries. In the vicinity are the Villa San Martino, Napoleon I's summer residence, remodeled several times in neoclassic style, now the Napoleonic Museum; the Volterraio, a ruined Pisan fortress; and the ruins of the Church of S. Stefano, of the 12th–13th century. Among the other towns on the island are Porto Azzurro (formerly Porto Longone), with a 17th-century Spanish fortress; Marciana Marina, with a tower known as "Torre Medicea"; and Marciana, with a ruined castle of the Appiani.

The other islands of the archipelago are Gorgona (with a Pisan fortress of the 13th century, now restored), Capraia (with the 15th-century fortress of San Giorgio), and Montecristo (with ruins of a fortress and an abbey).

Bibliog. F. Gregorovius, Die Insel Elba, Leipzig, 1883; E. Giannitrapani, Elba, Rome, 1940; G. Monaco, Elba: Villa romana, FA, XIII, 1958, 4133.

Empoli. The city grew up around the parish church of S. Andrea after 1119. It came under Florentine rule in 1182 and was the scene of many important events of Florentine history in the 13th and 14th centuries. Sacked twice in the 16th century, it has lost much of its medieval character. The most important medieval church is the Romanesque Collegiata (S. Andrea), built in 1093, possibly on the site of a 5th-century church. The façade has a geometric pattern in white and green marble (upper part, 18th cent.). The interior of the church (remodeled in the 18th century; restored after World War II) had a baptismal font of the school of Donatello (now in the Galleria). S. Stefano (14th cent.; remodeled several times) has a fresco by Masolino in the lunette above the sacristy door. The Church of the Madonna del Pozzo dates from 1621. The Galleria della Collegiata contains works by Lorenzo Monaco, Filippino Lippi, Masolino, Francesco Botticini, Mino da Fiesole, Antonio Rossellino, Pontormo, and other Tuscan artists.

Bibliog. L. Lazzeri, Storia d'Empoli, Empoli, 1873; G. Bucchi, Guida d'Empoli illustrata, Florence, 1906; O. A. Giglioli, Empoli artistica, Florence, 1906; I. B. Supino, Gli albori dell'arte fiorentina (Empoli, S. Andrea), Florence, 1906; A. Morelli, Guida . . . di Empoli, Bologna, 1959.

Fiesole (Lat., Faesulae). On the summit of a hill, north of Florence, it was an Etruscan acropolis which dominated the small Etruscan settlements in the middle Arno valley, known for their production of carved funerary steles in the archaic period. In the 4th and 3d centuries B.C. it became a city. Destroyed in the Social War, it was repopulated by Sulla in 80 B.C. In the early Middle Ages, under the Lombards and Carolingian Franks it was ruled by bishops and was a flourishing city, but gradually it came under Florentine domination and was destroyed as a political power by Florence in 1125. Of the Etruscan period are the walls (pseudo-isodomic) which enclosed an Italic temple *ad alae*, the remains of which belong to the 6th, 5th, and 1st centuries B.C. The Roman theater has a *cavea* of the 1st century B.C. Of the Sullan city is a bath with an aqueduct and traces of a forum and of the *capitolium*. The Cathedral is Romanesque, enlarged in the 13th and 14th centuries and restored in 1883. It has a tripartite nave divided by columns with ancient capitals. The presbytery is raised above a crypt. The high altar has a triptych by Bicci di Lorenzo, and the Salutati Chapel contains frescoes by Cosimo Rosselli and sculptures by Mino da Fiesole. The campanile was built in 1213. The Palazzo Pretorio (now Comunale) is of the 14th century but has been altered several times. S. Francesco, also of the 14th century, but remodeled at various periods, has a unitary nave. The oratory of S. Maria Primerana, with a single aisle, has decorations of the 14th, 15th, and 16th centuries, rather radically restored. The Oratory of Sto Sepolcro contains 14th-century frescoes. S. Alessandro was built in the Early Christian period over an Etruscan, later Roman, temple. It was remodeled in the 11th century, and rebuilt in the 16th, 18th, and 19th centuries. The Seminary was built in the 17th century. The adjoining Palazzo Vescovile, originally of the 11th century, was rebuilt at the same time. *Museums*: Museo Fiesolano, with antiquities excavated in the Fiesole district; Museo Bandini, with paintings by 14th- and 15th-century Tuscan artists.

On the road between Florence and Fiesole is the Church and Monastery of S. Domenico, founded in 1406 and later enlarged. The portico on the façade and the campanile were designed by Matteo Nigetti in the 17th century. The interior of the church contains works by Lorenzo di Credi. In the chapter house of the monastery there is a fresco of the *Crucifixion* by Fra Angelico. Near S. Domenico is the Badia Fiesolana with a façade of inlaid marble in two colors (III, PL. 388). The design is geometric, similar to the design of S. Miniato in Florence. The church was remodeled and then rebuilt in the manner of Brunelleschi, on the plan of a Latin cross, in 1459–66. The frescoes in the refectory are by Giovanni da San Giovanni.

The neighborhood of Fiesole contains many villas, among which are Villa Salviati, originally a 14th-century castle, transformed into a Renaissance villa by Giuliano da Sangallo; Villa Medici (Belcanto), designed by Michelozzo in 1458–61; and Villa Rondinelli Vitelli (16th cent.). Also near Fiesole is the Convent of S. Maria Maddalena (15th cent.) with frescoes by Fra Bartolomeo.

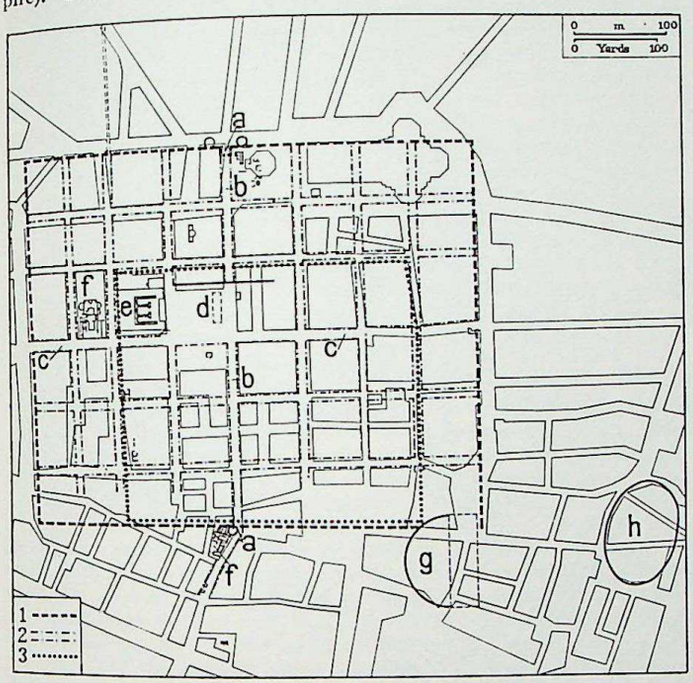
Florence (It., Firenze; Lat., Florentia). Florence was founded in the Roman period on a previously inhabited site on the Arno River. In the 3d and 2d centuries B.C. Florentia was a municipium, later becoming a colonia. Under the empire it was an important city, the seat of the Corrector Italiae (3d cent.). In the Middle Ages it grew in size and importance, especially after the establishment of the commune in 1115, reaching its apogee under the *Signoria* of the Medici in the 15th century, when it was one of the leading economic and artistic centers of Europe.

The central part of the city still retains traces of the rectangular Roman plan, with a central forum (Piazza della Repubblica), and remains of the *capitolium* (2d–1st cent. B.C., restored under the empire). There are a few traces (mostly out of view) of baths, a theater,



Florence, plan of the ancient city. *Key*: (1) Walls of the Roman period; (2) course of the Roman streets; (3) walls of the Byzantine period. Principal monuments: (*a*) gates; (*b*) *cardo maximus*; (*c*) *decumanus maximus*; (*d*) forum; (*e*) *capitolium*; (*f*) baths; (g) theater; (*h*) amphitheater.

and an amphitheater. The fusion of the compact layout of the medieval city with the more spacious Renaissance elements is perfect, and it is only since 1860, and especially since World War II (which wrought much irreparable damage), that this organic unity of the city has been compromised.

The perimeter of the earliest medieval walls (late 7th cent.) followed (with a few variants) that of the Roman walls. It formed a rectangle which enclosed the area between the Arno River and the present Piazza del Duomo, Via Tornabuoni, and Via del Proconsolo. The walls of 1172 enclosed a larger rectangle, following the river between the Carraia (1220) and Rubaconte (Ponte alle Grazie, 1237) bridges, and included an area across the Arno as far as Sto Spirito and the Pitti Palace. A third wall, built in the 13th and 14th centuries still partly exists on the south bank of the Arno. On the north it followed the circle of the modern boulevards (Circonvallazione) laid out in 1865–71, as part of the city plan of Giuseppe Poggi (who also laid out the Viale dei Colli).

There are practically no vestiges of Early Christian or early medieval buildings: they were demolished or rebuilt in the course of later enlargements of the city. The oldest important monuments date from the early period of the commune. The Baptistery (consecrated 1059; I, PL. 302) is octagonal, and the outer walls are faced with white and green marble in geometric patterns. The small tribune (*scarsella*; X, PL. 188) and the upper story are 13th-century additions. The bronze doors are by Andrea da Pontedera (Pisano; I, PLS. 228–230) and Lorenzo Ghiberti (II, PL. 290; VI, PLS. 169–174, 177). The interior of the dome and of the *scarsella* are decorated with mosaics of strong Byzantine and Roman influences (III, PLS. 12, 490). The tomb of the antipope John XXIII (III, PL. 13) is by Donatello and Michelozzo (1422–27). Also by Donatello (a late work) is the statue of St. Mary Magdalene (III, PL. 211). The façade of S. Miniato al Monte (11th–13th cent.) is also faced with white, black, and green marble in geometric designs. The lower part is a five-arched blind portico, with a 13th-century mosaic. The interior is basilican in form, with a trussed ceiling and a raised presbytery over an 11th-century crypt. The inlaid marble floor of the nave, the *schola cantorum*, the liturgical objects, and the pulpit (PL. 182) date from 1207. The sacristy is decorated with frescoes by Spinello Aretino and others. The Renaissance shrine of the Crucifix at the end of the nave is by Michelozzo. The Chapel of the Cardinal of Portugal (1461–66) was designed by Antonio Manetti and is decorated with works by Antonio Pollaiuolo, Alessio Baldovinetti, and Luca della Robbia; the cardinal's tomb is by Antonio Rossellino. In the cloister are remains of frescoes by Paolo Uccello. SS. Apostoli (11th cent., rebuilt 15th cent.) is in basilican form, with a nave and two side aisles divided by arches on green marble columns with capitals in classic style (PL. 182). It contains works by Giovanni della Robbia, Pomarancio, and Bartolommeo Ammanati. S. Pietro Scheraggio (consecrated 1068) is now incorporated in the Palazzo degli Uffizi. It was built over an older 9th-century church, but now lacks the nave and has been altered a number of times. Other Romanesque churches retaining some original elements are S. Jacopo sopr'Arno and S. Salvatore al Vescovo.

The first Gothic elements were introduced into Florence from across the Alps in the 13th century. They are seen in the Church of S. Maria Novella, begun about 1278 and completed about 1360, on the site of a 10th-century oratory enlarged in the 11th and 12th centuries. The façade (I, PL. 53) was designed by Leon Battista Alberti (completed 1470). The interior (VI, PL. 334) is a Latin cross, with a rectilinear apse flanked by rectangular chapels. The Gothic vaulted ceiling is supported by composite piers and arches. It contains works by Giotto, Spinello Aretino and his pupils, Nardo di Cione, Andrea di Cione (Orcagna), and Masaccio. The choir is decorated with a cycle of frescoes by Domenico Ghirlandajo and his assistants; the Strozzi Chapel has frescoes by Filippino Lippi (IX, PLS. 147, 148). The sculptures are by Lorenzo Ghiberti (1423), Filippo Brunelleschi, Bernardo Rossellino, and Giambologna. Adjoining the church is the Dominican monastery. The Chiostro Verde (second half of the 14th century) is decorated with frescoes by Paolo Uccello (XI, PLS. 37, 38, 41). The chapter house, also known as the Spanish Chapel (Cappellone degli Spagnoli), was designed by Jacopo Talenti after 1350, with frescoes by Andrea da Firenze (II, PL. 364; III, PL. 314). Sta Croce was begun in the late 13th century, replacing a small church founded in 1228. The design is attributed to Arnolfo di Cambio. The façade was built in 1853–63. The interior (I, PL. 463) has a tripartite nave, divided by octagonal piers with pointed arches, and a transept. The ceiling is trussed. The polygonal apse has 10 lateral chapels (5 on each side) decorated with frescoes by Giotto (Bardi and Peruzzi chapels; VI, PLS. 206–208), Taddeo Gaddi (Baroncelli Chapel; PL. 183; VI, PL. 380), Agnolo Gaddi (Castellani Chapel and choir; VI, PL. 380), Giovanni da Milano (Rinuccini Chapel; VI, PL. 62), Bernardo Daddi (Pulci and Berardi Chapel; IV, PL. 106), and Maso di Banco (Bardi di Vernio Chapel; IX, PLS. 369–371). The church contains important Renaissance sculptures, including the *Annunciation* by Donatello (ca. 1435), the pulpit by Benedetto da Maiano (1472–76), the monument to Leonardo Bruni by Bernardo Rossellino, and the monument to Carlo Marsupini by Desiderio da Settignano. In 1434 Michelozzo built the Chapel of the Novitiate adjoining the sacristy, adorned with reliefs by the school of Donatello and a reredos by Andrea della Robbia. In the course of later centuries the church was enriched with works by Santi di Tito, Bronzino, Vasari, and Canova. Sta Trinita, begun in 1258, possibly by Nicola Pisano (on the site of an 11th-century church, of which vestiges are visible in the crypt), was enlarged in the 14th century. The façade is by Bernardo Buontalenti (1593–94). The nave is tripartite, with Gothic arches and a cross-vaulted ceiling. There are lateral chapels on the right and left aisles and at the head of the transept. The church contains a cycle of frescoes and a panel painting by Lorenzo Monaco. The Sassetti Chapel is decorated with frescoes by Domenico Ghirlandajo and assistants (VI, PLS. 180, 182, 183). There are also works by Giuliano da Sangallo, Neri di Bicci, Desiderio da Settignano, Benedetto da Maiano, and Luca della Robbia. The Church of the Badia (founded 978) was rebuilt in the 13th century and remodeled in the 17th. Of the 13th-century structure, partly attributed to Arnolfo di Cambio, there are some remains; the hexagonal cusped campanile is of the 14th century. In the interior (remodeled 17th cent.) are traces of 14th-century frescoes, sculptures by Mino da Fiesole (PL. 192), and paintings by Filippino Lippi (IX, PL. 149), Giorgio Vasari, and others. The adjoining Chiostro degli Aranci (15th cent.) is possibly attributable to Benedetto da Maiano.

The Cathedral (S. Maria del Fiore) was begun in 1296, from plans by Arnolfo di Cambio (I, FIG. 762). The nave is tripartite, with piers and Gothic arches, and a trefoil apse by Francesco Talenti. In 1357 Talenti enlarged the original plan. The building was completed in 1461, when Brunelleschi's dome (1418–34; II, PL. 365) was crowned with the lantern. The original façade, modified by Talenti,

was demolished in 1588; the present façade (19th cent.) was built by Emilio de Fabris (X, PL. 295). The exterior is faced with polychrome marble in geometric patterns on traditional Florentine Romanesque lines. The lateral portals are decorated with sculptures (e.g., PL. 184; I, PL. 306). The interior has stained-glass windows designed by Paolo Uccello, Andrea del Castagno, Lorenzo Ghiberti, and Donatello. It contains works by Bernardo Daddi, Tino di Camaino, Paolo Uccello, Andrea del Castagno, Lorenzo Ghiberti (VI, PL. 176), and Michelangelo (IX, PL. 526). Giorgio Vasari and Federico Zuccari decorated the interior of the dome. The two sacristies open from each side of the tribune. The Old Sacristy (of the Canons) has a portal with a lunette by Luca della Robbia, who also designed the two angel candelabra in the interior. The New Sacristy (of the Mass) has a portal with a lunette and a bronze door by Luca della Robbia (IV, 158, 159). The inlaid cupboards were carved by Antonio Manetti and Giuliano da Maiano, from designs by Alessio Baldovinetti and Maso Finiguerra (PL. 83). The freestanding campanile was designed and begun by Giotto in 1334, continued by Andrea da Pontedera and Francesco Talenti (completed ca. 1359). It is a rectangular tower, without spire or cusp, in five stages, marked by stringcourses. There are two orders of double-arched windows and one order of triple-arched windows above (by Talenti). The facing of polychrome marble is similar to that of the Cathedral. The lower course is decorated with a series of hexagonal reliefs by Andrea da Pontedera (I, PLS. 231, 232), Nanni di Bartolo, and Luca della Robbia (IV, PL. 160). Above these are a series of niches with copies of statues of prophets and sibyls by Andrea da Pontedera, Donatello, and Nanni di Bartolo (originals now in Mus. dell'Opera del Duomo; I, PL. 233; IV, PL. 243).

S. Maria Maggiore, in existence before the 11th century, was rebuilt in the 13th century. The façade was remodeled by Buontalenti in the 16th century. The interior is decorated with 13th- and 14th-century frescoes. S. Ambrogio (possibly built on the site of a 6th-century church) has been altered and restored several times. It contains works by Alessio Baldovinetti, Cosimo Rosselli, and Mino da Fiesole. Orsanmichele (S. Michele in Orto) was originally a loggia for the grain market, built by Arnolfo di Cambio in 1290. It was rebuilt after a fire in 1337, and in 1380 it was transformed into a church, and an upper floor to be used as a granary was added. The interior is divided into two aisles with hemispherical vaulting and contains a marble tabernacle by Andrea di Cione (Orcagna; X, PL. 392). On the exterior are a number of shrines with sculptures of the patron saints of the various guilds (*Arti*) of the city by Lorenzo Ghiberti (VI, PL. 175), Nanni di Banco (III, PL. 391), Donatello, and Verrocchio.

There are remains of a number of 13th-century tower houses in the medieval quarter which surrounds the Palazzo del Podestà (the Bargello; PL. 184), now the Museo Nazionale. This three-storied building with a high crenelated tower was begun in 1254. It is built around a central porticoed courtyard, with an open staircase leading to a porch and a loggia on the second story. The chapel of the Podestà is decorated with 14th-century frescoes of the school of Giotto. The construction of the Palazzo Vecchio (dei Priori, or della Signoria; I, PL. 396; VI, PL. 339) began in 1298 from plans probably by Arnolfo di Cambio. It has three stories surmounted by a crenelated gallery and a tower 308 ft. high. On the south side of the Piazza della Signoria is the Loggia della Signoria (Loggia dei Lanzi) built by Benci di Cione and Simone Talenti (ca. 1376–80). It consists of three wide arcades, with round arches decorated with lobed enameled plaques designed by Agnolo Gaddi. The Tribunale della Mercanzia (14th cent.; restored, 19th cent.) is on the east side of the square. In 1308 the guild of wool merchants built their own palace (Arte della Lana) near the Piazza della Signoria (restored, 1905). Also of the early 14th century (enlarged, 15th cent.) is the Palazzo dei Capitani di Parte Guelfa. Of the second half of the 14th century are the Loggia del Bigallo and the Loggia of the Accademia, formerly the Hospital of S. Matteo. Good examples of 14th-century patrician domestic architecture are the Palazzo Davanzati (PL. 100), a three-story brick building (loggia on top story, 15th cent.), which has retained the interior arrangement of rooms, and the Palazzo Spini-Ferroni, also of three stories (restored, 19th cent. and now in its original form). The so-called "Houses of the Alighieri," of the same period, have been restored and remodeled almost beyond recognition. Of the 14th-century walls, several gates still stand, including the Porta S. Giorgio, Porta S. Niccolò (both built in 1324), Porta Romana (1326), and the Porta S. Frediano (1332), which is now isolated. The Ponte Vecchio, with three spans, and small shops on each side, was rebuilt in 1345.

During the period of the rule of the Medici, in the 15th and 16th centuries, the city increased in size, population, and wealth, and many important secular and religious monuments were erected. Brunelleschi's (q.v.) solutions of architectural and urban problems based on his study of classic Roman architecture heralded the great Humanistic era of the Renaissance. His most famous work is the dome of the Cathedral (II, PL. 365; FIG. 655). His Barbadori (Capponi) Chapel in the Church of S. Felicita (1418) was somewhat mutilated by remodeling in 1736. The Ospedale degli Innocenti, designed by Brunelleschi (constructed 1421–44), has a porticoed façade (II, PL. 366) with semicircular arches outlined in gray sandstone and decorated with enameled terra-cotta medallions by Andrea della Robbia. This façade served as a model for the others around the Piazza della SS. Annunziata. Brunelleschi also enlarged the Palazzo di Parte Guelfa in 1420. About 1429 he designed the Pazzi Chapel (II, PLS. 367, 368) of Sta Croce, on a rectangular plan, with a hemispherical dome above the tribune (II, FIG. 662); the frieze on the outer architrave of the pronaos is by Desiderio da Settignano; the interior is decorated with glazed terra cottas by Luca della Robbia and Brunelleschi and stained-glass windows designed by Alessio Baldovinetti. Brunelleschi began the Rotunda of S. Maria degli Angeli (II, FIG. 659) about 1434, but it remained unfinished. S. Lorenzo, on the site of two earlier churches, was rebuilt on plans by Brunelleschi (1418; II, FIG. 654) in 1422–46 (with later additions). The interior (II, PLS. 369, 370) contains works by Filippo Lippi, Desiderio da Settignano, Donatello and pupils, Il Rosso, and Bronzino. Brunelleschi at the same time designed the Old Sacristy of S. Lorenzo on a square plan surmounted by a dome (II, PL. 368), completed in 1428. It is decorated with stuccoes, bronze doors, and terra cottas by Donatello and contains the tombs of Giovanni and Piero de' Medici by Andrea Verrocchio. The New Sacristy was begun in 1520 by Michelangelo, who designed and carved the tombs of Giuliano and Lorenzo de' Medici. Beyond the cloister is the Biblioteca Laurenziana, also by Michelangelo, entered through a vestibule with a wide stairway (1524). Sto Spirito, begun by Brunelleschi in 1444 (II, PLS. 370, 371), completed much later by Antonio Manetti, is a basilica with a tripartite nave and lateral semicircular chapels (one designed by Andrea Sansovino) on a higher level. It contains works by Bernardo Rossellino, Filippino Lippi, and Cosimo Rosselli. The sacristy, reached by a rectangular vestibule with a barrel-vaulted ceiling by Simone del Pollaiuolo (Il Cronaca), was designed by Giuliano da Sangallo (1489–92). The Palazzo Pitti (II, PL. 372) was designed by Brunelleschi and later enlarged by Ammanati, who built the courtyard. Built of rusticated ashlar, it was the first of a series of palaces of the rich and noble families. Among these are the Palazzo Rucellai (I, PL. 55), built by Bernardo Rossellino (1446–51) from plans by Leon Battista Alberti; the Palazzo Medici-Riccardi (1444–60), by Michelozzo, with frescos by Benozzo Gozzoli in the chapel; the Palazzo Gondi (1480–94), by Giuliano da Sangallo; and the Palazzo Panciatichi Ximenes, by Giuliano and Antonio da Sangallo (ca. 1499, later remodeled). Brunelleschi received the commission to design the Palazzo Pazzi (later Quaratesi; II, PL. 373), which was actually built by Giuliano da Maiano in 1462–72. The Palazzo Strozzi is by Benedetto da Maiano, with a cornice by Il Cronaca.

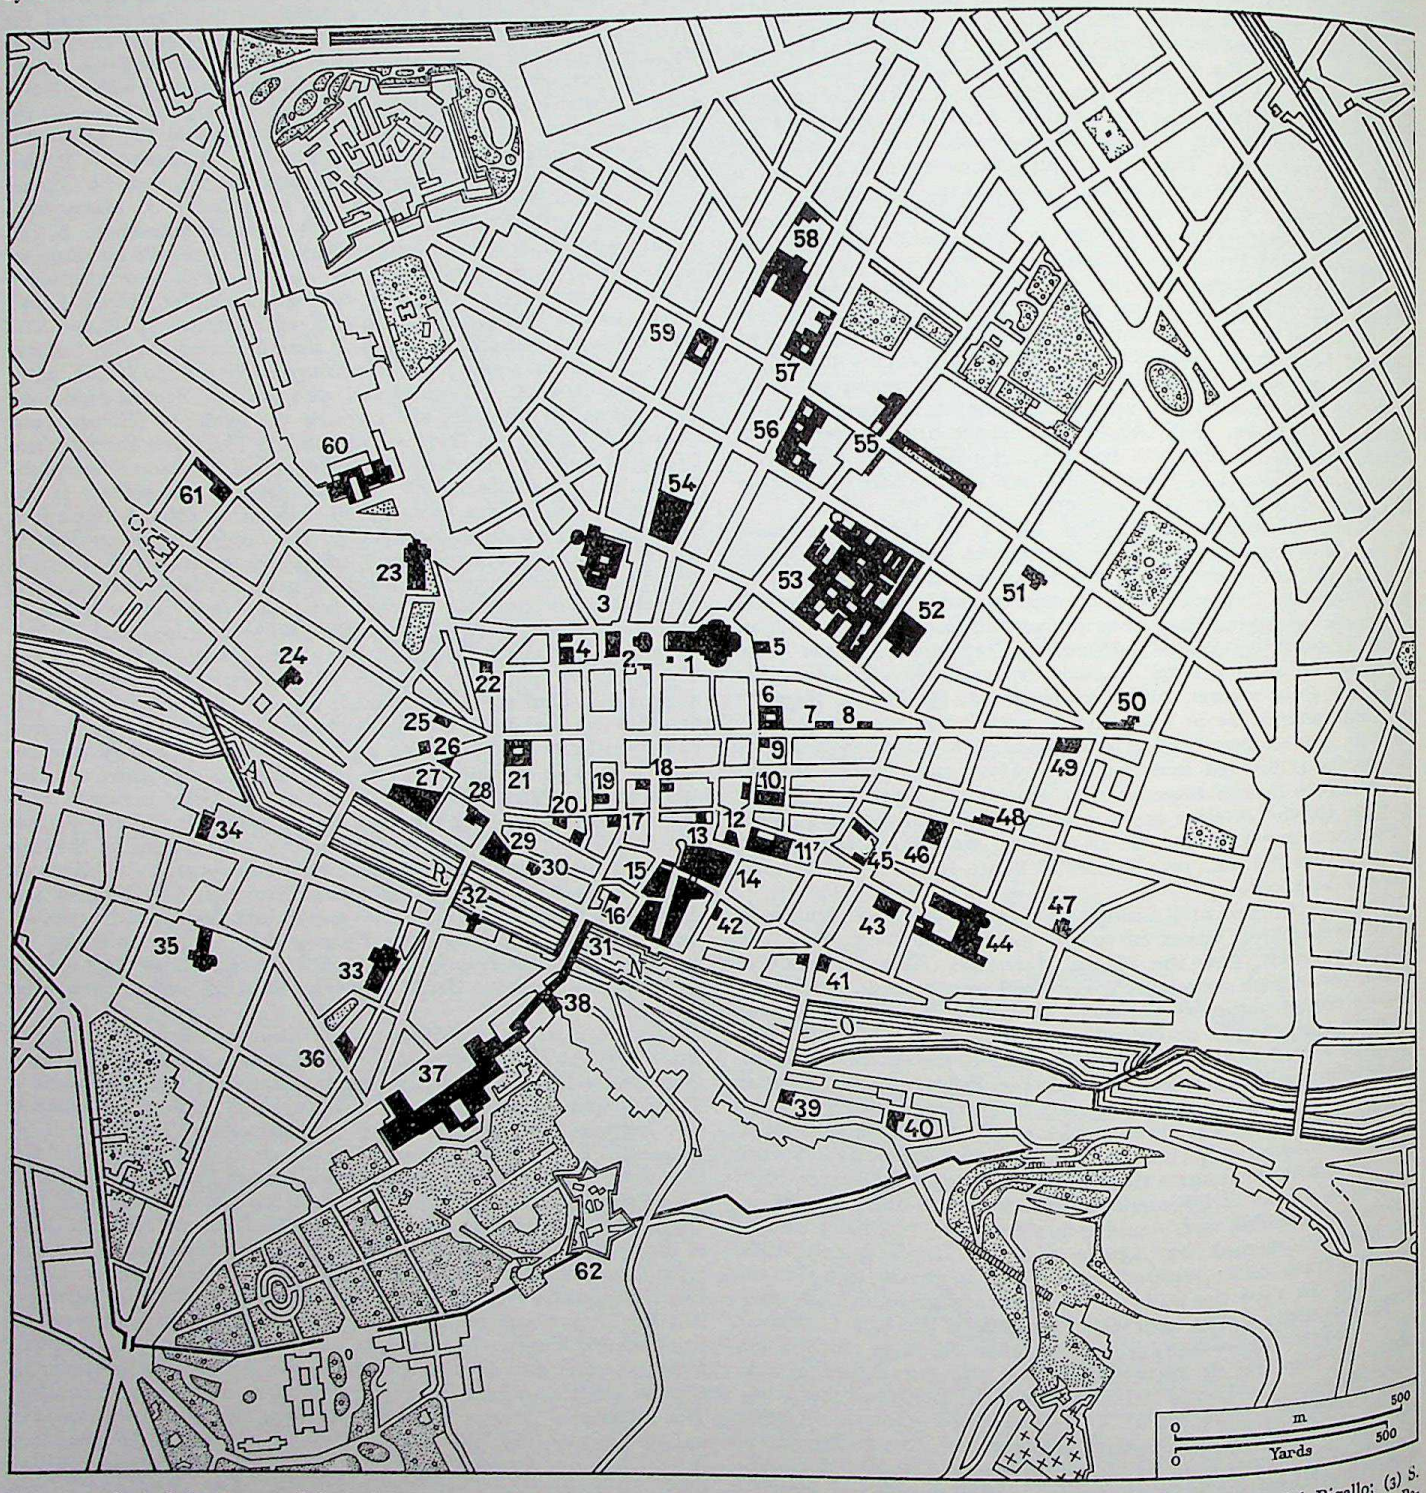
In the Palazzo Vecchio work was resumed during the Renaissance period. The courtyard, remodeled by Michelozzo, with a fountain by Verrocchio, was further decorated in the 16th century. The Salone dei Cinquecento was designed by Il Cronaca and adorned with frescoes by Giorgio Vasari and assistants. The *studiolo* of Francesco I (PL. 103), designed by Vasari and V. Borghini, was decorated with stuccoes, paintings, and statues by mannerist artists. The Sala dei Duecento, the Sala dell'Udienza, and the Sala dei Gigli were designed by Benedetto and Giuliano da Maiano. Also of the 15th century are the shrine of the Holy Sepulcher in the Rucellai Chapel (I, PL. 50) and the tribune of the SS. Annunziata by Leon Battista Alberti (I, PL. 58). Founded in the 13th century, SS. Annunziata was rebuilt by Michelozzo (1444–81) and later altered several times. The portico, in the manner of Brunelleschi, leads into a cloister decorated with frescoes by Alessio Baldovinetti, Cosimo Rosselli, Andrea del Sarto, Pontormo, and Rosso Fiorentino. The interior is baroque (remodeled, 1857), with a carved wooden ceiling designed by Volterrano. The shrine of the Annunciation (15th cent.) was designed by Michelozzo. The church also contains works by Andrea del Castagno (I, PLS. 236, 237), Bernardo Rossellino, Veit Stoss, and others. The adjoining Great Cloister (Chiostro dei Morti), designed by Michelozzo and built by Pagno Portigiani, contains the *Madonna del Sacco* by Andrea del Sarto (I, PL. 255). The Dominican monastery and Church of S. Marco, founded in the 13th century, were enlarged and rebuilt by Michelozzo in the 15th century. The church, remodeled by Giambologna (16th cent.) and later altered, has a baroque façade. The sacristy and cloister were built by Michelozzo. The monastery has frescoes by Fra Angelico (I, PLS. 266, 272), who also decorated the chapter house. The small refectory contains a *Last Supper* by Domenico Ghirlandajo. S. Felice, a 13th-century church, remodeled in the 14th and 15th centuries, has a façade by Michelozzo and frescoes in the interior by Giovanni da San Giovanni. S. Maria Maddalena dei Pazzi, founded

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

in the 13th century, was rebuilt by Giuliano da Sangallo in 1480–92 and remodeled in the 17th century; in the chapterhouse of the adjoining convent is a fresco *Crucifixion* by Perugino. S. Salvatore al Monte (PL. 191) was built by Il Cronaca in 1475, but subsequently remodeled. The Cenacolo di S. Apollonia has fresco decorations by Andrea del Castagno and is now the Castagno museum, with frescoes by the artist from other locations (I, PLS. 238, 240–245). The Brancacci Chapel of S. Maria del Carmine contains frescoes by Masolino (IX, PL. 374), Masaccio (IX, PLS. 347–350), and Filippino Lippi.

In the 16th century, while architecture continued to develop the 15th-century forms, Michelangelo was active in devising new forms, not only in the complex of structures of S. Lorenzo but also in the plan for the fortress of S. Miniato (1530–33), later transformed by Francesco da Sangallo. Other 16th-century fortresses are the For-



Florence, plan of the center. Principal monuments: (1) Cathedral and campanile; (2) Baptistery, Palazzo Arcivescovile, and Loggia del Bigallo; (3) S. Lorenzo, the Medici tombs, and the Biblioteca Laurenziana; (4) S. Maria Maggiore and Palazzo Orlandini; (5) Museo dell'Opera del Duomo; (6) Palazzo Nonfinito; (7) Palazzo Altoviti; (8) Palazzo Albizi; (9) Palazzo Pazzi; (10) Palazzo del Podestà (Museo Nazionale del Bargello) and Badia Fiorentina; (11) S. Firenze; (12) Palazzo Gondi; (13) Palazzo Uguccioni; (14) Palazzo Vecchio (della Signoria); (15) Palazzo degli Uffizi and Loggia della Signoria; (16) S. Stefano al Ponte; (17) Logge del Mercato Nuovo; (18) Orsanmichele and S. Carlo dei Lombardi; (19) Palazzo dell'Arte della Lana; (20) Palazzo Davanzati and Palazzo dei Capitani di Parte Guelfa; (21) Palazzo Strozzi; (22) Palazzo Antinori; (23) S. Maria Novella; (24) Ognissanti; (25) Rucellai Chapel; (26) Palazzo Rucellai; (27) Palazzo Corsini; (28) Sta Trinita; (29) Palazzo Spini-Ferroni; (30) SS. Apostoli; (31) Ponte Vecchio; (32) S. Jacopo sopr'Arno, near the Ponte Sta Trinita; (33) Sto Spirito; (34) S. Frediano; (35) Church of the Carmine; (36) Palazzo Guadagni; (37) Palazzo Pitti and Boboli Gardens; (38) S. Felice; (39) Museo Bardini; (40) S. Nicolò sopr'Arno; (41) Fondazione Horne and Palazzo Bardi; (42) Loggia del Grano; (43) Casa dell'Antella; (44) Sta Croce, Museo dell'Opera, and Pazzi Chapel; (45) S. Simone and Palazzo Serristori; (46) Palazzo Pepi; (47) S. Giuseppe; (48) Casa Buonarroti; (49) Loggia del Pesce; (50) S. Ambrogio; (51) S. Maria Maddalena dei Pazzi; (52) Teatro della Pergola; (53) Arcispedale di S. Maria Nuova, Church of S. Egidio, and Rotunda of S. Maria degli Angeli; (54) Palazzo Medici-Riccardi; (55) Piazza della SS. Annunziata, portico of the Ospedale degli Innocenti, and Palazzo della Crocetta (Museo Archeologico); (56) Galleria dell'Accademia di Belle Arti; (57) Church and Monastery of S. Marco (Museo di S. Marco); (58) Casino Mediceo, Cloister of the Scalzo, Church of S. Giovannino dei Cavalieri, and Palazzo Pandolfini; (59) Cenacolo di S. Apollonia; (60) central station; (61) Palazzo Ginori-Venturi; (62) Forte di S. Giorgio (Belvedere) and remains of the 14th-century walls.

tezza da Basso, by Antonio da Sangallo the Younger (ca. 1535), and the Forte di S. Giorgio (Belvedere), built between 1590 and 1595 by Giovanni de' Medici and Bernardo Buontalenti. Private palaces and public buildings of the period include the Palazzo Pandolfini, designed by Raphael (ca. 1520); Palazzo degli Uffizi (1560–85), begun by Giorgio Vasari and completed by Alfonso Parigi and Buontalenti; and the Logge del Mercato Nuovo, by Giovanni Battista del Tasso (1551). Ammanati enlarged the Palazzo Pitti, adding the inner wings around the courtyard (1570). He also built the Bridge of Sta Trinita (1569, rebuilt after its destruction in 1944 with the original material), the fountain in the Piazza della Signoria (PL. 210), the Vitali and Mondragone palaces, and the façade of the Church of S. Giovanni Evangelista. Bernardo Buontalenti remodeled the House of Bianca Cappello (1570–74) and parts of the Palazzo Nonfinito (1593). The Casa Buonarroti, with late mannerist decorations, is also of this period. The streets which have retained the character of the Renaissance city are the Via Maggio, Via Tornabuoni, Borgo Santi Apostoli, the streets between Borgo Albizi and Via Ghibellina, Borgo Sta Croce and Via de' Ginori. Also of the Renaissance are the gardens of Villa di Castello, laid out by Tribolo, and the Boboli Gardens, begun by Tribolo in 1550 and continued by Ammanati and Buontalenti (PLS. 429–431).

Florence contains few baroque or 18th-century buildings, and many of them are older edifices remodeled. The most prominent Florentine baroque architect was Matteo Nigetti, who built the Oratory of S. Francesco dei Vanchetoni (1603), the Chapel of the Princes in S. Lorenzo (begun in 1604), the Church of SS. Filippo e Giacomo, and the façade of the Ognissanti (1637). The interior of this last, with a single aisle (14th cent.; rebuilt, 17th cent.), is decorated with frescoes by Taddeo Gaddi, Botticelli (II, PL. 328), the Ghirlandajos, and Giovanni da San Giovanni. In the adjoining cloister by Michelozzo are frescoes by Giovanni da San Giovanni, and in the refectory is Ghirlandajo's *Last Supper*. Nigetti rebuilt S. Gaetano (1604–48) as a Latin cross over a previous 11th-century church. Pier Francesco Silvani designed the Palazzo Corsini (1648–56) and part of the Convento dei Filippini, now S. Firenze, which consists of a palace and two churches (PL. 210). The Via Cavour and Via Sto Spirito contain a number of private palaces of the 17th and 18th centuries. The most noteworthy example of baroque decoration is the Niccolini Chapel in Sta Croce, designed by Giovanni Antonio Dosio, with an oval dome decorated with frescoes by Volterrano, who also painted the dome of the SS. Annunziata. Baroque frescoes in the Palazzo Pitti are by F. Furini, Giovanni da San Giovanni, Pietro da Cortona, and Ciro Ferri. The frescoes in the gallery of the Palazzo Medici-Riccardi (PL. 224) and the dome of the Corsini Chapel in S. Maria del Carmine (1682–83) are by Luca Giordano. In neoclassic style are the Arch of Triumph (late 18th cent.), the Palazzo Borghese, the lobby of the Teatro della Pergola (by Gaetano Baccani, 1826), and the Villa di Poggio Imperiale, designed by Gaspare Maria Paoletti and Pasquale Poccianti.

In the 19th and early 20th centuries the façades of the Cathedral and Sta Croce were remodeled in Neo-Gothic style and the castle of Vincigliata and the Torre del Gallo were adapted in Neo-Romanesque.

Notable structures of the 20th century include the stadium by Pier Luigi Nervi (1932), the central station (1935) by G. Michelucci and others, the Vespucci bridge (1955–57) by R. Morandi, E. and G. Gori, and E. Nelli, and the Cassa di Risparmio (1957–58) by G. Michelucci.

Museums and Galleries: Uffizi Gallery (paintings) and Gabinetto dei Disegni e Stampe (drawings and prints), in the Palazzo degli Uffizi; Galleria Palatina, Museo degli Argenti, and Galleria di Arte Moderna, in the Palazzo Pitti; Museo dell'Opera del Duomo (with many of the original sculptures from the Campanile and the Cathedral); Museo di S. Marco, in the monastery of S. Marco (with works of Fra Angelico); Galleria dell'Accademia (Florentine paintings and sculptures by Michelangelo); Museo Archeologico (Egyptian, Greek, Roman, and Etruscan art); Museo Nazionale, in the Bargello (Tuscan sculpture, 14th–17th cent., and minor arts); Museo dell'Opera di Sta Croce; Fondazione Horne (paintings, drawings, decorative arts, and furniture); Belvedere fortress (exhibition of detached frescoes); Casa Buonarroti (works by Michelangelo); Galleria dell'Ospedale degli Innocenti; Museo Preistorico and Museo Storico e Topografico, in the former convent of the Oblates; Palazzo Vecchio (the Loeser Collection of Tuscan painting and sculpture); Galleria Corsini; Galleria Ferroni; Museo Mediceo, in the Palazzo Medici-Riccardi; Museo del Bigallo; museum of the Opificio delle Pietre Dure (workshop of semiprecious stones); Museo Bardini (paintings, sculpture, and minor arts); Fondazione Salvatore Romano, in the refectory of Sto Spirito; Museo Stibbert (paintings, minor arts, armor and weapons); Museo dell'Antica Casa Fiorentina, in the Palazzo Davanzati; Biblioteca Laurenziana (permanent exhibition of codexes, illuminated missals and choir books, incunabula); Museo Nazionale dell'Artigianato (applied and folk art); Museo Duprè.

Environs: Badia di S. Salvatore a Settimo, with its church (SS. Salvatore e Lorenzo), existed in the 10th century, was rebuilt in the 13th by the Cistercian Order, and was later remodeled. The church has a nave and two side aisles, a trussed wooden ceiling, and a rose window. The apses are Renaissance. There are noteworthy remains of the Cistercian monastery, including the chapter house. The Certosa of Galluzzo (founded 14th cent.) includes the church, remodeled in succeeding centuries, containing works by 14th–18th-century Florentine artists. The monastery contains frescoes by Bronzino and Pontormo. The priest's house at Sant'Angelo a Vico l'Abate contains the *Madonna Enthroned* by Ambrogio Lorenzetti (1319). The parish church, San Pietro a Ripoli, has existed since the 8th century but has been completely rebuilt. The Church of S. Maria at Impruneta has two chapels decorated by Luca della Robbia. In the surrounding countryside are many Renaissance villas and older houses transformed by Renaissance architects; among them are the Medici villa at Careggi, originally a battlemented castle, enlarged and turned into a country villa by Michelozzo (ca. 1443), later decorated by Pontormo and Bronzino; Poggio a Caiano, rebuilt by Giuliano da Sangallo, restored and enlarged (16th cent.), with frescoes by Andrea del Sarto, Pontormo, and Alessandro Allori; the Villa Demidoff at Pratolino, rebuilt by Buontalenti (1569–81); Villa di Gamberaia; Il Riposo (Villa Signorini), with works by Giambologna; the Medici villa at Castello (remodeled 15th and 16th cent.), with gardens laid out by Tribolo and decorated with statues by him, Ammanati, and Giambologna; I Tatti, at Settignano, with the Berenson Collection (now property of Harvard University).

Grosseto. The town grew up around a 9th-century castle, after the destruction of the ancient town of Roselle by the Saracens in 935. Its most remarkable features are the city walls, on a hexagonal plan with six powerful bastions (1574–90), following the circuit of the 12th-century walls built by the Aldobrandeschi and incorporating the Rocca, a Sienese fortress (ca. 1330). In the 19th century the bastions and ramparts were turned into avenues with trees and public gardens. The Cathedral, originally Romanesque (12th and 13th cent.), was rebuilt (1294–1302) by Sozzo di Rustichino of Siena in Gothic form and has been restored a number of times. The façade was rebuilt in Neo-Romanesque style (1840–45). S. Francesco (13th cent.) is in Franciscan Gothic style. The Palazzo Comunale (1870) is in neoclassic style. The Palazzo della Provincia, in Neo-Gothic style, is of the 20th century. *Museums*: Museo Diocesano d'Arte Sacra (paintings and religious art by Sienese artists); Museo Archeologico (Etruscan and Roman antiquities).

Approximately 2½ miles north-east of Grosseto are the remains of the Etruscan city of Roselle (Rusellae), which became subject to Rome in 294 B.C., and was a *civitas foederata* until the 1st century B.C. In the Middle Ages it was the see of a bishop, from the 5th century until 1138. The ancient walls, of polygonal masonry are still standing. Part of the zone of the forum, an amphitheater (1st cent. B.C.) and a necropolis, with graves from the 8th century B.C. to the Roman period have been discovered.

Leghorn (It., Livorno). A modern port city, Leghorn probably first developed as a fortified spot. In the 12th century there was a castle on the site, belonging at various times to Pisa, Genoa, the Angevins, Florence, and Lucca. In 1421 it was ceded by Genoa to Florence. The Medici strengthened the fortifications and built an arsenal in the 16th century. Cosimo I connected the port with Pisa by a canal and built the customs house and a fortress at Antignano. Bernardo Buontalenti directed the enlargement of the harbor in 1571. Ferdinand I raised Leghorn to the rank of a city in 1605, declared it a free port, and promoted the construction of the Cathedral. The canal quarters of Venezia Nuova and S. Marco were laid out by Ferdinand II. Because of the numerous destructions and the continual growth of the city, few monuments have survived, and its appearance is almost entirely modern. The Fortezza Vecchia was built (1521–30) by Antonio da Sangallo the Younger and the Fortezza Nuova, designed by Giovanni de' Medici, Bernardo Buontalenti, and Vincenzo Bonanni, was begun in 1590. The two were once united by a curtain wall. Many of the 17th-century buildings have been destroyed or rebuilt, among them, the Church of the SS. Annunziata, by Alessandro Pieroni (1601); the Consolazione, also by Pieroni (1599), containing works by Matteo Rosselli and Volterrano; and the Cathedral, designed by Buontalenti and completed by Pieroni. The monument to Ferdinand I (erected 1607; also known as the "Quattro Mori") incorporates figures by Giovanni Bandini (1595) and Pietro Tacca (added 1624). S. Ferdinando (Chiesa della Crocetta) was built in 1707–14, from designs by Giovanni Battista Foggini. The Cisternino (formerly a filtering plant, now a concert and exhibition hall) and the Cisternone, a reservoir, were built (1829–42) by Pasquale Poccianti. The neoclassic Palazzo De Larderel was built in 1832 and enlarged by Ferdinando Manganini in 1850. The Piazza della Repubblica ("del Voltone") contains two gigantic statues of Ferdinand III and Leopold II. The Città Ospedale was built in 1931, from plans by Ghino Venturi. The Accademia Navale (1881) was designed by Angelo Badaloni. The Museo Civico Giovanni Fattori (in the Villa Fabbricotti) contains prehistoric, Etruscan, and Roman material, and paintings by Giovanni Fattori and others.

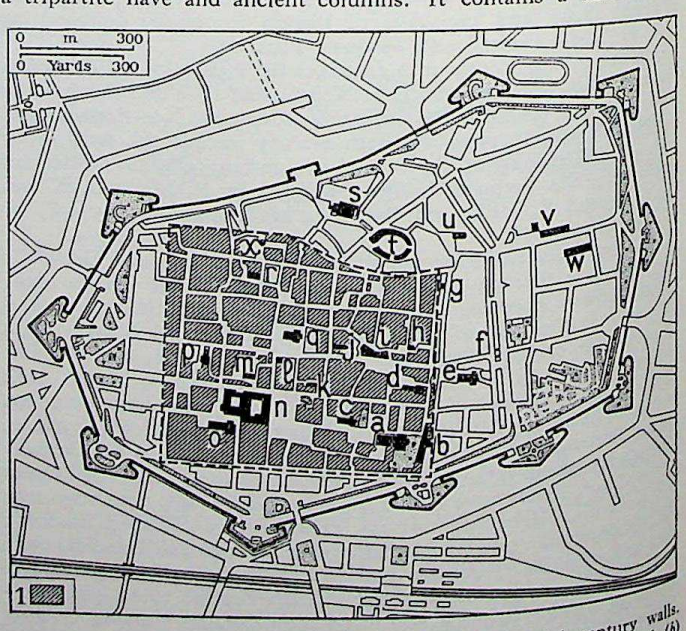
Lucca (Lat., Luca). A Latin colony, founded in 180 B.C. in the Garfagnana. The Roman city was almost a perfect rectangle, with the streets laid out on a checkerboard pattern. There are remains of an amphitheater. The prosperity of the Middle Ages from the 11th to the 13th century left an imprint on the city which has remained more or less unaltered. The Pisan Romanesque was interpreted by the Luccan architects with a greater emphasis on the decorative element. A good example is the Cathedral (S. Martino), begun in 1060. The plan is a Latin cross. The façade has three orders of small arcades above a portico; the upper part, by Guidetto da Como (1204), has inlaid decorations of white and black marble. The campanile was completed in the 13th century (PL. 178). The three portals are decorated with reliefs by Lombard artists and a lunette by Nicola Pisano (X, PL. 326). The interior, remodeled in Gothic style in the 14th and 15th centuries, contains the original sculpture of St. Martin and the beggar (copy on the façade; PL. 181); the Tempietto del Volto Santo (1482–84) with a Crucifix (IV, PL. 210) mentioned by Dante (*Inferno* XXI, 48); the tomb of Ilaria del Carretto, by Jacopo della Quercia (IV, PL. 148); and works by Fra Bartolommeo, Giambologna, Domenico Ghirlandajo, Matteo Civitali, and Cosimo Rosselli. S. Frediano (1112–47) has a façade divided into three sections by pilaster strips, with a small loggia and architrave over the central section, and a mosaic of the Ascension in Italo-Byzantine style. The interior is a basilica with a tripartite nave and ancient columns. It contains a 12th-century



Lucca, plan, with expansion within and without the 16th-century walls. *Key*: (1) Area of the Roman city. Principal monuments: (*a*) Cathedral; (*b*) Palazzo dell'Arcivescovado and the Oratory of S. Maria della Rosa; (*c*) S. Giovanni; (*d*) S. Maria dei Servi; (*e*) S. Maria Forisportam; (*f*) Porta dei SS. Gervasio e Protasio; (*g*) SS. Simone e Giuda; (*h*) S. baptismal basin (reassembled, 1950), a baptismal font by Matteo Civitali (1489), a carved altar, tombs of the Trenta family by Jacopo della Quercia (IV, PL. 151), sculptures by Andrea della Robbia, and frescoes by Amico Aspertini. S. Michele in Foro (1143) was enlarged a number of times. It is in the form of a Latin cross. The 13th-century façade (restored, 19th cent.) has a series of blind arches surmounted by four orders of small loggias. The interior contains a *Crucifixion* by a 13th-century Luccan painter, a *Madonna and Child* by Andrea della Robbia, and *SS. Jerome, Sebastian, Rocco, and Helena* by Filippino Lippi. S. Giusto (12th cent.) is in a simple version of the local Pisan Romanesque style. S. Alessandro (12th cent.) has a sober white-and-gray striped marble façade; the marble decorations of the apse are of the 13th century. S. Maria Forisportam (13th cent.) is designed on strictly Pisan Romanesque lines; in the interior are a baptismal font made from an Early Christian sarcophagus, and paintings by Guercino. S. Pietro Somaldi (12th cent.) has a 13th-century two-color façade. The Chiesa del Salvatore (12th cent., remodeled in Gothic style) has sculpture by Biduinus (12th cent.). The Gothic style, noted above in the remodeling of certain churches, is found in few buildings, which are inferior in quality and wealth of decoration to their Romanesque predecessors. Among them are the Oratory of S. Maria della Rosa (1309, later enlarged); S. Romano (rebuilt, 1280; enlarged, 1373 and 17th cent.) with the tomb of St. Romanus by Matteo Civitali and a *Circumcision* by Rutilio Manetti; S. Maria dei Servi (14th cent., remodeled several times), with marble tabernacles by Nicolao Civitali and paintings by Matteo Rosselli; S. Francesco (founded, 1228; repeatedly rebuilt), with a Gothic portal on the façade and works by Deodato Orlandi, Il Passignano (Domenico Crespi), and Federico Zuccari; the former Oratory of S. Franceschetto (1309); S. Andrea (13th cent.); and S. Anastasio (12th–14th cent.). There are several noteworthy houses of this period, such as the Guinigi houses, with great archivolts enclosing triple and quadruple arched windows. On the Via Fillungo and Via Santa Croce there are several 13th- and 14th-century houses. Other Gothic structures include the Loggia dei Guinigi and the Villa of Paolo Guinigi.

In the Renaissance period the Palazzo Pretorio was begun (1492); the design is attributed to Matteo Civitali, but it was continued by his son Nicolao and enlarged in 1588 by Vincenzo Civitali. The 16th-century Palazzo Bernardini and Palazzo Cenami are both attributed to Nicolao Civitali. S. Paolino, begun in 1522 by Baccio da Montelupo and completed in 1539 by Bastiano Bertolani, has a high Renaissance façade with three orders of pilasters, single aisle, and transept with lateral chapels. The Church of SS. Trinità (1589) contains the *Madonna della Tosse* by Matteo Civitali. The Palazzo Bernardi (now Micheletti) was designed by Bartolommeo Ammanati (1556), as was also the Palazzo della Signoria (now della Prefettura; begun 1578), which was finished in 1728 by Francesco Pini on plans after Filippo Juvara and Ammanati. The Palazzo Buonvisi (Bottini), also known as Palazzo del Giardino, was built in 1566. The city walls, built between 1504 and 1645, with diamond-shaped bulwarks and a platform, have been turned into a promenade planted with trees. *Museums*: Pinacoteca Nazionale di Palazzo Ducale; Museo Nazionale di Villa Guinigi.

Massa and Carrara. These two neighboring cities form a single administrative unit as a provincial capital. Massa, in the foothills of the Apuan Alps, was in existence at least in 882. Its growth was contemporary with the decline of the ancient city of Luni (now a ruin). The first fortified nucleus (Massa Vecchia) was built (11th cent.) by the Obertenghi family; in 1442 the Malaspinas built a castle surrounded by walls. The lower town, Massa Nuova, dates from 1557 and is dominated by the Palazzo Cybo-Malaspina (begun 16th cent., enlarged by Gian Francesco Bergamini in 1665, completed by Alessandro Bergamini, who designed the façade, in 1701). The Cathedral, founded in the 15th century, was later remodeled in neoclassic style; the façade is modern.

Carrara has been famous for its marble quarries from ancient times. Mentioned in a document of 963, it was disputed territory during the Middle Ages until it came into possession of Giacomo Malaspina of Massa, in 1473, after which its history parallels that of Massa. The Cathedral (11th–14th cent.) is of Pisan Romanesque type with Gothic elements. The Palazzo Cybo-Malaspina, attached to the 13th-century fortress, was built in the 16th century but has been radically restored. It houses the Accademia di Belle Arti. Also of the 16th century is the Church of the Carmine. S. Francesco and S. Maria delle Grazie are of the baroque period, and the Chiesa del Suffragio, of the early 19th century.

Nearby is the town of Pietrasanta, medieval in plan, with buildings concentrated around the main square. The Cathedral (founded, 1330; restored, 17th and 19th cent.) has a rose window and a tripartite façade with 14th-century sculptured portals. The Baptistery, of 1608, was restored in the 18th century. S. Agostino, of the 14th century, has three blind arches, above which is a Gothic loggia (1431).

Massa Marittima. Known to have belonged to the Etruscans and later to the Romans, its history is linked with that of Populonia (see below). It was destroyed by the Saracens in 935, but in the later Middle Ages it became prosperous. It declined after the 16th century on account of malaria, but in the 19th century reclamation brought a return of prosperity. It is divided into a lower (older) city and an upper (newer) city and is surrounded by walls, partially destroyed in 1337, rebuilt and enlarged at a later date. The layout of the streets is irregular, except in the newer quarters. The Cathedral (13th–14th cent.) was originally Romanesque with Pisan influences; the later parts have Gothic elements, especially in the presbytery and apse; the campanile has been rebuilt. The interior has three aisles, with richly carved capitals, and contains a baptismal font carved by Giroldo da Lugano (1267), the tomb of St. Cerbonius, by Goro di Gregorio of Siena (1324), and an altarpiece *Madonna delle Grazie* (derived from Duccio's *Maestà*). The upper city contains a number of Romanesque secular buildings, including the house of the Biserno family (13th cent., with Renaissance additions), with a crenelated tower; the Palazzo Comunale (central part by Stefano di Meo and Gualtiero di Sozzo, 14th cent.) with its tower (Bargello) built in the 13th century; and the Torre del Candeliere (or Orologio), part of a fortress built in 1228, adjoining the 14th-century Porta alle Silici. The Sienese fortress, built after the conquest of the city in 1337, was later partly demolished and rebuilt. S. Agostino, built 1299–1312, is Gothic, with a monumental portal and a rose window on the façade and a polygonal apse. S. Francesco (13th cent.), Romanesque Gothic, retains the original polygonal apse but is much damaged. The Museo Civico, in the Palazzo Comunale, contains the *Maestà* by Ambrogio Lorenzetti.

BIBLIOG. L. Petrocci and E. Lombardi, Guida storico-artistica di Massa Marittima, Massa Marittima, 1957; P. Bocci, EAA, s.v. Massa Marittima, IV, 1961, pp. 918–19.

Montalcino. Situated on a hill between the valleys of the Ombrone and the Asso, the site was inhabited in Etruscan and Roman times. In 814 it was donated to the Abbey of S. Antimo but later became an independent commune. The Palazzo Comunale, with a high tower, was built in the 13th and 14th centuries under the commune in Florentine style. The Loggia (14th–15th cent.) is nearby. The Rocca, a Sienese fortress built in 1361 during the war between Siena and Florence, incorporates walls of the 13th century and has bastions added in the 16th century. S. Egidio was built by the Sienese in 1325 on the site of an older church. S. Francesco is of the 13th century (remodeled, 18th cent.). The Cathedral, originally Romanesque, was rebuilt in neoclassic style (1818–32). *Museums*: Museo Civico, with Sienese art, local archaeological material, and ceramics; Museo Diocesano di Arte Sacra.

A few miles south is the Abbey of S. Antimo, founded in the early 9th century as a Benedictine congregation. The church (1118) is Romanesque of French influence, with nave and side aisles, an ambulatory, radiating chapels in the apse, and gallery. The crypt is part of the original 9th-century building. The campanile, of Lombard type, is of the 13th century.

Montepulciano. The site was probably inhabited by the Etruscans. It was mentioned as Mons Politianus in a document of 715. It was nearly always subject either to Florence or Siena, being independent only between 1208 and 1260. In appearance the city is mostly of the Renaissance. Surviving medieval buildings were originally Gothic but are mostly remodeled. S. Agnese (built, 1311; remodeled in the 17th cent.; façade, 1926) preserves a 14th-century portal and frescoes of the Sienese school. S. Maria dei Servi (14th cent.) has a Gothic façade with a cusped portal; the baroque interior, decorated with frescoes, was designed by Pier Andrea Pozzo. The Casa del Poliziano, the Palazzo Comunale (with double battlemented tower), and the Palazzo del Capitano del Popolo (now della Pretura), are all of the 14th century but partly remodeled. The Palazzo Neri-Orselli Bombagli is in Sienese Gothic style (restored). The Renaissance buildings and monuments show Florentine influences. S. Agostino, in transitional Gothic-Renaissance style, has a late Gothic façade completed and decorated by Michelozzo (PL. 191); the single-aisled interior, remodeled in the 18th century, contains works by Pollaiuolo, Lorenzo di Credi, and Giovanni di Paolo. The Cathedral (1592–1630) was designed by Ippolito Scalza; in the interior are parts of the dismantled tomb monument of Bartolomeo Aragazzi, by Michelozzo (III, PL. 391), and a triptych of the *Assumption* by Taddeo di Bartolo. A number of palaces are attributed to Vignola, including the Avignonesi, Tarugi (formerly Nobili), and Grugni (formerly Gagnoni). The Palazzo Contucci (fomerly Del Monte) was designed by Antonio da Sangallo the Elder in 1519 but was completed by Baldassare Peruzzi; frescoes in the interior are by Pier Andrea Pozzo. Peruzzi also designed the Palazzo Ricci. The Palazzo Cervini, designed by Antonio da Sangallo the Elder, was never completed. Also attributed to Antonio da Sangallo the Elder is the Cocconi palace. The Logge del Mercato, with a triple arcade supported by piers, are attributed to Ippolito Scalza. Of the baroque period is the Gesù (begun 17th cent.), on a circular plan, by Giovanni Battista Arrigoni, remodeled by Pozzo, and completed (1733) by Sebastiano Cipriani. Pozzo also designed the oval Church of S. Bernardo. S. Lucia has a baroque façade by Flaminio del Turco (1653); the interior (restored) contains the *Madonna della Misericordia* by Luca Signorelli. The Museo Civico, in the Palazzo Comunale, contains 14th–17th-century Tuscan paintings and minor arts.

Beyond the Porta al Prato is the Church of the Madonna di S. Biagio, the masterpiece of Antonio da Sangallo the Elder (1518–45), in the form of a Greek cross with a dome over the crossing and a projecting semicircular apse. To the left of the church is the Canonica, designed by Sangallo the Elder (1595), with two orders of loggias. Also outside the city is the Church of S. Maria delle Grazie, designed by Ippolito Scalza.

Orbetello. On a narrow strip of land projecting into the Orbetello lagoon, it was a flourishing Etruscan city between the 8th and 4th centuries B.C. Under Rome it declined, its place being taken by Cosa. In the Middle Ages it belonged successively to the Abbey of Tre Fontane, the Aldobrandeschi and Orsini families, and, from 1414 to 1555, to Siena. From 1555 to 1708 it was the capital of the Spanish presidio, which included Porto Ercole, Porto Santo Stefano, the Monte Argentario peninsula, Talamone, and Porto Longone (on Elba). In 1736 it became a part of the Kingdom of Naples, and in 1815 it was annexed by the grand duchy of Tuscany. Of the Etruscan period are parts of the polygonal walls, with double piling (3d cent. B.C.). There are traces of a Roman temple of the republican period. The Cathedral (founded 1376) was enlarged in the 17th century; it retains the original Gothic façade. There are remains of the Spanish fortifications of 1557–1620. The Antiquarium Comunale contains Etruscan, Greek, and Roman antiquities found in the neighborhood.

Pescia. In the Valdinievole, between Pistoia and Lucca, this was an independent commune from the 12th century until it came under Florentine rule in 1329. The Palazzo Vicario (now the Municipio) dates from the 13th century. S. Francesco's (late 13th cent.; façade remodeled, 1505 and 1632) interior (restored) is notable for the Cardini Chapel attributed to Andrea Cavalcanti (Il Buggiano), a pupil of Brunelleschi; for a panel portraying St. Francis by Bonaventura Berlinghieri (1235); and for works by Neri di Bicci and Niccolò di Pietro Gerini. S. Antonio (1361) is decorated with frescoes by Bicci di Lorenzo and contains a 13th-century *Deposition* in wood. The Oratory of the Madonna a Piè di Piazza (SS. Pietro e Paolo), built in 1447, is attributed to Il Buggiano. The Cathedral, rebuilt in 1693 by Antonio Ferri, incorporates some Romanesque fragments from the earlier church. The campanile was built in 1306. The Museo Civico and the Biblioteca Comunale, with an important collection of incunabula and manuscripts, are in the Palazzo Galeotti.

Approximately 5 miles west of Pescia is Collodi with the Villa Garzoni, situated in an Italian garden laid out by Ottaviano Diodati (18th cent.). In the town is a monument to Pinocchio by Emilio Greco (1954).

Pienza. The town is named after Pope Pius II (Aeneas Silvius Piccolomini), who sponsored its construction on the site of the medieval village of Corsignano and commissioned Bernardo Rossellino to plan it. Begun in 1459, it has retained the Renaissance unity of style, centered around a square of monumental character (I, PL. 390). The Cathedral (1459–62; III, PL. 388) was designed by Rossellino, on the *Hallenkirche* plan, with a nave and two lateral aisles terminating in a circular ambulatory. The church contains works by Sano di Pietro, Lorenzo di Pietro (Il Vecchietta), and Matteo di Giovanni. The Palazzo Piccolomini, which derives from Alberti's Palazzo Rucellai in Florence, is also by Rossellino, to whom the Palazzo Comunale is attributed as well. The former Palazzo Borgia (now Vescovile) was remodeled from a Gothic structure, probably by Il Vecchietta. Also of the 15th century are the Palazzo Ammannati (now Newton) and the Palazzo Simonelli (formerly Gonzaga). A few of the buildings of the older town of Corsignano still exist. S. Francesco (13th cent., restored) has a single aisle with a trussed ceiling. The old parish church, outside the city, is Romanesque of the 11th and 12th centuries, with small unsupported arches crowning the façade. The Museo Diocesano di Arte Sacra has a collection of material from the Cathedral and other churches.

Pisa (Lat., Pisae). Originally, a port, Pisa now is situated on both banks of the Arno, about 6 miles from the estuary. It may have been a Greek Phocian colony (founded, 7th–6th cent. B.C.) on Ligurian territory or a Ligurian city conquered by the Etruscans in the 5th century B.C. Under the Romans it was an important naval base, and its maritime activity continued in the early Middle Ages. As a free commune and a maritime republic (11th–14th cent.), Pisa flourished, and the major architectural monuments and city plan of the present are of those centuries, though heavily damaged in World War II. Of the Roman period there are remains of baths (the so-called "*Bagno di Nerone*"), of the 2d century, and traces of the forum and of an amphitheater.

Pisan Romanesque architecture, seen at its finest in the Piazza dei Miracoli (Piazza del Duomo), is expressed in forms of great originality which had an influence far beyond the borders of Tuscany (see *Apulia, Sardinia*). The Cathedral, begun in 1063 by Busketus, was enlarged (1150–60) by Rainaldo, who lengthened the nave and erected the façade with an order of arches on the ground level and four orders of loggias above. The lateral walls have a series of blind arches. The bronze doors of the Porta di S. Ranieri (IX, PL. 508) are by Bonannus of Pisa. The interior is a Latin cross, with a nave and four aisles and a semicircular apse. The arms of the transept also have semicircular apses. The conch of the central apse is decorated with 13th-century mosaics completed by Cimabue (III, PL. 327). The dome above the crossing rests on an ellipsoid drum above pointed arches of Islamic type. The pulpit is by Giovanni Pisano (VI, PLS. 213, 214; X, PL. 248). The church also contains canvases by Domenico Beccafumi and a series of paintings by Tuscan and mannerist painters of the

16th and 17th centuries (among them, Andrea del Sarto; I, PL. 252). The freestanding Campanile (the famous "Leaning Tower") was begun in 1174 by Bonannus and completed in 1372. It is cylindrical, and the decoration repeats that of the façade of the Cathedral, with open loggias above an order of high blind arches on the ground level. The Baptistery, begun in 1153 by Diotisalvi, is circular in plan, faced with blind arcades, and surmounted by a dome. The crowning and decorations are Gothic. The cusps of the loggia of the second level are decorated with half figures by Nicola and Giovanni Pisano and assistants (some are copies). The interior has a gallery supported by eight pillars and four piers, creating a circular ambulatory. The octagonal baptismal font is by Guido Bigarelli da Como (VIII, PL. 82). The hexagonal pulpit, by Nicola Pisano (I, PL. 303; X, PL. 321) is supported by seven columns. The Piazza dei Miracoli is completed by the Camposanto. Designed by Giovanni di Simone in 1278, the plan is a rectangular enclosure, with an outer marble wall decorated with blind arches, and the inner space surrounded by a porticoed gallery. It contains sculptures of various periods and a cycle of 14th- and 15th-century frescoes, among them, *The Triumph of Death* (IV, PL. 466; VI, PL. 379) and works by Antonio Veneziano, Spinello Aretino, Benozzo Gozzoli, and Taddeo Gaddi, all badly damaged in 1944 and heavily restored. S. Paolo a Ripa d'Arno (PL. 178), built over a 9th-century church, was reconsecrated in 1148. The façade has arches of various types, some of Oriental derivation and some with twisted columns. Directly behind the church is the octagonal Chapel of S. Agata (12th cent.), which shows Lombard influences. Most of the other Romanesque churches have been restored or remodeled, including S. Pierino (1072–1119), with a vast crypt; S. Frediano (11th–12th cent.; restored, 16th–17th cent.); S. Matteo (11th–13th cent.; remodeled, 17th cent.); S. Jacopo in Orticaia, with 12th-century exterior (interior remodeled, 17th cent.); S. Cecilia (1103), with a simple Romanesque façade decorated with majolica plaques; and S. Andrea Forisportam (12th cent.; remodeled, 1840).

The earliest Gothic influences appeared in the second half of the 13th century. The Dominican Church of S. Caterina, built between 1251 and 1300, has a traditional Pisan façade (1330), but the arches of the two upper orders of arcades are Gothic. The interior contains works by Nino Pisano (VI, PL. 366), Francesco Traini, Fra Bartolommeo, Santi di Tito, and others. The campanile of the Benedictine Church of S. Nicola (mid-13th cent.) is cylindrical in the lower part, octagonal above, and surmounted by a loggia. The church was completely remodeled at a later period. S. Francesco was founded in 1211 but rebuilt in its present form in the 14th century; the façade was completed in 1603. It contains frescoes by Taddeo Gaddi (1342), Niccolò di Pietro Gerini (1392), and Taddeo di Bartolo (1397). S. Maria della Spina (VI, PL. 337) was originally a small oratory on the banks of the Arno; it was enlarged in 1323, and in 1871 it was dismantled and reassembled, on a higher level, on the Lungarno. The façade and right side are decorated in an elaborated Gothic style, with statues by pupils of Giovanni and Nino Pisano. Of the late 14th century, but all remodeled to a greater or lesser extent, are S. Domenico, with frescoes by Benozzo Gozzoli; S. Maria del Carmine, rebuilt in 1612; S. Giorgio ai Tedeschi, with a 14th-century Rhenish wooden crucifix; S. Ranierino, with frescoes by Spinello Aretino and a *Crucifixion* in Byzantine style by Giunta Pisano; S. Martino; and S. Antonio.

Medieval secular architecture is represented by a number of house towers and a few palaces, including the Palazzo Medici (now the Prefettura), recently restored; the Palazzo Gambacorti (now Palazzo Comunale), with a 17th-century lateral façade; and the Scorzi and Agostini palaces. There are few important buildings or monuments of the 15th century: The Fortress (restored) was originally a Pisan arsenal (12th cent.?) and was rebuilt by the Florentines in 1405; the Ospizio dei Trovatelli (Foundling Hospital) is in Florentine style. The Piazza dei Cavalieri, laid out in the 16th century by Giorgio Vasari, is dominated by the Palazzo dei Cavalieri, rebuilt by Vasari in 1562. Adjoining it is the Church of S. Stefano dei Cavalieri (also by Vasari, 1565–69); the interior, with a single aisle, has a 17th-century carved wooden ceiling and contains the so-called "S. Rossore" (a reliquary figure) by Donatello, a *Nativity* by Bronzino, and works by late mannerist Florentine artists. The Palazzo dell'Orologio (now Gherardesca), the Palazzo del Collegio Puteano, and the Palazzo del Consiglio dell'Ordine dei Cavalieri di S. Stefano complete the square. Other late 16th- and 17th-century buildings include the Palazzo Upezzinghi (also known as *alla Giornata*), by Cosimo Pugliani (1594); the Palazzo Reale, by Baccio Bandinelli (1559); the episcopal palace; and the Palazzo Simoneschi. The Logge di Banchi, an arcade built in 1603–05 as a textile market, are attributed to Buontalenti. The Museo Nazionale contains an important collection of Tuscan painting and sculpture from the 12th to the 15th century, including works by Giovanni Pisano, Simone Martini, Donatello, Jacopo della Quercia, Verrocchio, Fra Angelico, and Masaccio.

Outside the city, between Pisa and the sea, is the Romanesque Church of S. Pietro a Grado (mid-11th cent.), built over a 6th–7th-century church, at the point where, in Roman times, the Arno flowed into the Pisan bay. It has no façade, but the exterior is decorated with pilaster strips, unsupported arches, and glazed terra-cotta medallions. It has a triple apse at the eastern end and a single apse at the western end. The interior is divided into a nave and two aisles by ancient columns and preserves 13th-century frescoes.

Pistoia (Lat., Pistoriae). Of Roman origin (3d or 2d century B.C.), Pistoia became an episcopal see in the 5th century and under the Lombards was an imperial city. In 1115 it became an independent commune. Periods of prosperity alternated with wars against Lucca and Florence, until in 1530 Pistoia became subject to the latter. In World War II it suffered heavy damage. From the Roman period the city still retains traces of the rectangular plan, growing up around a central square within the bastions. The local Romanesque architecture is derived from Pisan models, with an added emphasis on delicacy of pattern and on the use of color. The Cathedral, founded in the 5th century, has retained Romanesque elements in the façade and in the interior (partly remodeled, 17th cent.). It contains the silver altar frontal of St. James (VI, PL. 388), the monument of Cardinal Forteguerri, in part by Verrocchio, and the *Madonna and Child Enthroned with Saints*, begun by Verrocchio and completed by Lorenzo di Credi (1485). In the sacristy (Museo della Cattedrale) there are a storied cross by Coppo di Marcovaldo and his son, and a rich treasury. Several churches have retained their original Romanesque structure intact. S. Bartolomeo in Pantano (1159) has a façade with five arches and central portal, with sculptured architrave attributed to Gruamonte (1167). The interior is divided into three very narrow aisles and contains a pulpit by Guido Bigarelli da Como (III, PL. 19). S. Andrea (12th cent.) is of similar design; the sculptures above the central portal are by Gruamonte and Adeodatus (1166); the pulpit in the interior is by Giovanni Pisano (III, PL. 312; VI, PL. 212). S. Giovanni Fuorcivitas, built between the 12th and 14th centuries, has an unfinished façade; its lateral walls are decorated with white and green marble stripes and blind arches enclosing geometric designs (PL. 178). The architrave of the lateral portal is by Gruamonte (1162). In the interior, which has a single aisle and a raised presbytery, are a pulpit by Fra Guglielmo (1270), a holy-water stoup by Giovanni Pisano, and a polyptych by Taddeo Gaddi (1355).

Gothic elements are seen in the Baptistery, finished by Cellino di Nese (1359) from designs by Andrea Pisano. It is octagonal, with wall facings of white and green marble, showing Florentine influence. S. Domenico, probably designed by Fra Sisto and Fra Ristoro in the late 13th century, enlarged in 1380, is Gothic, with a rectangular apse. The interior has a wide nave with a trussed ceiling and Gothic vaulting in the transept; it preserves 14th-century frescoes, the tomb of Filippo Lazzari by Bernardo and Antonio Rossellino (1462–68), and a *Madonna and Child* by Fra Bartolommeo. S. Francesco, begun in 1294 (façade 1717), is Latin cross in plan, with a single aisle and a trussed ceiling. The apse is flanked by the five groin-vaulted chapels of the transept. The walls are decorated with 14th- and 15th-century frescoes by the school of Giotto and Sienese artists.

Secular buildings of the period include the Palazzo del Comune (begun 1294; enlarged several times), with a portico and two orders of double- and triple-arched windows above; the Palazzo Pretorio (1367; with a wing added, 1844–46); the Palazzo Panciatichi (1313–22); and the Palagetto (late 13th cent.), with ancient shops.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Renaissance buildings show a strong Florentine influence. S. Maria delle Grazie was designed by Michelozzo in 1452–69 and was restored in 1896. S. Giovanni Battista, built by Ventura Vitoni (1487–1516), has been reconstructed since World War II. The form is a rectangle with a hemispherical dome on squinches over a rectangular drum. The façade was never completed. The Church of the Madonna dell'Umiltà by Vitoni (begun 1509) has an unfinished façade with an 18th-century portal. The interior is an octagon, with dome and lantern added by Vasari after 1561. The vestibule has barrel vaulting and a small dome on squinches at the center. The Ospedale del Ceppo (founded, 14th cent.) has a portico in the style of Brunelleschi added in 1514. The enameled terra-cotta frieze is by Giovanni della Robbia and assistants (III, PL. 313). The Church of the Spirito Santo is baroque (consecrated, 1647), with an altar in the style of Bernini, a frontal by Pietro da Cortona, and works by Giovanni da San Giovanni. The Borsa Merci (V, PL. 117) was designed by G. Michelucci (1950). *Museums*: Museo Civico, in the Palazzo Comunale, with works by Tuscan artists; Museo della Cattedrale, in the sacristy of the Cathedral.

Populonia (Etruscan, Fufluna, Pupluna). On a promontory north of Piombino, it was inhabited in the 9th century B.C. (Villanovan civilization) and from the 7th century B.C. was an important Etruscan port and industrial center. In the 3d century B.C. it became a Roman foundry center and in 90 B.C. a municipium. It declined during the Middle Ages. There are remains of the Etruscan walls. At Porto Baratti, on the shore below the site of the ancient city, there is a vast necroplis with tombs of Villanovan and Orientalizing Etruscan types, Etruscan tumuli (7th–6th cent. B.C.) with underground chambers and false vaulting, and aedicula tombs of the 5th and 4th centuries. Tomb furnishings included bronzes, gold jewelry, and pottery, both Etruscan and Greek. On the heights is a medieval fortress with towers. The Museo Etrusco contains artifacts of the Villanovan, Etruscan, and Roman periods from the necroplis and others sites in the vicinity.

Prato. The earliest historical record of the town is dated 998. In the 12th century Prato became an independent commune and in 1351 it came under Florentine domination. Its prosperity, from the 13th century onwards, was based on its wool weaving industry, which flourished in the 14th century with the mercantile expansion of Francesco di Marco Datini. The Romanesque Cathedral was founded in the 9th century, but rebuilding was begun in 1211 by Guidetto da Como, who decorated the façade with blind arches (now covered by the 15th-century façade of white and green marble but still visible from the inside). The portal has a lunette by Andrea della Robbia (1489). On the right corner of the façade is a pulpit by Donatello and Michelozzo (1434–38). The five-story campanile (1340–56) has five orders of double- and triple-arched windows. In the interior, the nave is separated from the aisles by dark-green marble columns. The church was enlarged in the 14th century with the addition of the crossing and transept (with Gothic arches and vaulting) and the five chapels of the presbytery. The frescoes in the choir are by Filippo Lippi (IX, PL. 145). The Cathedral also contains works by Antonio Rossellino, Mino da Fiesole, Benedetto and Giuliano da Maiano, Giovanni Pisano, Agnolo Gaddi, and Andrea di Giusto. S. Fabiano, formerly an abbey church, is also Romanesque but has been radically remodeled and restored. S. Francesco (late 13th cent.; remodeled several times) has a 15th-century façade and a single aisle with a trussed ceiling; inside is the tomb of Gimignano Inghirami, attributed to Bernardo and (possibly) Antonio Rossellino. The adjoining cloister is of the 15th century. The chapter house is decorated with frescoes by Niccolò di Pietro Gerini (ca. 1395). S. Domenico (1283–1322) has an unfinished façade with a marble portal; the interior was remodeled in baroque style. S. Bartolomeo, of the late 14th century, was rebuilt after World War II. S. Niccolò, built in 1322, has a baroque interior.

There are a number of interesting secular buildings. The Castello dell'Imperatore (ca. 1237–45), a castle of a type rare in Tuscany, was built for Frederick II, on the perimeter of the old city walls. Square in plan, it has rectangular towers on the corners and a pentagonal tower in the center of each side. The Palazzo Pretorio was built partly in the 12th century and enlarged in the 14th; the small tower was added in the 16th century. The Palazzo Datini (13th cent.), bequeathed to the poor at the owner's death, has external painted decorations and interior frescoes by Niccolò di Pietro Gerini. It houses extensive commercial archives and cloth samples.

One of the masterpieces of Giuliano da Sangallo, S. Maria delle Carceri, was built between 1484 and 1495 in the form of a Greek cross. The unfinished exterior is faced with colored marble. The structure of the interior is outlined in *pietra serena* and is decorated with friezes and medallions of enameled terra cotta by Andrea della Robbia. S. Vincenzo (1733) is an example of the local baroque style. *Museums*: Galleria Comunale, in the Palazzo Pretorio, with paintings of the Florentine school, 14th–17th century; Museo dell'Opera del Duomo.

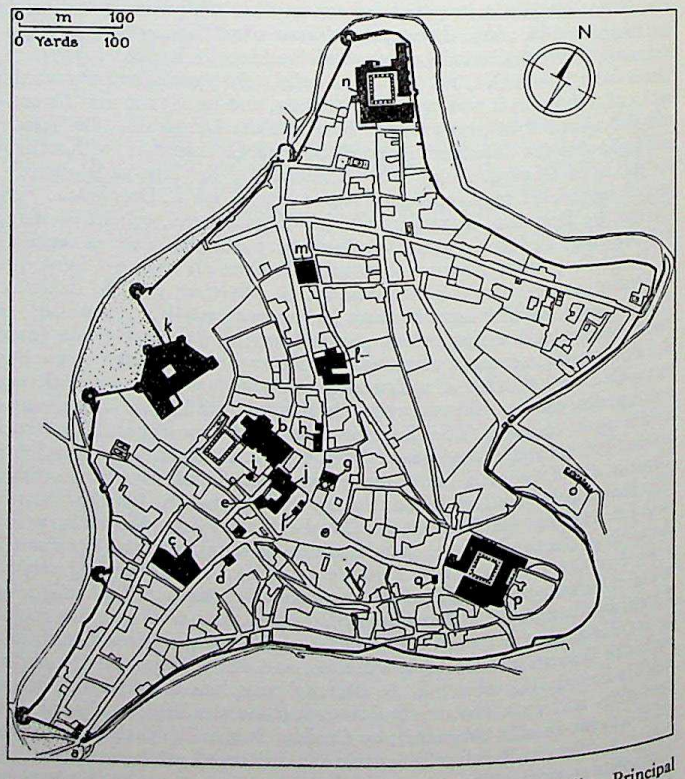
San Gimignano. The site was inhabited in ancient times. The present town was a free commune in the 12th century but was frequently at war with Florence, under whose rule it came in 1354. Enclosed within walls it has retained its medieval appearance. Its most salient characteristic is the large number of towers and the narrow twisting streets. The most noteworthy monuments are Romanesque. S. Pietro (11th cent.) has frescoes by Barna da Siena and other 14th-



San Gimignano, plan of the city within the 13th-century walls. Principal monuments: (*a*) Porta S. Giovanni; (*b*) Collegiata (Cathedral); (*c*) Palazzo Pratellesi; (*d*) Cugnanesi tower; (*e*) Palazzo Becci and tower; (*f*) Ardinghelli tower; (*g*) Palazzo del Podestà; (*h*) Salvucci tower; (*i*) Palazzo della Prepositura; (*j*) Palazzo del Popolo; (*k*) fortress; (*l*) Pesciolini tower-house; (*m*) Palazzo Tinacci; (*n*) S. Agostino; (*o*) fountains; (*p*) penitentiary (formerly Monastery of S. Domenico); (*q*) S. Lorenzo in Ponte (*from G. Rohault de Fleury, La Toscane au Moyen-âge, Paris, 1874*).

century Sienese artists. The Collegiata (Cathedral) was consecrated in 1148; originally basilican, it was remodeled in the form of a Latin cross by Giuliano da Maiano in 1458 and several times thereafter; the façade (1239) has also been remodeled a number of times. The walls and ceiling are frescoed with various cycles, including scenes from the life of Christ by Barna da Siena (1381?), Old Testament scenes by Bartolo di Fredi (ca. 1356), *The Last Judgment* by Taddeo di Bartolo (III, PL. 417), and *The Martyrdom of St. Sebastian* by Benozzo Gozzoli (1465). The church also contains works by Matteo Rosselli, Piero Pollaiuolo, and Jacopo della Quercia. The Chapel of S. Fina, added by Giuliano da Maiano in 1468, contains an altar frontal by Benedetto da Maiano and frescoes of scenes from the life of St. Fina by Domenico Ghirlandajo (VI, PL. 179). The ciborium in the presbytery is also by Benedetto da Maiano. S. Jacopo (founded 13th cent.) has a Romanesque façade, but the interior was remodeled in Gothic style. S. Lorenzo in Ponte (1240, restored) has a Romanesque portal and 15th-century frescoes. Gothic influences are seen in the three apses of S. Agostino (1280–98); the interior contains works by Bartolo di Fredi, Benozzo Gozzoli, Benedetto da Maiano, and Piero Pollaiuolo (XI, PL. 183).

Some of the most interesting architecture is secular. The Palazzo del Podestà (1239; enlarged, 1337) has a tower known as "la Rognosa." The twin towers (13th cent.) of the rival Guelph and Ghibelline families Ardinghelli and Salvucci rise in the center of the town. The Palazzo del Popolo (now Comunale), built in 1288 and enlarged in 1323, is attached to the Torre Grossa (1298); in the council chamber (Sala di Dante) is a fresco copy by Lippo Memmi of Simone Martini's *Maestà*. The Casa-torre Pesciolini (late 13th cent.) is a tower-house of Florentine type. The Via S. Matteo is flanked by some of the best-preserved medieval houses and ends at the Porta S. Matteo (1262), one of the five gates of the city. Palaces of the 14th century include the Tortoli and the Pratellesi. *Museums*: The Pinacoteca in the Palazzo del Popolo, with Sienese and Florentine paintings of the 13th–15th centuries; Museo d'Arte Sacra.

Gimignano et ses enceintes, Mél, LXVII, 1955, pp. 259–77.

S. Quirico d'Orcia (formerly San Quirico in Osenna). Seat of an imperial vicar in the Middle Ages, it came under Sienese rule in 1265. The most noteworthy monument is the Church of the Collegiata (Pieve), known to have existed in the 8th century and rebuilt in Romanesque style in the 12th and 13th centuries (restored after World War II). The Romanesque portal (late 12th cent.) of Lombard type is incorporated into a façade of early Gothic influence. On the right wall is another portal, attributed to Giovanni Pisano (late 13th cent.). A third portal opens into the right side of the crossing. The interior (restored) is a Latin cross and preserves a triptych by Sano di Pietro and wooden choir stalls by Antonio Barili (1482–1502). The little Church of S. Maria (12th cent.) is Romanesque of Lombard influence. It was probably built with the help of master masons from the Abbey of S. Antimo. The Palazzo Chigi, of the 17th century, was damaged in 1944. The Orti Leonini is a large landscaped park, designed by Diomede Leoni, partly enclosed by the walls of the town.

BIBLIOG. A. Canestrelli, La pieve di S. Quirico, Siena, 1906; A. Liberati, San Quirico d'Orcia, B. senese di storia patria, N.S., VII, 1936, pp. 64–68.

Sansepolcro. The town grew up around the original oratory founded in the 10th century by two pilgrims who returned from the Holy Land bearing relics from the Holy Sepulcher. In the 11th century it belonged to the Benedictines and then to the Camaldolites. Later it was an independent commune. In the 15th century it belonged to the Church, which sold it to Florence in 1515. In spite of its recent growth, the appearance of the town is medieval. The Cathedral, formerly a Camaldolite abbey, was originally Romanesque (1012–49) but has been repeatedly remodeled. The stone façade, with three portals and a rose window, is part of the original Romanesque structure. S. Francesco (1258) has a Gothic portal and rose window; the interior, with a single aisle, was remodeled and enlarged in 1764. The high altar (1304) is Gothic; the inlaid wooden choir stalls are of the late 15th century. The cloister has a Gothic portal opening into the chapter house. S. Antonio (1345) is Gothic; over the portal is a lunette with a relief dated 1366. The Church of S. Maria dei Servi, completely rebuilt in 1884, contains works by Matteo di Giovanni (1487). Secular buildings of note include the Palazzo Comunale (13th–14th cent., remodeled); the Fortress (14th cent.), rebuilt by Alberto Alberti after 1561; the Palazzo Pretorio (14th cent.), rebuilt in 1840, decorated with glazed terra cottas from the Della Robbia workshop; and numerous truncated towers, including the Torre di Berta. There are many private houses and towers of the Renaissance period, among them the Palazzo Cherici, with frescoes and graffiti on the façade by Cherubino Alberti (1587); the house where Piero della Francesca is said to have been born (15th cent.); and the Palazzo delle Laudi, begun in 1591 by Alberto di Giovanni Alberti and completed by Antonio Cantagallina in 1609. S. Agostino, rebuilt in 1771, retains a 16th-century portal and the Romanesque campanile. S. Lorenzo (16th cent.) contains the *Deposition* by Il Rosso. S. Maria delle Grazie (1518) has a porch on the left side and a carved wooden ceiling by Alberto di Giovanni Alberti. The Pinacoteca Comunale, in the Palazzo Comunale, contains paintings of the Tuscan Renaissance, among which are the *Madonna of Mercy* (XI, PL. 157) and *The Resurrection* by Piero della Francesca.

Siena (Lat., Saena). Siena is situated on three hills in a zone inhabited by the Etruscans, but it arose as a city in the Roman republican period. The Middle Ages witnessed a struggle for power between the people and the nobility, and between Guelphs and Ghibellines (Siena was traditionally a Ghibelline city, as the rival of Guelph Florence), but the prosperity of the city grew as her merchants and bankers extended their sphere of activity all over Europe. In 1530 the city was occupied by the troops of Charles V, and in 1559 it became part of the Medici grand duchy under Cosimo I. Siena has retained its medieval aspect and plan, with buildings mainly of the 14th and 15th centuries.

The city is almost entirely surrounded by walls. There are 14th-century gates fortified with barbicans and battlements, of a design peculiar to Sienese military architecture. There are numerous public fountains (late 13th cent.), generally rectangular, with a vaulted covering opened by two or three Gothic arches. Siena has relatively little Romanesque architecture; examples include the apses of S. Andrea and S. Cristoforo (12th cent.), the portal of SS. Quirico e Giulitta, the campanile of S. Giorgio, and the façade of S. Maria in Betlem (Pisan, 13th cent.). The Cathedral was begun in Romanesque style in the 12th century, but the upper part of the façade was completed only in 1376 and the apse in 1382. The facing of the exterior (and of the Romanesque campanile built in 1313) is of white and black marble horizontal stripes. The façade, of white and colored marble, is Romanesque and Gothic, with three gables. The lower part was designed by Giovanni Pisano (1284–99). On the right side of the façade are the beginnings of structures intended to enlarge the Cathedral but abandoned in 1355. The interior is a Latin cross divided by compound piers and arches into a nave and two lateral aisles, with a dome above the crossing. The apse is very deep and has a stained-glass window designed by Duccio di Buoninsegna (1288). The interior repeats the pattern of black and white horizontal marble stripes of the exterior. The Piccolomini Library (1497), opening from the left aisle, was designed by Lorenzo di Mariano Fucci (Il Marrina) and is decorated with frescoes by Pinturicchio. It contains choir books with illuminations by Liberale da Verona, Girolamo da Cremona, Sano di Pietro, and others. The baroque Chigi Chapel (Cappella della Madonna del Voto), added in 1661, contains sculptures by Gian Lorenzo Bernini, Antonio Raggi, and Ercole Ferrata. The Chapel of S. Giovanni Battista (1482), by Giovanni di Stefano, has a portal by Il Marrina and frescoes by Pinturicchio. The inlaid marble floor (1369–1547) of the Cathedral is divided into 56 figured sections with Biblical scenes by Matteo di Giovanni, Neroccio, Pinturicchio, and Domenico Beccafumi (PL. 86), and others. The pulpit is by Nicola Pisano (VI, PL. 364; X, PLS. 322, 323). The tomb of Cardinal Petroni was carved by Tino di Camaino (1317–18). The high altar, by Baldassare Peruzzi (1532), is surmounted by a bronze baldachin by Lorenzo di Pietro (Il Vecchietta) and flanked by candelabra in the form of angels by Giovanni di Stefano (1482) and Francesco di Giorgio Martini (1497–99). The Baptistery, under the apse of the Cathedral, has a white marble Gothic façade (1382); the baptismal font has sculptured panels by Jacopo della Quercia (IV, PL. 149), Donatello, Lorenzo Ghiberti, Giovanni di Turino, and Turino di Sano.

There are many Gothic churches. S. Domenico, of Cistercian type (begun, 1226; remodeled and enlarged, 14th and 15th cent.), is T-shaped in plan, with an open trussed ceiling over the nave. It contains works by Sano di Pietro, Giovanni di Paolo, Francesco di Giorgio Martini, Matteo di Giovanni, Benvenuto di Giovanni, Ventura Salimbeni, Rutilio Manetti, and Mattia Preti. The Chapel of S. Caterina is decorated with frescoes by Sodoma (1526). S. Maria dei Servi (13th cent.; enlarged, 14th and 15th cent.) has two rose windows on the façade. The interior, in the form of a Latin cross, was remodeled on Renaissance lines, possibly by Peruzzi. Works in the church include the *Madonna del Bordone* by Coppo di Marcovaldo

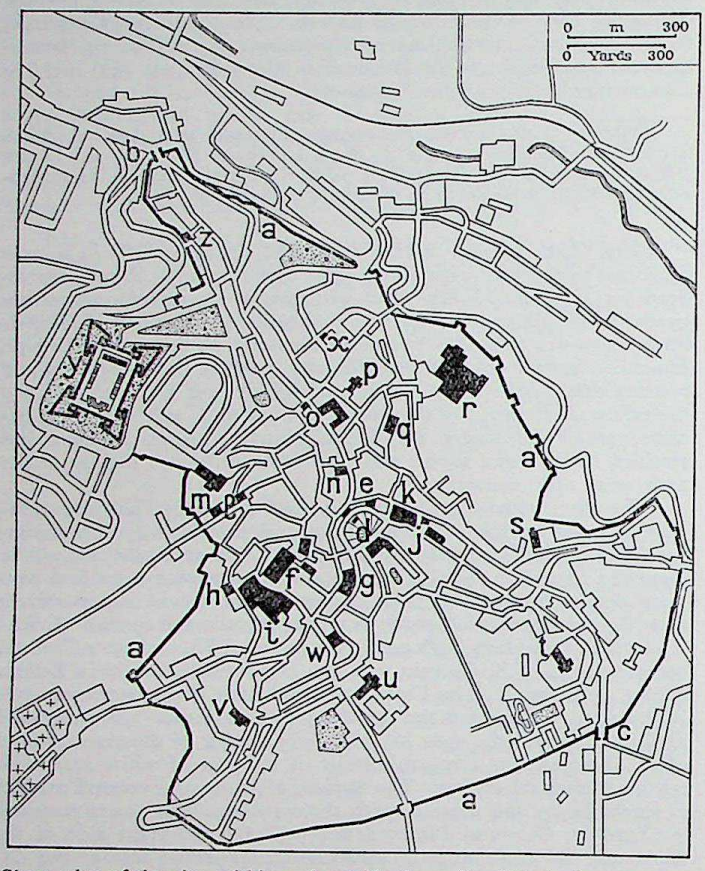
(1261) and others by Segna di Bonaventura, Rutilio Manetti, Taddeo di Bartolo, Matteo di Giovanni, Bernardino Fungai, Lippo Memmi (PL. 185), Giovanni di Paolo, and Pietro Lorenzetti. S. Francesco (begun 1326) was completed in 1475 from a design attributed to Francesco di Giorgio Martini. It has been altered and restored several times. The interior consists of a single aisle and contains frescoes by Pietro and Ambrogio Lorenzetti (IX, PLS. 191, 197). S. Agostino (1258) has a Gothic apse of the 14th century; the interior was remod-



Siena, plan of the city, within and outside the walls. Principal monuments: (*a*) City walls; (*b*) Porta Camollia; (*c*) Porta Romana; (*d*) Piazza del Campo, Fonte Gaia, and Palazzo Pubblico; (*e*) Loggia della Mercanzia and Palazzo Sansedoni; (*f*) Palazzo del Magnifico, Cathedral, and Museo dell'Opera del Duomo; (*g*) Palazzo Chigi-Saracini; (*h*) S. Sebastiano; (*i*) Hospital of S. Maria della Scala and Palazzo del Capitano di Giustizia; (*j*) Logge del Papa and Church of S. Martino; (*k*) Palazzo Piccolomini; (*l*) Fonte Branda; (*m*) S. Domenico; (*n*) Palazzo Tolomei; (*o*) Palazzo Salimbeni and S. Maria delle Nevi; (*p*) S. Donato; (*q*) S. Maria di Provenzano; (*r*) S. Francesco, Seminary, and Oratory of S. Bernardino; (*s*) Sto Spirito; (*t*) S. Maria dei Servi; (*u*) S. Agostino; (*v*) Palazzo Pollini-Neri and S. Maria del Carmine; (*w*) Pinacoteca Nazionale (Palazzo Buonsignori); (*x*) Fonte Nuova; (*y*) former Forte di S. Barbera (16th cent.); (*z*) Church of Fontegiusta.

eled in 1775 by Luigi Vanvitelli. It contains works by Perugino, Matteo di Giovanni, Sodoma, and Simone Martini.

The most important medieval secular buildings are those facing the great shell-shaped Piazza del Campo (I, PL. 390). The Palazzo Pubblico (VI, PL. 339), begun at the end of the 13th century, was enlarged in the 14th century with the addition of the prisons (1327), the Council Chamber (1330–42), and the Torre del Mangia (1338–48). The brick tower, 387 ft. high, by Minuccio and Francesco di Rinaldo, is surmounted by turrets built by Agostino di Giovanni from a design attributed to Lippo Memmi. In the various chambers and halls are frescoes by Ambrogio Lorenzetti (IX, PLS. 194–196), Sano di Pietro, Sodoma, Andrea di Bartolo, Domenico di Bartolo, Il Vecchietta, Taddeo di Bartolo, Spinello Aretino and Parri Spinelli (VII, PL. 272), and Simone Martini (IX, PL. 332). The Cappella di Piazza was begun in 1352 by Domenico di Agostino but was altered and demolished several times before it was completed in 1376 by Giovanni di Cecco. Antonio Federighi added the Renaissance arches and coping (1463–68). The Palazzo Sansedoni (1216, enlarged in 1339), with a curved façade, has a rhomboid tower. Also facing the square is the rear façade of the Loggia della Mercanzia, remodeled in 1763 by Ferdinando Fuga. In the center of the piazza is the Fonte Gaia, a fountain designed by Jacopo della Quercia (1409–19). The reliefs are copies of the originals, now in the Palazzo Pubblico (IV, PLS, 149, 150). Other noteworthy Gothic buildings are the Castellamare, the Forteguerri tower-house, the Palazzo Tolomei (13th cent.), the Palazzo del Capitano di Giustizia (13th–14th cent.), Palazzo Buonsignori (early 15th cent.), Palazzo Chigi-Saracini (14th cent., enlarged in 1787), the Palazzo Salimbeni (14th cent., restored in 1879), and the Palazzo di Giustizia.

The city has a number of Renaissance buildings, including S. Maria delle Nevi (1471); S. Caterina in Fontebranda (1474); and the Church of Fontegiusta (1482–84), on a square plan, with a tripartite nave and frescoes by Baldassare Peruzzi (XI, PL. 119) and others. S. Maria del Carmine, originally a 14th-century church, was rebuilt in 1517, probably by Peruzzi. Of the 15th century are the Oratory of S. Bernardino, with frescoes by Beccafumi, Sodoma, and Girolamo del Pacchia; S. Maria degli Angeli; and Sto Spirito (1498), with a portal (1519) attributed to Peruzzi, dome by Giacomo Cozzarelli, and frescoes by Beccafumi, Sodoma, and others. S. Maria di Provenzano was built in 1594 by Flaminio del Turco; the interior is baroque. S. Martino (1537) has a façade by Giovanni Fontana (1613); in the interior are works by Guido Reni, Guercino, and Beccafumi.

Secular palaces of the period include the Piccolomini (delle Papesse), by Bernardo Rossellino (1460–95), the Spannocchi, begun in 1470 by Giuliano da Maiano; the Bichi Ruspoli (1520); the Piccolomini-Adami (formerly Chigi), with rooms frescoed by Bernart van Orley; the Bindi-Sergardi; the Palazzo del Governo, designed by Bernardo Buontalenti; the Palazzo del Magnifico (1508); the Tantucci (1548), by Bartolomeo Neroni (Il Riccio); and the Pollini (now Neri), by Baldassare Peruzzi. *Museums*: Museo dell'Opera del Duomo, with sculptures by Giovanni Pisano, the *Maestà* by Duccio di Buoninsegna, works by the Lorenzettis, and objects formerly in the Cathedral; Pinacoteca Nazionale (in the Palazzo Buonsignori), with works by Sienese painters of the 12th to 16th century; Museo Archeologico, with Villanovan, Etruscan, Greek, and Roman material; Archivio di Stato, in the Palazzo Piccolomini, collection of painted *Tavolette di Biccherne*, wooden covers for the semiannual fiscal accounts of the city; Museo del Seminario Arcivescovile; and the museum of the Società di Esecutori di Pie Disposizioni, Sienese religious art.

Sovana (Etruscan, Suana). An abandoned village near Sorano (where there is a fortress of the Orsini family), Sovana has remains of the Etruscan walls and of an urban temple of the 3d or 2d century B.C. Outside the village is an important Etruscan necropolis hewn from the rock, with tombs of various types: some on a square column base, some with portico and a tympanum, others in the form of a temple or a shrine (Tomba Ildebranda, Grotta Pola). The town is medieval in character, with a few notable houses and a Romanesque Cathedral (12th–13th cent.); the Church of S. Maria (12th cent.); and the ruined Rocca Aldobrandesca, a fortress.

Pitigliano, on the summit of a volcanic ridge nearby, was also an Etruscan city (unidentified, but possibly Catetia). Of the Etruscan period are traces of the town (late period), fragments of the walls, and a large necropolis, with tombs of the 7th–5th century B.C. The medieval part of the town has remained almost intact. It is dominated by the large Orsini palace (14th–16th cent.). Also of interest are S. Maria (1506) and the Cathedral (16th cent.), with a baroque façade.

There are a number of Etruscan sites in the neighborhood, including Statonia and Saturnia.

Vetulonia [Etruscan, Vatl(u)na]. A prosperous Etruscan city in the archaic period, it declined in the 5th century B.C., flourished again in the Hellenistic and Roman period, and was destroyed at an unknown date. The walls of the acropolis (6th–4th cent. B.C.) and remains of houses and shops of the later period (3d–1st cent. B.C.) are still visible. The necropolis contains Villanovan, Orientalizing, and archaic tombs. Some bronzes found here show influences of the Sardinian nuraghe culture (8th–6th cent. B.C.). The largest tomb is the Tumulo della Pietrera. Sculptures and grave furnishings from this and other tombs are now in the Museo Archeologico in Florence. Some Etruscan and Greco-Roman artifacts are in the local Museo Archeologico.

Volterra (Etruscan, Velathri; Lat., Volaterrae). Situated on the summit of the uplands between the valleys of the Era and the Cecina rivers, this was a powerful Etruscan city. In the 3d century B.C. it became a Roman municipium. In the Middle Ages it was ruled by bishops, but in the 12th century it became an independent commune; in 1472 it was conquered by the Florentines. Etruscan girdle walls, of a local stone called *panchina*, are well preserved; they were extended in the 4th and 3d centuries B.C. To this period belong the Porta dell'Arco (V, PL. 48), of which the piers and the protomas are Etruscan. There are also remains of Etruscan sacred buildings in the Pian di Castello, the ancient acropolis, and the Roman theater (1st cent. B.C.–1st cent. of our era), beyond the Porta Fiorentina.

The present aspect of Volterra is medieval. Around the central square, Piazza dei Priori, are the Palazzo Pretorio (13th cent.; altered and enlarged several times), with a loggia and double-arched windows and the attached Torre del Podestà; Palazzo dei Priori (1208–54), with a crenelated tower; and the bishop's palace (remodeled 1472). The Romanesque Cathedral (12th cent.; rebuilt, 13th and 14th cent.) has a tripartite nave with a 15th-century coffered wooden ceiling. It contains a 12th-century marble pulpit (restored 17th cent.), a *Deposition* of carved and painted wood of the 13th century, and carved wood choir stalls (1404). The canopy of the altar and several other sculptures are by Mino da Fiesole; there are frescoes in the presbytery and nave by Cristoforo Roncalli (Il Pomarancio). The Baptistery (13th cent.) is octagonal, with a white and green marble façade; the interior, with a single aisle, was remodeled in 1826. There are several medieval houses and towers, including the tower-house of the Buomparenti family (13th cent.), the three Cafferecci towers (14th cent.), and the houses of the Alegretti, Baldinotti, and Miranceli families. The Church of S. Francesco has been almost entirely rebuilt; the nave has a trussed wooden ceiling, and in the Gothic Chapel of Sta Croce di Giorno (1315) are frescoes by Cenni di Francesco di Ser Cenni (1410).

S. Antonio Abate and S. Pietro in Selci are of the 15th century. S. Pietro was altered in 1507 and has a baroque façade. The Fortress was begun in 1343, rebuilt and enlarged in the 15th and 16th centuries. Of the 16th century are the Palazzo Solaini, attributed to Antonio da Sangallo the Elder; the Palazzo Maffei (1527); and the Palazzo Viti, attributed to Bartolommeo Ammanati. Ammanati is also credited with the façade of the Badia, a Romanesque church which was rebuilt at various times and finally collapsed in 1895, although the façade and the Renaissance cloister have survived. The Church of SS. Giusto e Clemente is baroque, on a Latin-cross plan with a single aisle; it is decorated with frescoes by Volterrano (1631) and works by Il Pomarancio. *Museums*: Museo Guarnacci, with Etruscan antiquities from local excavations; Pinacoteca Comunale, with paintings by Florentine, Sienese, and Volterran artists, 14th–17th century; Museo Diocesano di Arte Sacra.

Umbria. In ancient times this region was inhabited, east of the Tiber, by the Umbri and, west of it, by the Etruscans, who left significant monumental evidence of their civilization around Perugia and Orvieto. Under the Romans a number of settlements grew up along the Via Flaminia, the main Roman artery through central Italy. Many architectural remains of these once flourishing ancient centers are perceptible amid the predominantly Romanesque and Gothic lineaments of towns and cities that became independent communes during the Middle Ages.

Early Umbrian paintings and stone and wood sculpture reveal Romanesque and Byzantine influences; subsequently, Tuscan influence became more decided — especially in the work of the great artists at the Franciscan sanctuary of Assisi and in Orvieto — and reached its height during the Renaissance, in the works of Perugino, Raphael, and other artists of the Umbrian school. Throughout every period the applied arts and local handicrafts — such as textiles, embroidery, metalworking, and ceramics — have been important.

Amelia (Lat., Ameria). Located on the watershed between the Tiber and Nera rivers, Amelia was a city of the Umbri; later it became a Roman municipium. From ancient times there remain massive polygonal walls (restored several times), on which the medieval walls were raised.

The Church of S. Francesco (1287; interior remodeled 1767) has a Gothic portal and contains the tomb of Geraldini by Agostino di Duccio. The Cathedral — a Romanesque structure, remodeled in 1640, in which the original twelve-sided campanile was retained — contains paintings by Niccolò Pomarancio (Circignani), monuments of two members of the Farrattini family by Ippolito Scalza (1534), and sculpture of the school of Agostino di Duccio. The Church of S. Pancrazio was built in the 14th century, but its interior was remodeled in 1747. Dating from the Renaissance period are Palazzo Ferrattini, attributed to Antonio da Sangallo the Younger; Palazzo Petrignani, with frescoes by artists of the school of Zuccari; and on the outskirts of the city, Rocca di Albino (1455–1511; present-day Doria Pamphili), a square castle with corner towers and a central courtyard. The Palazzo Comunale, which houses an archaeological collection in its entrance hall, is also noteworthy.

In the neighboring village of Lugnano in Teverina is the Romanesque church of S. Maria Assunta (12th cent., remodeled 15th cent.), which has a façade with a portico of the 13th century and, in the interior, an altar, ciborium, iconostasis, and *schola cantorum* of the 13th century — poorly restored — and a triptych by Niccolò Alunno.

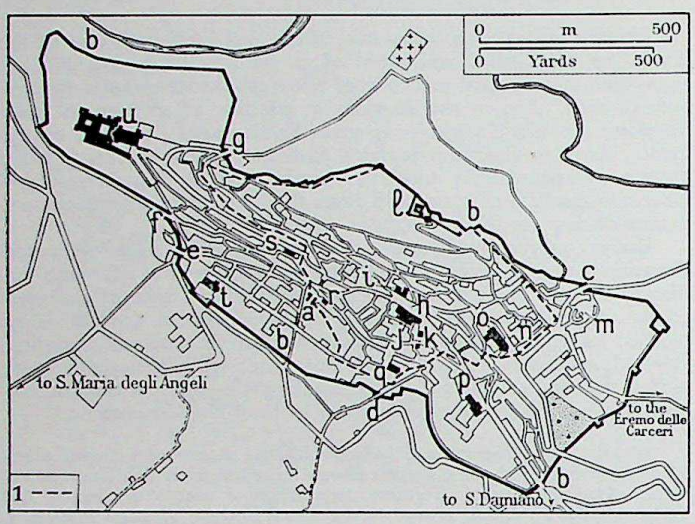
Assisi (Lat., Assisium). Situated on the northwest slope of Mt. Subasio, this was a town of the Umbri, later a Roman municipium. Dating from the Roman period are remains of the walls and, on one side of the forum, the so-called "Temple of Minerva" (probably 1st cent. B.C.), with a hexastyle Corinthian pronaos, which was converted into the Church of S. Maria sopra Minerva in the 16th century, then remodeled by G. Giorgetti in the 17th century and renamed S. Filippo Neri. Remains of the forum, with a tribunal and



Assisi, plan. *Key*: (1) Boundary of the Roman city. Principal monuments: (*a*) Roman gate; (*b*) medieval walls; (*c*) Porta Perlici; (*d*) Porta Moiano; (*e*) Porta S. Pietro; (*f*) Porta S. Francesco; (*g*) Porta S. Giacomo; (*h*) Piazza del Comune, over remains of the Roman forum; (*i*) Palazzo del Capitano, Torre del Popolo, and the so-called "Temple of Minerva"; (*j*) Palazzo Comunale (Pinacoteca); (*k*) Chiesa Nuova and Oratory of S. Francesco Piccolino; (*l*) Rocca Maggiore; (*m*) area of the Roman amphitheater; (*n*) area of the Roman theater; (*o*) Cathedral (S. Rufino); (*p*) S. Chiara; (*q*) S. Maria Maggiore, over a Roman house; (*r*) Oratory of S. Francescuccio; (*s*) Monte Frumentario; (*t*) S. Pietro; (*u*) Basilica and Monastery of S. Francesco.

a shrine to Castor and Pollux, are visible below the piazza. Under the episcopal palace is a house with frescoes. There are also remains of a theater and of an amphitheater.

In Lombard times the city belonged to the Duchy of Spoleto, but after the 11th century it became a prosperous free commune. During the 12th and 13th centuries the city was encircled with walls (which still exist) and fortified. Of the eight gates along the walls, the best preserved is the 12th-century Porta S. Pietro. The larger of the two medieval fortresses, the Rocca Maggiore, was demolished in the 12th century and rebuilt in the 14th. The city expanded as narrow, winding streets and small piazzas were added, and it still retains its medieval appearance. Between the 11th and 13th centuries the Cathedral (S. Rufino) was built, in Lombard Romanesque style, on the site of a 9th-century church, the crypt of which remains; the interior, remodeled in 1571 by Galeazzo Alessi, has wooden choir stalls by Giovanni di Pier Giacomo of San Severino. S. Maria Maggiore, the former Cathedral, was rebuilt in the 12th century by Giovanni da Gubbio, also in Romanesque style, over a Roman structure probably dating from the 4th century. The interior of this church bears traces of 14th- and 15th-century frescoes. The Museo Capitolare contains two 15th-century triptychs, one by Niccolò Alunno, another by Matteo da Gualdo. Also Romanesque are the small churches of S. Giacomo ("de muro rupto"), with a cross-vaulted ceiling; S. Giorgio, incorporated into the Convent of S. Chiara; and S. Maria delle Rose.

The most famous structure in the city, S. Francesco, with its monastery, belongs to the Gothic period. Begun in 1228 and consecrated in 1253, the edifice consists of two superimposed churches, supported by massive retaining walls. The Upper Church (I, PL. 386) is single-aisled, with a transept and a polygonal apse; the Lower Church is built on a similar plan, but with side chapels, a narthex, and a crypt. The façade (PL. 186), on the level of the Upper Church, is divided into three horizontal areas and has a double rose window encircled with Cosmati ornamentation. Some of the most noted artists of the 13th and 14th centuries contributed their talents to the frescoes of S. Francesco: Cimabue (1277) was responsible for the transept and the vault of the apse — both in poor condition — in the Upper Church (III, PLS. 324–326), as well as the Madonna, angels, and St. Francis in the Lower Church (III, PL. 328); artists of the Roman school illustrated stories from the Old and New Testaments in the Upper Church; Giotto (q.v., for problematical dating of his work here) added scenes from the life of St. Francis in the Upper Church (VI, PLS. 196–198); pupils of Giotto, the so-called "Master of the Assisi Vault" outstanding among them, painted the majority of the frescoes in the Lower Church; Pietro Lorenzetti and his pupils embellished (ca. 1325–30) the left wing of the transept of the Lower Church (VI, PL. 62; IX, PLS. 188, 189); Simone Martini decorated the Chapel of St. Martin (1322–26) and executed some of the frescoes in the transept of the Lower Church (IX, PL. 333). Attached to S. Francesco is the friary, Sacro Convento, with a chapter house (13th cent.), a refectory (18th cent.), the portico known as "Calce" (1300), and cloisters (the large cloister, built in 1476, probably designed by Antonio da Como), as well as the treasury.

The Church of S. Pietro, a Romanesque structure rebuilt during the Gothic period, has a basilican plan that retains some of the original Romanesque character; its three aisles are divided by piers and its presbytery is surmounted by a cantilevered cupola. Within are 14th-century tombs (along the walls) and a triptych by Matteo da Gualdo. The Church of S. Chiara, consecrated in 1265, has a rose window over a portal in transitional style, and its walls are faced with bands of white and red marble, the left wall supported by flying buttresses. Its interior is decorated with frescoes by followers of Giotto and a panel (13th cent.) by the Master of S. Chiara, depicting scenes from the life of St. Clare, as well as with a 13th-century crucifix, perhaps also by the same artist.

Secular buildings of the 13th and 14th centuries include houses on the Via di Porta Perlici, whose gate dates from the 12th century, and the following edifices, built on the site of the Roman forum: Palazzo del Capitano del Popolo, with a battlemented tower (1212–1305); Palazzo Comunale (or dei Priori; 1337), which now contains the Pinacoteca Comunale of works predominantly by Umbrian artists; and not far from it, Palazzo dei Consoli (1225) and the portico of Monte Frumentario (1267).

Dating from the Renaissance period are the arcade of Piazza di S. Francesco (1476); the Oratory of S. Bernardino, with fine reliefs by the brothers Girolamo, Bartolomeo, and Francesco Zampa of Assisi (1488); the Bindangoli palace designed by Giulio Danti; the reconstructed Oratory of the Pilgrims (rebuilt 1431), which has frescoes by Matteo da Gualdo, and Casa dei Maestri Comacini (rebuilt 15th cent.) — both originally 13th-century structures; and from the latter half of the 16th century, Fonte Marcella and Fonte Oliviera. Other buildings of interest are the Chiesa Nuova (begun 1615), built in the form of a Greek cross with one central dome and domes on each of the four arms, which has decorations by Cesare Sermei; the 17th-century Bernabei, Giacobetti, and Vallemani palaces, all by Giacomo Giorgetti; and the Museo Civico, noteworthy for its archaeological collection.

Just outside the city walls stands the Church of S. Maria degli Angeli, which was designed by Galeazzo Alessi, Giacomo Giorgetti, and Girolamo Martelli (begun 1569; completed 1679); having been partly destroyed by an earthquake in 1832, it was rebuilt by Luigi Poletti in 1836–40. Its Neo-Renaissance façade was designed by Cesare Bazzani in 1928. The interior is based on a basilican plan, with three aisles, transept, and a dome that dates from the original building. Incorporated into this structure are the Porziuncola, a simple 12th-century oratory with decorations of various periods and styles; the Oratory of S. Bonaventura and the Cappella del Roseto, both with frescoes by Tiberio d'Assisi (1506, 1518); and the Cappella del Transito, with frescoes by Giovanni di Pietro (Lo Spagna) on the interior (ca. 1515) and by Domenico Bruschi on the exterior (1886), and containing a terra-cotta statue of St. Francis by Andrea della Robbia. Against one of the church walls is the Fonte delle 26 Cannelle (1610). Adjoining the church are the Conventino di S. Bernardino da Feltre, which contains a *Last Supper* by Niccolò Pomarancio, and the old convent begun in the time of St. Francis, as well as the Museo della Basilica di S. Maria degli Angeli, with a panel by the St. Francis Master, a *Crucifixion* by Giunta di Bonagiunta, and other paintings by Sano di Pietro and Niccolò Alunno.

On the outskirts of the city, to the southeast, is the early-13th-century church of S. Damiano (containing 15th- and 16th-century works); adjacent are the convent and cloister, as well as the Oratory of S. Chiara (14th-cent. frescoes). East of the city, on Mt. Subasio, stands the Eremo delle Carceri (15th cent.).

Bevagna (Lat., Mevania). Bevagna was a prosperous municipium on the Via Flaminia in Roman times. In the 13th century the walls that still stand were built over the remains of the ancient walls, which were made of small stone blocks and bricks. Remains of a pseudo-peripteral temple, a theater (1st cent. of our era), and thermae with a fine mosaic of marine animals (2d cent.) are to be found near the original site of the ancient forum. The most important medieval monuments (restored) are located on the main piazza, which on the whole retains its medieval appearance. The Church of S. Silvestro (1195), a Romanesque structure designed by Binello and Rodolfo da Bevagna, has an unfinished façade with a carved portal; its interior is basilican, divided by columns, and the presbytery is built over a crypt. The Church of S. Michele (12th–13th cent.; interior recently restored), also by Binello and Rodolfo, exhibits a carved portal with Cosmati decoration, a massive campanile, and a crypt. Other churches worth noting are S. Francesco, with a 13th-century façade and an interior dating from 1756; S. Margherita, built in 1271 and remodeled in 1640; and S. Filippo, a 17th-century edifice. The Palazzo dei Consoli (1270) is a Gothic structure, with a portico on the lower floor, a wide outside staircase, and two rows of twin-arched windows. In the Palazzo Comunale is the Pinacoteca Comunale. Bevagna also has an Antiquarium housing a Roman collection.

Pietrangeli, Guida di Bevagna, Spoleto, 1959.

Città di Castello (Lat., Tifernum, Tiberinum). This ancient town of the Umbri later became a Roman municipium. Dating from the Roman period are remains of edifices decorated with mosaics, including ruins of what were probably thermae in the Rignaldello district. Pliny the Younger owned large estates in this region, as well as the villa "In Tuscis," vestiges of which remain on Colle Plinio. The town was destroyed by Totila in the 6th century, but it rose again as Castrum Felicitatis. Its present name dates from the 10th century. During the Middle Ages it was initially an independent commune; later it became subject to other cities and then to the Church, and from the mid-15th century it was dominated by the Vitelli family.

The Palazzo del Governo (or del Podestà) dates from the 14th century and is attributed to Angelo da Orvieto; one of the wings is Gothic, but the façade of the building is baroque (1686). The Palazzo Comunale, by Angelo da Orvieto, is a Gothic structure in rustic ashlar masonry, with a wide twin-arched portal. S. Domenico, a late Gothic church rebuilt in 1424, is single-aisled and is decorated with frescoes of the 14th and 15th centuries; adjoining it is a cloister.

To the Renaissance period belong the Church of S. Maria Maggiore (considerably remodeled), which has 15th-century frescoes; S. Maria delle Grazie; Palazzo Bruni-Bufalini; and two other palaces —Palazzo Vitelli alla Cannoniera, built by Antonio da Sangallo the Younger (with sgraffito designs by Vasari on its façade), and Palazzo Vitelli at the Porta Sant'Egidio (1540), possibly built from designs by Vasari and richly decorated with frescoes by Prospero Fontana and others. The Pinacoteca Comunale (Palazzo Vitelli alla Cannoniera) contains paintings by Umbrian and Tuscan artists.

The Cathedral, originally a Romanesque building, was enlarged in 1356 and remodeled between 1466 and 1529. Of the original Romanesque structure only the cylindrical campanile remains; a lateral portal from the 14th-century Gothic addition has been preserved. The baroque façade was begun in 1632 by Francesco Lazzari but left unfinished. The single-aisled interior is Tuscan Renaissance in style and has an 18th-century wooden ceiling. Attached to the Cathedral is the Museo Capitolare, which contains religious objects, including a 12th-century gilded silver altar frontal with reliefs.

Other noteworthy buildings include the Church of S. Francesco, rebuilt in the early 18th century, incorporating the apse and a portal from the original Gothic church of 1273 and containing the Renaissance Vitelli Chapel by Vasari; Castello Bufalini (built in 1492; altered by Vasari), located nearby at San Giustino, with a collection of 15th-, 16th-, and 17th-century paintings; and the Sanctuary at Canoscio, built by Emilio de Fabris in 1855–78, where an important collection of Early Christian objects was found.

Foligno (Lat., Fulginiae; med., Fulginium). Situated in the center of a wide plain at the junction of the Topino and Clitunno valleys, this city of the Umbri was conquered by the Romans in about 295 B.C., and thereafter became a municipium. The regular layout of the Roman city is still clearly visible; the principal streets of the modern city correspond to the ancient *decumanus* and *cardo maximus*. Vestiges of the Roman period also include four bridges, remains of an arch, and ruins of a villa called "Palazzo di Decio".

In the Middle Ages Foligno was a free commune, but possession then passed to the Church in the 13th century, a time of renewed building activity in the city. Among the palaces constructed during the medieval period are Palazzo del Podestà (1190), which was remodeled in the 16th century and restored extensively in the present century; Palazzo della Canonica, a 14th-century Gothic structure, later almost entirely rebuilt; Palazzo Trinci, a 14th-century edifice with a neoclassic façade and 15th-century additions, which contains a loggia (with frescoes attributed to Lorenzo Salimbeni of Sanseverino), a chapel with frescoes by Ottaviano di Martino Nelli (1424), and the Pinacoteca Comunale; and the Palazzetto by Gentile da Foligno (14th cent.).

Many churches were also built during this period, among them: S. Maria Infraportas, Romanesque in form (basilican in plan, with three aisles divided by piers) but actually originating in an earlier period, with frescoes of the 12th and 16th centuries by Pierantonio Mezzastris, Ugolino di Gisberto, and others; S. Caterina, of which only the façade (1251) remains; S. Giacomo, with a chapter house and 15th-century cloister; S. Claudio, built about 1240 (interior reconstructed); and S. Salvatore, a 14th-century structure of white and red masonry (interior remodeled).

The Cathedral, begun in 1133, had its principal façade restored during the present century; the secondary façade, by Rodolfo and Binello da Bevagna, has a fine Romanesque portal (1201). The interior, with nave and transept, was rebuilt in the 16th century (only the Chapel of the Sacrament, designed by Antonio da Sangallo the Younger, remains from this period) and further remodeled by Giuseppe Piermarini (1771) in neoclassic style.

Renaissance architecture survives in the following buildings: Church of the Nunziatella (1494), with paintings by Perugino; Church of S. Nicolò (begun 14th cent., remodeled 16th cent.), with works by Niccolò Alunno and apse decorations by Sebastiano Conca; Palazzo Comunale (which acquired a neoclassic façade by Ireneo Aleandri in the baroque period), with a 15th-century battlemented tower; Palazzo Deli, designed in the 16th century by Baccio d'Agnolo Baglioni; and also dating from the 16th century, the Pesci-Feltri, Cybo, and Orfini palaces, and the old hospital (1517), converted into a school.

Dating from the baroque period are the Ubaldi, Mancia-Salvini, and Barnabò palaces.

In the vicinity of Foligno are other structures worth noting: the Church of S. Giovanni Profiamma (early 13th cent.), with a three-aisled basilican interior, raised presbytery, and an Early Christian crypt (possibly 6th cent.); the Romanesque-Gothic church of the Madonna della Fiammenga; the Abbey of Sassovivo, with a cloister (1229) and the original crypt (11th–12th cent.); the Church of S. Maria in Campis (14th–15th cent.; partly destroyed by an earthquake in the 19th cent. and rebuilt), decorated with frescoes by Umbrian painters, chiefly Pierantonio Mezzastris and Niccolò Alunno; in the village of Sant'Eraclio, the Trinci Castle (15th cent.), of which the outside walls and two towers remain.

Gubbio (Lat., Iguvium; med., Eugubium). City of the Umbri; seven bronze tablets with ritual texts in the ancient Umbrian language are preserved in the Palazzo dei Consoli. It became a municipium under the Romans. From the Roman period there are ruins of a large theater (ca. mid-1st cent.) and remains of thermae and of a mausoleum known as the tomb of Genzio or of Pompino Grecino.

The city has retained its medieval appearance; the main streets, with houses in ashlar masonry, run parallel to each other at different levels. The Cathedral — a 13th-century single-aisled structure with a very wide nave, a large portal, a rose window, and 13th-century sculpture on its façade (remodeled 16th cent.) — contains paintings by 16th-century artists of Umbria and the Marches as well as a rich treasury. Other 13th-century churches include: S. Pietro (greatly restored); S. Agostino (with a modern façade), the nave and presbytery of which were decorated by Ottaviano di Martino and his pupils; S. Francesco (built by Fra Bevignate of Perugia, 1259–92), with three polygonal apses, the left apse frescoed by Nelli or one of his followers; and S. Giovanni Battista, a single-aisled church with a square apse that has been restored in modern times. S. Secondo, originally also a 13th-century edifice, retained only the polygonal apse of the original structure when the church was rebuilt in the 15th century. Noteworthy among the secular buildings of the 13th century are Palazzo del Capitolo and Palazzo del Bargello.

Fourteenth-century structures include the Palazzo Pretorio, designed by Gattapone (Matteo di Giovannello di Maffeo), and the Palazzo dei Consoli, surmounted by battlements and a small tower, designed by Gattapone and Angelo da Orvieto (housing the Museo e Pinacoteca Comunali, an archaeological collection and a gallery of paintings by artists of the Umbrian school). The Church of S. Domenico, which contains 15th-century frescoes, dates from the 14th century, but its interior has been remodeled. The Church of S. Maria Nuova has a simple ogival portal, an arcaded side wall, and interior frescoes by Nelli and others (PL. 186). Dating from the 15th century are the Palazzo Ducale (with a porticoed interior court in Renaissance style), probably designed by Luciano Laurana, in imitation of the palace at Urbino; Palazzo della Porta, which has a fine Renaissance portal; and Palazzo Beni. The Church of S. Ubaldo is also a 15th-century structure, with a nave and four aisles, but much of it has been rebuilt. Later noteworthy constructions include the 18th-century Church of the Madonna del Prato, built in the form of a Greek cross, and the neoclassic Palazzo Ranghiaschi-Brancaleoni.

Devoto, Tabulae Iguvinae, Rome, 1940; Gubbio: Chiesa di S. Francesco, Arti figurative, I, 1945, p. 89; EAA, s.v.

Montefalco (med., Corcurione). Destroyed in 1249, the town was rebuilt in the 14th century, and later came into possession of the Church. Medieval in appearance, with turreted walls and gates of the 14th and 15th centuries, Montefalco stands on a hill overlooking the plain of Foligno. Ruins remain of the Church of S. Bartolomeo (11th–12th cent.), which belonged to the older, Romanesque town. S. Agostino (begun 1275; enlarged 1327), a single-aisled church with a polygonal apse, is decorated with frescoes by Umbrian and Sienese painters of the 14th, 15th, and 16th centuries. The Porta di S. Bartolomeo, a gate with towers, was built by Emperor Frederick II in 1244. The Palazzo Comunale, begun in 1270 but later remodeled, has a 15th-century portico. S. Francesco, an early-14th-century church converted into a museum (Pinacoteca Comunale), has a Renaissance portal and a 16th-century wooden door; it is decorated with 15th- and 16th-century frescoes, including scenes from the life of St. Francis by Benozzo Gozzoli (1452), and works by Francesco Melanzio, Pierantonio Mezzastris, and Perugino. S. Illuminata (16th cent.), a single-aisled church with lateral niches, is decorated with frescoes by artists of the local school such as Melanzio (early 16th cent.). The Oratorio di S. Maria di Piazza (or del Popolo) also contains frescoes by Melanzio (1490). The Scorzoni, Pambuffetti, and Senili palaces belong to the 15th century, while the Palazzo Camilli dates from the 16th century. Adjacent to the Church of S. Chiara, a medieval structure greatly remodeled in the 17th century, is the Cappella di Sta Croce, the walls of which are covered with frescoes by Umbrian painters (1333). S. Maria Maddalena is another remodeled (18th cent.) medieval church, with 15th- and 16th-century frescoes by artists from Foligno and Gubbio. On the outskirts of Montefalco is the Church of S. Fortunato (5th cent.; rebuilt 15th cent.), which has a colonnaded 14th-century portico decorated with frescoes by Benozzo Gozzoli (1450) and Tiberio d'Assisi, as well as a chapel frescoed by Tiberio (1512).

Narni (Umbrian, Nequinum; Lat., Narnia). This city was founded as a colonia by the Romans in 299 B.C. on the site of the Umbrian Nequinum, which they had destroyed during a long siege. A station on the Via Flaminia, it was strategically important during a civil war in A.D. 69 and in the wars against the Goths. From the Roman period there remain two gates on the Via Flaminia, as well as an arch and two pylons of a triple-arched viaduct (1st cent.).

Narni acquired its present appearance during the Middle Ages, when it was a flourishing and prosperous city. (Its prosperity declined after the city was sacked in 1527 by the imperial troops of Charles V.) The city, which was encircled by a wall with towers during the medieval period, is dominated by a citadel (Rocca) at its southeastern end; rectangular in plan, with towers at the corners, the Rocca was built in 1370 and modified in the 15th century. Attached to the Cathedral is a rare example of Early Christian art, the shrine of SS. Giovenale e Cassio (6th cent.), which has a façade decorated with sculpture and 9th-century mosaics. The Cathedral itself (12th cent.) is a Romanesque structure, basilican in plan, with its main portal decorated with sculpture; in the 15th century, a porch was added and the interior altered by the addition, on the right, of a third aisle. Within are notable examples of 15th- and 16th-century art, including a wooden statue of St. Anthony Abbot by Il Vecchietta (Lorenzo di Pietro). S. Maria in Pensole (1175), a Romanesque church with sculptured portals, has a porch with surbased arches and contains a crypt (possibly 9th cent.). The Church of S. Domenico (12th cent.) was also built in Romanesque style, but only the carved portal and campanile of the original remain. S. Francesco (14th cent.), a Gothic church with nave and two aisles, and a polygonal apse, contains traces of 15th- and 16th-century frescoes. The Church of S. Agostino (15th cent.) is a Renaissance structure, with frescoes by Lorenzo di Cristoforo Torresani (16th cent.).

Many of the medieval towerlike houses still stand. The Piazza Priora, completely medieval in appearance, is the site of Palazzo del Podestà (Comunale), a combination of three 13th-century buildings (altered 16th cent.); the Loggia dei Priori (mid-14th cent.); and a fountain with a polygonal basin (1301), a design like that of the Fontana Maggiore in Perugia. The Pinacoteca Comunale is located in the Palazzo Comunale.

Norcia (Lat., Nursia). Situated at the edge of a plain (Piana di Santa Scolastica) in the heart of the Umbrian Apennines, this Sabine city was conquered by the Romans in 290 B.C. Traces of this later phase of its history remain in the many Roman ruins incorporated in the foundations of later edifices. In the Middle Ages Norcia became a prosperous commune, and afterward the seat of a prefecture of the Papal States. The city walls were built in the 14th century, and the notable buildings of the city also date from that period.

S. Benedetto, a Gothic church (rebuilt late 14th cent.) with a richly ornamented façade and a remodeled interior, stands over the ruins of a Roman structure (probably a public building, late 1st or early 2d cent.), traces of which are visible in the crypt. The Church of S. Agostino is also a 14th-century Gothic structure; however, its interior was remodeled in the 17th century. There are Gothic elements in the churches of S. Francesco and S. Giovanni, as well as in the Cathedral (16th cent.), which incorporates the Gothic portal and the campanile of the Church of S. Maria Argentea (destroyed early 14th cent.). The Church of S. Filippo dates from the 18th century. The Palazzo Comunale, remodeled and enlarged many times, has a 13th-century porch, an early-18th-century tower, and a loggia dating from the 19th century; the building presently holds the Raccolta Comunale (paintings, sculpture, codices, goldwork). cola, or Tempietto (1354), an unusual design by Vanni Tuzi, is a small square building with semicircular arcading along two sides. The Castellina of Giacomo da Vignola, a rectangular fortress with corner bastions, was built (1554–63) over an ancient temple.

On the outskirts of the city stands a Renaissance church, Madonna delle Nevi (1565–71), with an octagonal exterior and a Greek-cross interior, frescoed by Camillo and Fabio Angelucci (1576–84). In nearby Valle Castoriana, a religious retreat in the Middle Ages, is the Abbey of S. Eutizio, with a Romanesque church (1190) by Maestro Pietro; within are significant works of Renaissance art.

Orvieto (anc. Salpinum, Volsinii Veteres?). The name "Urbs Vetus," derived from the "Ourbibentos" of Procopius of Caesarea (6th cent.), dates only from the early Middle Ages. Thereafter, as "Urbiventus," it was mentioned by Paulus Diaconus and in documents of Pope Gregory the Great. Because of its impregnable position atop an almost perpendicular cliff of volcanic tuff, the ancient city was never walled; the only access was from the west, at Porta Maggiore. Its *Capitolium* may perhaps lie under the present Palazzo del Popolo. The Tempio Augurale (or del Belvedere; probably 5th cent. B.C.), a minor temple with three cellae, lay outside the city proper. Traces of two other temples and many architectural terra cottas have come to light. Of great interest are the Etruscan necropolises with chamber tombs, at the base of the cliff at Crocifisso del Tufa and Cannicella.

The medieval city, built over the ancient site, did not achieve full development until the 12th century. The Church of S. Andrea, a Romanesque structure (11th–12th cent.; restored 16th and 20th cent.) that incorporates remains of a 6th-century church on Roman foundations, has a portico on the left flank and a massive dodecagonal campanile (12th cent., restored). S. Giovenale (11th–12th cent.) has a simple high altar dated 1170 and is adorned with 13th- and 14th-century frescoes. Toward the end of the 13th century, Gothic elements were introduced and initially blended with the prevailing Romanesque style: for example, in the imposing Palazzo del Popolo (PL. 186), which has triple-arched windows on the second story — reached by a broad exterior stairway — and a massive arcade, now partly walled up, on the ground level. The Palazzo dei Papi (or Soliano; 1297–1304) also has triple-arched windows and an outside staircase.

The Cathedral, one of the masterpieces of Italian Gothic architecture, was begun in 1290, probably by Fra Bevignate of Perugia; from about 1305 to 1330 its construction was carried on under Lorenzo Maitani, designer (?) of the façade (VI, PL. 333; IX, PL. 265) and much of the sculptural decoration (IX, PLS. 267–269). The side walls and the apse are faced with uniform white and black horizontal bands, an austere pattern that recurs on the walls within and on the piers. The deep presbytery has a stained-glass window (1325–34) and is decorated with frescoes by Ugolino di Prete Ilario, Pinturicchio, and Pastura (Antonio Massari da Viterbo). The arms of the transept end in two chapels: on the right, the Cappella Nuova (Madonna of S. Brizio), with vault frescoes by Fra Angelico and Benozzo Gozzoli (1447) and the celebrated fresco cycle of Luca Signorelli (IV, PL. 179; VII, PL. 380); on the left, the Chapel of the Corporal, containing a reliquary by Ugolino di Vieri (VI, PL. 382), a *Madonna of Mercy* attributed to Lippo Vanni (III, PL. 309), and frescoes by Ugolino di Prete Ilario and his pupils (1357–64). On the wall of the left aisle is a fresco of the Madonna by Gentile da Fabriano (1425). The Church of S. Domenico (13th cent.) has been greatly damaged, altered, and restored over the centuries; a Gothic portal transferred from another church was added in modern times. Within are the tombs by Arnolfo di Cambio (13th cent.; I, PLS. 456, 457) and Ippolito Scalza (late 16th cent.). The Petrucci Chapel was designed by Michele Sanmicheli. The Church of S. Francesco combines a Gothic façade with a baroque interior. S. Lorenzo in Arari (13th cent.) contains 14th-century frescoes and a 12th-century ciborium. During the Renaissance many medieval buildings were enlarged and renovated, among them the Palazzo Comunale (16th-century façade by Scalza), and work on the Cathedral was intensified, under Simone Mosca, Scalza, and Sanmicheli. New buildings were erected, including Palazzo Crispo (later Marsciano), designed by Antonio da Sangallo the Younger, and many of the houses on Via Cavour. Dating from the Renaissance are the 15th-century Palazzo Mancini (Ficarelli) and Palazzo Filippeschi (Petrangeli), as well as the following 16th-century palaces: Urbani (Petrucci; by Sanmicheli), Clementini (by Scalza), Gualterio (presently Banco di Roma; design by Mosca and portal by Scalza), Buzi and Saracinelli (Baiocchini; also by Scalza), Ceccantoni, and Caravajal-Simoncelli. The Oratory of S. Giovanni Decollato also dates from the 16th century. The Pozzo della Rocca (or di S. Patrizio; 1527–37), a peculiar example of engineering by Antonio da Sangallo the Younger, consists of a cylindrical shaft about 20 ft. deep pierced by 72 windows, with a double spiral staircase.

Two examples of the baroque are the Church of the Gesù, which has rich stucco decoration, and S. Bernardino, a convent church that has a façade decorated with volutes and a richly ornamented oval interior. The Church of S. Maria dei Servi, built in Gothic style in 1259 but remodeled in a neoclassic manner by Virginio Vespignani in the 19th century, contains a *Madonna and Child* by Coppo di Marcovaldo (PL. 183). Also noteworthy is the Teatro Civico Mancinelli, designed by Giovanni Santini and Vespignani and decorated by Cesare Fracassini (19th cent.). *Museums*: Museo Faina (Palazzo Faina), with an important collection of Greek vases; Museo dell'Opera del Duomo (Palazzo dei Papi), emphasizing Italian painting and sculpture in its galleries. The archaeological section is housed in the 17th-century Palazzo dell'Opera nearby.

On the outskirts is the Abbey (Badia) of SS. Severo e Martirio, which includes a 12th-century church and a dodecagonal campanile. There are Etruscan painted tombs in the vicinity: at Poggio dei Settecamini (or del Roccolo), the Golini tomb and the "Tomba delle Due Bighe," the frescoes of which have been removed to the Museo Archeologico in Florence; and near Castel Rubello, the still frescoed Tomb of the Hescanas.

Perugia (Lat., Perusia). One of the most important of the federated Etruscan cities, it is rich in artistic evidence of that period; however, its remote origins are probably Umbrian. An ally of Rome and later a municipium (after A.D. 90), it maintained its importance throughout the Empire and in the Middle Ages. In 1540 it passed to the Papal States, and thereafter declined. The ancient walls, surrounding the oldest quarter, follow an irregular course over the high ground (FIG. 655) and are of irregular *opus quadratum*. Although their Etruscan origin has been established, the date remains problematical (probably 4th–2d cent.). Six of the ancient gates still stand, including the so-called "Arch of Augustus" (erroneously named from the inscription "Augusta Perusia Colonia Vibia"). The arch is decorated with a Doric frieze and is flanked by two massive towers, one topped by a 16th-century loggia. The upper part of the Porta Marzia (V, PL. 48), another gate of Etruscan origin, surmounted by a blind loggia with sculptured figures (possibly Jupiter and the Dioscuri), was incorporated into the 16th-century Rocca Paolina. Etruscan and Roman necropolises are found in the surrounding country. A tomb type that seems characteristic of the Perugia region consists of a single chamber holding Hellenistic figured urns in travertine or terra cotta. Among the notable Etruscan monuments are three underground tombs: Villa Sperandio, where a sarcophagus with reliefs of an archaic Chiusi type was recovered; S. Manno, with a barrel-vaulted ceiling; and that of the Volumnii, carved into the rock in imitation of a house with rooms, reliefs, and urns (IV, PL. 454).

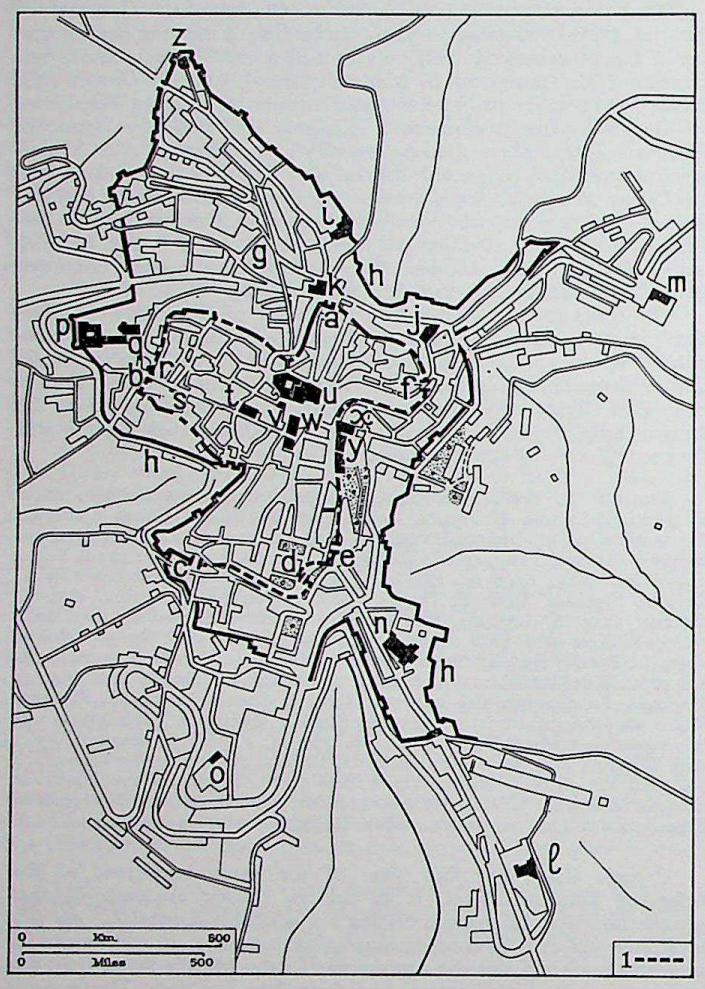
The appearance of the city is medieval. In the 14th century the walls were extended to enclose the S. Pietro and S. Angelo quarters. At the northern edge of the city is the Early Christian Church of S. Angelo (late 5th or early 6th cent., restored), circular in plan, with a circular ambulatory and 16 ancient Roman columns supporting the central drum. The Gothic portal dates from the 14th century, and the external buttresses from the 17th. The Church of S. Prospero, a small 10th-century structure with later additions, contains an 8th-century ciborium. S. Pietro (ca. 1000) has retained, almost intact, its original basilican structure, with aisles separated by two rows of 18 ancient columns with Ionic capitals. The decora-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

tion of the interior, including the coffered ceiling of the central aisle, is of the 15th and 16th centuries. The paintings are by Antonio Vasilacchi (Aliense), Bonifacio Veronese, Sassoferrato, Guercino, and Vasari, among others. The carved and inlaid wooden choir stalls and the wardrobes in the sacristy are 16th-century works; the sacristy also contains small paintings on wood by Perugino. The hexagonal campanile dates from the 15th century, the portico from the 17th.

Perugia has many Romanesque churches, most of which have been remodeled or altered at a later date: S. Ercolano, S. Francesco



Perugia, plan. *Key*: (1) Boundary of the ancient and early medieval city, with the course and remains of the Etruscan walls. Principal monuments: (*a*) So-called "Arch of Augustus"; (*b*) Porta S. Luca; (*c*) Porta della Mandorla: (*d*) remains of Rocca Paolina and Porta Marzia; (*e*) Porta S. Ercolano and Church of S. Ercolano; (*f*) Porta Sole; (*g*) area of the Roman baths; (*h*) walls, 13th–16th century; (i) S. Agostino; (*j*) S. Maria Nuova; (*k*) Palazzo Gallenga Stuart; (*l*) S. Pietro; (*m*) Church and Convent of S. Maria di Monteluce; (*n*) S. Domenico; (*o*) S. Giuliana; (*p*) Accademia di Belle Arti; (*q*) Churches of S. Francesco al Prato and S. Bernardino; (*r*) Church of the Madonna della Luce; (*s*) Sciri tower; (*t*) S. Filippo Neri; (*u*) Cathedral, Palazzo del Seminario, and Fontana Maggiore; (*v*) archiepiscopal palace; (*w*) Palazzo Comunale (or dei Priori) and Collegio del Cambio; (*x*) Church of the Gesù; (*y*) Palazzo del Capitano del Popolo and Palazzo dell'Università Vecchia; (*z*) S. Angelo.

al Prato, S. Maria Nuova (baroque interior; 17th-century campanile rebuilt from designs by Galeazzo Alessi), S. Agostino (18th-century interior; choir stalls and lectern of inlaid wood by Baccio d'Agnolo, 1502–32). S. Bevignate (late 13th cent.) marks the combination of early monastic Gothic influences with Romanesque elements. Gothic features are also seen in the following 13th-century churches: S. Giuliana, with 13th- and 14th-century frescoes, as well as remains of a 13th-century cloister and one of the 14th century in the former convent; S. Maria di Monteluce, remodeled in the 14th and 15th centuries, with a *Crucifixion* (ca. 1490; detached fresco) by Fiorenzo di Lorenzo; S. Maria della Valle; SS. Stefano e Valentino; S. Agata (remodeled), with a 15th-century polyptych of Lello da Velletri. The Cathedral (S. Lorenzo; 1345–1490) is a late Gothic *Hallenkirche*, with an exterior in rough masonry, for the marble facing was never completed. The façade is preceded by a wide flight of steps, atop which is the bronze statue of Pope Julius III by Vincenzo Danti (1555); the Renaissance portal is by Alessi (1568). The interior contains carved wooden choir stalls by Giuliano da Maiano and Domenico del Tasso (1486–91) and bas-reliefs by Agostino di Duccio and assistants. The Chapel of S. Bernardino contains a *Descent from the Cross* by Federico Barocci (1569); works of Cesare Nebbia (late 16th cent.) are in the Cappella del Sacramento. The lunette above the Altar of the Gonfalon is by Giannicola di Paolo, to whom the *Madonna delle Grazie* in the nave is attributed as well.

Secular architecture (12th–15th cent.): The Sciri house and the adjacent tower are probably of the 12th century. The Gothic Palazzo Comunale (or dei Priori; 1293–1443) has a large fan-shaped stairway leading to a portal surmounted by a griffin and a Guelph lion in bronze, the two symbols of the city. On the side facing Corso Vannucci is a richly ornamented portal, with a round arch and lunette sculpture (ca. 1340). There are two bands of triple-arched windows, and the whole is surmounted by a battlemented cornice. The Hall of the Notaries (formerly the council chamber), a huge arched room on the second floor, is decorated with frescoes of the school of Cavallini (1297); on the same floor is the Cappella dei Priori, with frescoes by Benedetto Bonfigli (1454–96). The Fontana Maggiore (X, PLS. 324, 325), in the square between the Palazzo Comunale and the Cathedral, is by Nicola and Giovanni Pisano (late 13th cent., restored). It consists of two concentric polygonal basins, on two levels, and is surmounted by a circular bronze bowl with three nymphs supporting a wreath. Among the many residences and towers of this period are the Baglioni houses, once incorporated in the Rocca Paolina but since freed from the ruins of the fortress.

Monuments of the early Renaissance period include Porta S. Pietro (begun 1447), with major work by Agostino di Duccio (1475, unfinished); the battlemented Porta S. Angelo (14th cent., restored); several large palaces; the loggias of Braccio Fortebraccio (1423), by the Bolognese Fioravante di Rodolfo Fioravanti, and of Baldo degli Ubaldi (15th cent.); Palazzo dell'Università Vecchia (1453–83); Palazzo del Capitano del Popolo (1472–81), with decorations probably by Lombard masters; and the former Dominican monastery. Of the same period, but still Gothic in form, are the remaining portal and mullioned windows of the Collegio dei Notari (1446) and the Sala del Collegio della Mercanzia (first half of 15th cent.), with its splendid late Gothic ornamentation. The Collegio del Cambio (1452–57) is Renaissance in form; some of its halls were frescoed by Perugino and his pupils (1496–1500; XI, PLS. 114, 116). It also contains fine carved and inlaid woodwork by Domenico del Tasso (1492) and Antonio da Mercatello (1508). The Oratory of S. Bernardino (1457–61), a work of Agostino di Duccio, has a polychrome façade elaborately decorated with sculpture in niches and reliefs (PL. 191). High Renaissance architecture of the 16th century is represented in the Church of the Gesú (partly rebuilt in the present century), with frescoes by Andrea Carlone and a carved ceiling; S. Maria del Popolo, by Galeazzo Alessi; the small churches of S. Angelo della Pace (by Alessi), Madonna della Luce, Maestà delle Volte (by V. Martelli, with frescoes by Niccolò Pomarancio); and the loggia of the left tower of the Arch of Augustus. The Rocca Paolina (largely destroyed in the revolution of 1848) was built by Antonio da Sangallo the Younger for Pope Paul III in 1540. The archiepiscopal palace retains parts of a 14th-century building and the earlier Palazzo del Podestà in its façade and side wall. The Church of S. Domenico, originally 14th-century Gothic, was rebuilt by Carlo Maderno in 1632; it is three-aisled and has altar decorations by Agostino di Duccio and Gothic stained-glass windows.

Baroque buildings of the 17th and 18th centuries that are prominent include: S. Filippo Neri, with frescoes by Andrea Carlone and Francesco Appiani; Church of S. Teresa (or degli Scalzi); Palazzo Gallenga Stuart, by P. Carattoli (the present-day Università per Stranieri); Palazzo Donini, also by Carattoli; the Convent and Church of the Olivetani, the seat of the modern university, designed by L. Vanvitelli; S. Severo, with paintings by Raphael and Perugino; and Teatro Morlacchi. Of 19th-century origin are Palazzo del Governo (by A. Arienti); Teatro del Pavone, decorated by Benvenuti; Palazzo della Banca d'Italia, in Neo-Renaissance style, by G. Rossi; Palazzo Cesaroni, by G. Calderini; and the monument to Victor Emmanuel II, by G. Tadolini.

Museums: Galleria Nazionale dell'Umbria (Palazzo dei Priori), containing important collections of painting and sculpture; Museo dell'Opera del Duomo (Palazzo dei Canonici), with religious objects and paintings; Musei Civici (former Convento di S. Domenico); in the Palazzone locality, Museo dell'Ipogeo dei Volumni (Etruscan tomb art); Istituto d'Arte and Accademia di Belle Arti.

Spello (Lat., Hispellum). Perhaps of Umbrian origin, in 41 B.C. it became a Roman colonia of some importance. The walls, probably from the Augustan period, had a number of gates, of which the Porta Venere (with three supporting arches and two towers) and the Porta Consolare are best preserved. There are also portions of a large amphitheater and of a theater. The principal monuments, nearly all medieval, are on the main street, which runs the full breadth of the town, with narrow and twisting streets branching off, many of them spanned by arches. S. Maria Maggiore (12th–13th cent., altered greatly in the 17th cent.) contains frescoes by Pinturicchio in the Baglioni Chapel. S. Lorenzo was built in the 12th century, but the façade was remodeled in 1540; the neoclassic Cappella del Sacramento within was built by Neri di Foligno, after a design by Giuseppe Piermarini (1793). In the Church of S. Andrea (13th cent.) is a large altar frontal, *Madonna and Child with Saints*, by Pinturicchio and Eusebio da San Giorgio (1508). The Villa Fidelia (or Costanzi) is a suburban neoclassic residence of the 18th century. The museum of S. Maria Maggiore is in the Cappella del Sepolcro.

Spoleto (Lat., Spoletium). An Umbrian settlement that became a Latin colonia in 241 B.C., Spoletium was destroyed by Sulla in the 1st century B.C., but grew again in size and wealth under Augustus and during the late Empire. Destroyed by Totila in the 6th century, it was rebuilt by Narses in 552. In 571 Spoleto became the seat of a powerful Lombard duchy, and in 776 it came under Frankish rule. In the late 12th century it became part of the Papal States.

The Umbrian walls of polygonal masonry, possibly raised in the 5th century B.C., were restored in Roman times. The ancient acropolis was on the hill of Sant'Elia. There are numerous Roman remains, and the Roman network of streets is still in evidence. In the forum (the modern Piazza del Mercato) are the Arch of Drusus and Germanicus (1st cent.), a 1st-century temple with tetrastyle pronaos (Church of S. Ansano), and scant remains of the *capitolium*. There are a theater (reign of Augustus) and an amphitheater (2d cent.).

The present-day city retains its medieval aspect, dominated by the Rocca, a fortress erected in the early 14th century and enlarged in the 15th. S. Salvatore (late 4th–6th cent., several times restored), a basilica beyond the walls, is three-aisled and triapsidal and has a façade with three portals and three windows, decorated with sculpture in a classical manner that reveals probable Oriental influence (I, PL. 416). The above-mentioned S. Ansano, a small church built over the ruins of a Roman temple in the 11th and 12th centuries, retains a crypt (possibly 7th cent.), with frescoes in a Byzantine manner from a later period. S. Eufemia (probably 10th cent., restored), basilican in plan, has alternating columns and piers inside, three apses, and galleries. Churches of the Romanesque period are well represented. SS. Giovanni e Paolo, an 11th-century construction, contains frescoes of the 12th and 13th centuries. S. Paolo Intervineas is also decorated with frescoes of that date. S. Gregorio Maggiore was begun in the late 11th century but has been rebuilt in the present century. Its massive campanile is Romanesque, its portico Renaissance. The interior has a raised presbytery over a crypt divided into five aisles, with frescoes of the 12th to 15th century. S. Pietro (PL. 176), outside the city walls, is a 13th-century structure probably raised over the ruins of a 5th-century church. The façade, decorated with 12th-century reliefs, is from the original; the interior was remodeled in the 18th century. The most important of the Romanesque buildings is the Cathedral. In spite of additions (15th-cent. portico) and the remodeling of the interior in the 17th century, it has retained the massive lines of the original structure. The façade, divided horizontally into three bands, has a large rose window framed with sculpture on the second level and mosaics (1207) in a Byzantine manner above. In the interior are a painted crucifix by Alberto Sotio (PL. 177), a cycle of frescoes in the apse (scenes from the life of the Virgin) by Filippo Lippi (1467–69; IX, PL. 146), frescoes by Pinturicchio, and paintings by Pinturicchio and Annibale Carracci. The earliest Gothic architecture is found in S. Domenico (13th cent.) and, outside the city, in the Ponte delle Torri (second half of 14th cent.), probably designed by Matteo Gattapone. Of S. Nicolò (1304), which was destroyed by fire, only the original polygonal apse has survived. The Palazzo Comunale was built in the 13th century, but only the tower of the original remains; the rest was rebuilt in the late 18th century. The Palazzo Cecili-Pompili and the Torre dell'Olio are medieval (12th–14th cent.).

Significant Renaissance architecture includes the Casa dell'Opera del Duomo (1419); Tempietto della Manna d'Oro (1527), in the style of Bramante and with works by Sebastiano Conca; Church of the Madonna di Loreto (1572), with decorations by Giovanni Baglione; and Palazzo Arroni (15th–16th cent.), with graffiti probably executed from designs by Lo Spagna. From the 17th century are S. Filippo (ca. 1650), with works by Conca; the Ancaiani and Mauri palaces; and the great fountain in the Piazza del Mercato. The Teatro Nuovo, by Ireneo Aleandri, and the Teatro Caio Melisso, originally a baroque edifice (rebuilt ca. 1875–80; restored 1958), exemplify 19th-century architecture of the city. *Museums*: Pinacoteca Civica (Palazzo Comunale); Museo Civico (Palazzo della Signoria), containing the Lex Spoletina of the 3d century B.C.; Galleria Comunale di Arte Moderna (Palazzo Collicola).

Near Sant'Anatolia di Narco is the Romanesque Church of S. Felice (late 12th cent.), its façade ornamented with a rose window and sculpture. Farther south, near the source of the Clitunno, is Fonti del Clitunno, with a small temple dedicated in antiquity to the personification of the river and a 5th-century Christian shrine (perhaps 8th-cent.), containing the oldest frescoes in Umbria (7th–8th cent.).

Terni (Lat., Interamna Nahars). Situated on a plain in the Nera Valley, Terni was inhabited in the Iron Age (nearby necropolises), later was a town of the Umbri, and then became a Roman municipium. The regular layout of the Roman city is clearly distinguishable. There are remains of the Roman walls, an amphitheater (A.D. 32), and a theater. Under the Church of S. Salvatore are vestiges of Roman structures, and on the outskirts of the city is an Early Christian cemetery. The town was destroyed by Christian of Mainz in 1174 but was rebuilt and repeatedly changed hands between the Church and the Empire. The city was badly damaged during World War II, and subsequent reconstruction has given it a predominantly modern appearance, in spite of many ancient and medieval monuments.

The Church of S. Salvatore dates from an Early Christian con-

struction of the 5th century, incorporating a Roman temple. Its circular presbytery and 12th-century nave contain traces of frescoes of the 13th and 14th centuries. The Cathedral (rebuilt 1653) was originally Romanesque, and from that period the central portal of the façade and the crypt have survived. Gothic churches include S. Francesco (1265, enlarged and several times restored), with the Paradisi Chapel, containing 15th-century frescoes possibly by Bartolomeo di Tommaso; S. Pietro (14th cent., restored); and S. Lorenzo (13th cent., enlarged 17th cent.). Secular architecture of the 14th and 15th centuries is represented by the Palazzo Mazzancolli and the tower and houses named for the Castelli family. Dating from the Renaissance are the Pierfelici, Spada (by Antonio da Sangallo the Younger), Gazzoli (late 16th cent.), Morelli, Mastrozzi-Magroni, and Bianchini-Riccardi palaces, as well as the courtyard of the Palazzo Alberici. The Palazzo Fabrizi is a 17th-century residence. The Teatro Comunale was designed by L. Poletti in the 19th century. The fountains in Piazza del Duomo (by C. Vigni) and Piazza Tacito, by M. Ridolfi and L. Fagiolo (1936; with mosaics by C. Cagli), and the Palazzo della Prefettura of C. Baggiano (1936) are noteworthy modern constructions. The Museo e Pinacoteca Civica is in the Palazzo Carrara.

In the neighboring countryside, near Ferentillo, is the Abbey of S. Pietro in Valle, founded in the 8th century. The three apses, the transept, and part of the marble ornamentation belong to the original structure; the cloister and the upper part of the campanile date from the 12th century. The frescoes in the church are of the Roman school (12th cent.).

Todi (Lat., Tuder). Town probably of Umbrian origin, but subject to strong Etruscan influence. After 90 B.C. it became a Roman municipium, and during the reign of Augustus a military colonia was established. In the Middle Ages it was a prosperous commune, reaching its peak size in the 13th century. From the Umbrian-Etruscan period are the earliest city walls (partly rebuilt, 1st cent.); and within the city, remains of Etrusco-Italic temples have come to light. The so-called "Mars of Todi" (V, PL. 44) was found in one of these. The Roman period is evidenced by the Mercato Vecchio and vestiges of a theater and amphitheater.

The medieval city was built on the site of the Roman city, but in the 13th century it expanded markedly, and a third course of walls, with towers, was built; this still delimits the city. At the highest point is the Rocca, a ruined fortress. In the center of the city is Piazza del Popolo, until the 16th century entered by four gates. Fronting on it are the Cathedral, begun in the 12th century on Romanesque lines but completed with Gothic additions; Palazzo del Popolo, begun in 1213; and Palazzo del Capitano and Palazzo dei Priori, both late-13th-century edifices, the latter of which was altered in the 16th century. The Church of S. Fortunato (begun 1292) is a three-aisled Gothic hall church; it is preceded by a long flight of steps. The uncompleted façade was undertaken in the 15th century. Within is a *Madonna and Child with Two Angels* by Masolino. S. Ilario, with frescoes by Lo Spagna, and S. Maria in Camuccia are 13th-century churches. S. Maria delle Grazie, built in the mid-15th century, was later remodeled and dedicated to S. Filippo Neri. S. Maria della Consolazione (PL. 206), begun in 1508 and completed in 1607, is a Greek cross with a high dome on a drum in the style of Bramante, designed and built by Cola da Caprarola, Rocco da Vicenza, Ambrogio da Milano, Valentino Martelli, and Ippolito Scalza. The Chiesa del Crocifisso (late 16th cent.), also a Greek cross in plan, was designed by G. D. Bianchi and built by Scalza. The Palazzo Atti was built in 1552. The Palazzo del Seminario has a portal and a courtyard designed by Giacomo da Vignola (16th cent.). The Teatro Comunale was designed by Carlo Gatteschi in the 19th century. *Museums*: Museo e Pinacoteca Civica (Palazzo del Popolo); Museo del Duomo.

Bibliog. A. Alinari, Avanzi di una antica chiesa in Todi, RACr, XIV, 1937, pp. 361–66; G. Becatti, Forma Italiae, Regio VI: Tuder-Carsulae, Rome, 1938; O. Trevi (Lat., Trebiae). The Roman municipium was located below the site of the present town; the transfer of the inhabitants to higher ground occurred during the late Roman Empire. Latin inscriptions and vestiges of Roman edifices have been found at the ancient site. Nearly all the medieval buildings have been remodeled, including the churches of S. Emiliano (12th cent.) and S. Francesco (13th cent.). S. Martino (14th cent.), a Minorite church outside the town, contains frescoes by Lo Spagna and Tiberio d'Assisi. S. Maria di Pietrarossa (14th cent.) is built of salvaged Roman material and has paintings of the Umbrian school of the 15th and 16th centuries. The Palazzo Comunale (14th cent.) retains the portico on the ground floor and the tower of the original construction. The Church of the Madonna delle Lacrime (1487), by Antonio Marchisi, has a portal and sculpture by Gianpietro da Venezia (1495). The single-aisled interior contains works by Lo Spagna and Perugino. The Palazzo della Porta has frescoes by the Zuccaris (16th cent.). The Pinacoteca Comunale is in the Palazzo Comunale.

The Marches (It., Marche). This region, corresponding for the most part to ancient Picenum, contains fairly extensive evidence of Bronze Age cultures (ceramics) and of the Piceni (an Italic people) and Cisalpine Gallic (Celtic) tribes, who produced excellent bronze artifacts, jewels (especially amber), fibulae, pottery, and weapons. There are also traces of Greek influence. Roman and Early Christian remains are few. In the early Middle Ages close ties with the exarchate of Ravenna (the Pentapolis) and with the Church favored the maintenance of long-standing Byzantine traditions. Close relations also existed with Venice, and in the later Middle Ages the art of the region was characterized by Lombard and Venetian influences, as well as provincial elements from the Abruzzi. In the Renaissance, Tuscan influence was strong, especially at the court of Urbino.

Ancona (Ἀγχών; Lat., Ancona). The town is mainly modern in appearance; nevertheless, despite great devastation both in earlier times and during World War II, there remain noteworthy monuments and other vestiges of the early Villanovan and Picenian cultures. In the 4th century B.C. Ancona was a colony of Syracuse and after the Social War became a Roman municipium. In the early years of the 2d century Trajan built a new port on the site. From the 10th to the 12th century, the city was a prosperous maritime republic.

From the Greek period there are traces of an acropolis and of a temple of Aphrodite, located under the Cathedral. The most notable Roman monuments are the Arch of Trajan (built by Apollo-

dorus of Damascus), an amphitheater (erected in the reign of Augustus and rebuilt under Hadrian), and sections of wall in *opus quadratum*. From Early Christian and pre-Romanesque times, Ancona has the most important remains in the region. These include a Roman sarcophagus, a 7th-century ambo (now in S. Maria della Misericordia), and a 7th-century mosaic pavement below S. Maria della Piazza. The Cathedral (S. Ciriaco) dates from the 11th–13th century, though built over an older basilica (S. Lorenzo, 4th–6th cent.). The portal, of white and red marble, is recessed under a cusped Gothic vestibule. The plan is a Greek cross, with a polygonal dome on a drum showing Byzantine influence blended with early Gothic elements. The interior has a nave and side aisles, continued into the apsidal arms of the transept. Venetian influence is seen in the carinated ceiling (14th–15th cent.), and there are two 12th-century screens with inlaid reliefs. S. Maria della Piazza, built in the 12th century over an older church, has a façade (PL. 176) derived from the Cathedral of Zara. The interior contains a *Madonna and Saints* by Lorenzo Lotto. Also of the Romanesque period are the portal of S. Anna and the façades of S. Pietro and of the Palazzo del Senato (remodeled at a later date, but restored 1952). Of the 14th and 15th centuries, in Gothic or late Gothic forms, are S. Maria della Misericordia (1399) and the Palazzo Farina. The Loggia dei Mercanti (X, PL. 440), the portal of S. Francesco delle Scale, and the portal of the former Church of S. Agostino (1460) were designed by Giorgio da Sebenico (Orsini). The Palazzo del Governo (degli Anziani; remodeled a number of times) was probably in part designed by Francesco di Giorgio Martini, with a courtyard built in 1493; an entrance portico by Pietro Amoroso (1470) is in Renaissance style. The Palazzo Giovanelli Benincasa, also Renaissance, has a façade by Giorgio da Sebenico (1446–48). The Church of the Sacrament was built in 1538, but its interior was remodeled in the 18th century. The Palazzo Ferretti (1540) is attributed to Pellegrino Tibaldi; the balcony was added by Luigi Vanvitelli (18th cent.). The interior contains frescoes by Tibaldi and the Zuccaris. Also attributed to Tibaldi is the Fontana del Calamo (1560).

In the 18th century many structures were designed in the neoclassic style of Vanvitelli; these include the Porta Pia (1787–89) and the Arco Clementino (Vanvitelli; 1738). The Lazzaretto (1733), also built by Vanvitelli, is in the form of a pentagon isolated by a ring of canals connected with the main basin of the old harbor. S. Domenico (1763–88), designed by Carlo Marchionni, contains a *Crucifixion* by Titian. The façade of the Gesù was designed by Vanvitelli (1743). The interior holds works by Sebastiano Conca and Orazio Gentileschi. Of the buildings erected since 1945, the most interesting is the complex of pavilions for the Fiera della Pesca. *Museums*: Museo Nazionale delle Marche (Palazzo Ferretti), with prehistoric and archaeological material; Pinacoteca "Francesco Podesti" (Palazzo degli Anziani); Museo Diocesano.

Ascoli Piceno (Lat., Asculum). At the confluence of the Tronto and Castellano rivers, the site has been inhabited since the Iron Age. Under the Romans it became a colonia in 286 B.C.; in the Middle Ages it was a free commune and thereafter passed into the possession of the Church (1502). Of the Roman period are the late republican Porta "Gemina," with a double archway over the Via Salaria; the bridge over the Tronto, a temple, and a theater are Augustan constructions. The city walls were rebuilt in the Middle Ages. Many Romanesque buildings remain from the period of the commune (1185–1242). Influences from Umbria and the Abruzzi are evident in the façades of many churches, including SS. Vincenzo e Anastasio (12th–14th cent.); S. Tomaso (13th cent.), with frescoes of the 14th century; S. Venanzio; S. Angelo Magno (1292), with works by Cola dell'Amatrice; S. Vittore (12th–13th cent.), with frescoes of the 14th and 15th centuries; and S. Pietro in Castello (13th–14th cent.). The octagonal Baptistery (12th cent.) is in Lombard Romanesque style. The exterior terminates in a series of blind arches, and the interior has a spherical vault. Romanesque secular architecture is represented in numerous houses, towers, and portals of the medieval quarters. Noteworthy among these are the Torre Ercolani (12th cent.) and the Casa Longobarda, of ashlar masonry (probably 12th cent.).

Gothic buildings are numerous. S. Francesco, begun in the second half of the 13th century and based on a design after the Cathedral of Siena, was not completed until the 16th century. Its most striking feature is the posterior, comprising seven apses (three on the nave and two on each arm of the transept). The interior has a nave and side aisles, separated by Gothic arches on octagonal piers, and two triforia. S. Pietro Martire (1332) has a 17th-century façade by Giuseppe Giosafatti. S. Agostino, built between 1317 and 1485, contains paintings by Francescuccio Ghissi, Cola dell'Amatrice, and Bacciccio. S. Giacomo dates from the 13th–15th century. The Malatesta fortress was built in 1348 and was enlarged by Antonio da Sangallo the Younger in the 16th century. The Ponte Maggiore dates from 1373.

The Renaissance witnessed a great burst of building activity in Ascoli, and many houses and palaces from this period are found in various quarters. The Piazza del Popolo is surrounded by 16th-century arcades, the Loggia dei Mercanti (early 16th cent., begun by Bernardino da Carona), and the Palazzo del Popolo. Originally a 13th-century building, the tower of which still stands, the palace was rebuilt during the Renaissance, with a portal by Cola dell'Amatrice and a courtyard with a double loggia. The Piazzetta di S. Pietro Martire is also Renaissance, as are many houses on the Corso Mazzini, including Palazzo Malaspina, with an unusual 16th-century loggia attributed to Cola dell'Amatrice. Some of the most important buildings in the city face the Piazza Arringo: the episcopal palace (16th cent.), as well as Palazzo Comunale and Palazzo dell'Arringo, 12th- and 13th-century structures joined in 1683 with a baroque façade by Giuseppe Giosafatti. On the same square is the Cathedral, originally of the 13th century or possibly even older, rebuilt in 1482. The façade, attributed to Cola dell'Amatrice, was begun in 1532 but remained unfinished. The interior (remodeled) has a nave and side aisles and octagonal piers; the presbytery is over a crypt. Within the Cathedral are a polyptych by Carlo Crivelli (1475) and a number of precious sacred furnishings. The Casa Bonaparte (1507) is probably the work of Lombard builders. The Pia fortress, on Colle dell'Annunziata, was reconstructed by Pius IV in 1564. Among the more notable buildings of later periods are the Palazzo del Seminario (1603, F. Morelli); the Church of the Carmine (1651), with a façade by C. Rainaldi; the Chiesa dell'Angelo Custode (1679), also with a façade by Rainaldi; the Palazzo della Cassa di Risparmio, by Cesare Bazzani; and the Teatro Ventidio Basso (1841–46) by Ireneo Aleandri. *Museums*: Museo Civico; Pinacoteca Civica (Palazzo Comunale).

Cagli (Lat., ad Cale, Callium). Umbrian site which yielded a rich cache of bronze artifacts. Almost totally destroyed during a civil war in 1287, it was rebuilt on a regular checkerboard plan in 1289. It retains this 13th-century plan and, in part, the appearance of a small medieval borough. The churches of S. Francesco (1234–40) and S. Domenico are Romanesque with some Gothic elements. S. Angelo (14th cent.) is Gothic. The Cathedral, begun in 1424, has a portal by Antonio di Cristoforo da Fossombrone; the portico

on the left side belonged to the original structure. The Palazzo Comunale, dating from the 14th century, was remodeled by Francesco di Giorgio Martini, who also designed the Rocca, a fortress of which only the tower still stands. The town has many baroque buildings.

Chiaravalle di Castagnola. The modern village grew up from the 16th century around the Abbey of Chiaravalle (S. Maria in Castagnola), probably founded in the 12th century. The abbey church (VI, pl. 331) is one of the oldest examples of Cistercian Gothic architecture in Italy. The cloister and monastery date from the 16th century.

Fraccaro de Longhi, L'architettura delle chiese cistercensi italiane, Milano, 1958, pp. 217–31.

Chiaravalle di Fiastra. This abbey, one of the earliest Cistercian buildings in Italy, was founded at the end of the 12th century and completed in the 13th century (restored). The church plan is a Latin cross, with an interior narthex, nave and side aisles, and a rectangular apse flanked by four chapels and lit by a rose window. The adjacent cloister is of the 14th–15th century.

Fabriano. An extensive necropolis of the Piceni is evidence of an Iron Age settlement on this site. The present city arose from the union of two neighboring castles within a single wall in the 13th century. The center of the town has a monumental fountain (1351), the battlemented Palazzo del Podestà (1255, restored), Palazzo Comunale (17th-cent. façade), the clock tower, the episcopal palace (16th–18th cent.), and the Loggia of S. Francesco (completed late 17th cent.). There are a number of Gothic churches, remodeled to a greater or lesser extent. S. Nicolò (13th cent.), remodeled in the 14th and again in the 17th century, contains works by Guercino, Giacinto Brandi, and others. S. Lucia retains the left wall, apse, and campanile of the Gothic structure (14th–15th cent.); the single-aisled interior (18th cent.) contains works by Francescuccio Ghissi and Orazio Gentileschi, as well as frescoes by Allegretto Nuzi and his school. The Cathedral has a 14th–century polygonal apse in its original form and is decorated with frescoes by Nuzi. SS. Biagio e Romualdo dates from the 13th century (remodeled 1748), while the adjoining cloister is of the 16th century. S. Agostino retains only the 13th-century portal; its interior dates from the 18th century. The Hospital of S. Maria del Buon Gesù, built in 1456, is in a transitional Gothic-Renaissance style. S. Benedetto (begun 1290; rebuilt 16th and 18th cent.) has a baroque interior containing works by Gentileschi, Brandi, and Francesco Vanni. The Oratorio del Gonfalone was built in 1610–36, and its gilt wooden ceiling completed in 1643. *Museums*: Pinacoteca Civica and Museo degli Arazzi, both in the bishop's palace.

Fano (Lat., Fanum Fortunae). At the point where the Via Flaminia reaches the Adriatic coast, the settlement grew up about a temple of Fortune, of which no trace remains. Under Augustus Fanum became a colonia. Destroyed by the Goths in the 5th century, it was rebuilt by Belisarius in the 6th century and became the seat of the Maritime Pentapolis. The Roman street plan can still be discerned. Of the Augustan Era are sections of the walls and the Arch of Augustus (also the gate of the Roman city), with three vaults. Remains of a basilica may mark that built and described by Vitruvius (1st cent. B.C.). The Cathedral was raised over an older structure in the 12th century but was later remodeled. The Nolfi Chapel is decorated with frescoes of scenes from the life of the Virgin by Domenichino. S. Agostino, built in 1200 over remains of a Roman construction, has been remodeled and restored; it preserves works by Guercino (III, pl. 311) and others. The Palazzo della Ragione is dated 1299, with the tower rebuilt by Luigi Vanvitelli (18th cent.). S. Domenico (1300) contains frescoes by artists from Rimini and Umbria.

Under the rule of the Malatestas (mid-14th to mid-15th cent.) the city underwent remarkable development. The Malatesta palace was built in 1413–21 and enlarged in the 16th century. The Rocca Malatestiana (fortress), designed by Matteo Nuti, was completed in 1452). The Gothic Church of S. Francesco contains two monumental tombs of the Malatestas in the portico. One is late Gothic (ca. 1400), designed by a follower of Pier Paolo Dalle Masegne; the other is of the Renaissance, in the manner of Alberti. The Logge di S. Michele were built in the 15th century. Between the Malatesta palace and Palazzo della Ragione is an arch in the manner of Bramante (1491). S. Maria Nuova (rebuilt 1500) contains a *Madonna and Child with Saints* and an *Annunciation* by Perugino and a *Visitation* by Giovanni Santi. S. Michele has a façade of 1504, with portal by Bernardino di Pietro da Carona (1511–13). S. Paterniano (ca. 1550) may have been built from designs by Jacopo Sansovino; the cloister is also of the 16th century. The Madonna dei Piattelletti has a portal dated 1480. S. Pietro in Valle is baroque; begun in 1610–13, it was not completed until 1696. Within is an *Annunciation* by Guido Reni. The Museo Malatestiano is in the Malatesta palace.

Fermo (Lat., Firmum Picenum). Originally a settlement of the Piceni, Firmum became a Roman colonia in 264 B.C. and later a municipium. In the Middle Ages the town was the seat of a marquisate. Destroyed in 1176 by Frederick Barbarossa, it was rebuilt on a radial plan. There are remains of pre-Roman, republican, and Augustan city walls. Also Roman are portions of a large filtering reservoir, a theater built during the reign of Claudius (1st cent.), and vestiges of harbor works at Castellum Firmanorum. The oldest Christian relic is a 4th-century sarcophagus in the Cathedral crypt. From the Romanesque period, only the Church of S. Zenone (1171), with a figured portal (1186), and the crude portal in the apse of S. Pietro (1261) remain. The Cathedral, Romanesque and in part Gothic, was founded in 1227 on the site of an Early Christian basilica (remnants of 5th-century mosaic pavement near the presbytery) and of a subsequent 10th-century edifice, probably destroyed in 1176. The façade, the base of the campanile, and part of the right wall have survived from the 13th-century structure, designed by Giorgio di Como. The interior (remodeled by Cosimo Morelli, 1789) has a tabernacle by Girolamo and Ludovico Lombardo (1571).

There are several noteworthy churches of the Gothic period, for the most part remodeled: S. Domenico (begun 1233); S. Francesco (1240), with façade rebuilt in the 18th century, but with the original 13th-century portal and 15th-century froescoes within; and S. Filippo, its 17th-century interior holding a *Nativity* of Peter Paul Rubens and a *Pentecost* by Giovanni Lanfranco. The Palazzo Fogliani and the Monte di Pietà (with late Gothic portal) are of the 15th century, and the Palazzo Azzolino of the 16th. The Church of the Pietà was designed by Pellegrino Tibaldi (16th cent.). The Palazzo Vitali Rosati also dates from the 16th century. The Piazza del Popolo is flanked by the Palazzo Comunale (rebuilt 1446), with a portico (mid-16th cent.)

Iesi (Lat., Aesis). Possibly a settlement of the Umbri, Aesis became a Roman colonia in 247 B.C. and a commune in the 11th century. In the 13th–15th century Iesi was subject to various overlords until it passed to the Papal States. The city plan is somewhat complex, having two separate nuclei. The lower sector, on the southeast, is modern; above is the older part, set within 14th-century walls that have retained, almost intact, their medieval defenses. S. Marco (13th cent.) is Gothic, its interior decorated with frescoes by artists from Rimini. The Palazzo della Signoria (1486–98), designed by Francesco di Giorgio Martini, houses a library, museums, and painting gallery (works by Lorenzo Lotto and local artists). Its spacious courtyard, with porticoes and loggias, was designed by Andrea Sansovino; the tower was rebuilt in the 17th century. The Cathedral was built in 1732–41 over an older Gothic church, and its façade was added in the late 19th century. S. Giovanni Battista is 17th-century.

Loreto. The town grew up in the 13th century around the Holy House (legendary home of the Virgin miraculously transported to Loreto) and was raised to the rank of city in 1586 by Pope Sixtus V. The girdle walls were built by C. Resse early in the 16th century, after plans by Antonio da Sangallo and Andrea Sansovino, and enlarged with bulwarks in the 17th century. The Sanctuary of the Holy House was begun in 1468 in a transitional Gothic-Renaissance style, under the direction of the Venetian architect Marino di Marco Cedino; it was continued, after 1476, along Renaissance lines by Giuliano da Maiano. Thereafter it was enlarged and work was carried on by Baccio Pontelli, who built the apse, and by Giuliano da Sangallo (1498–1500), who designed the dome. The original project was then modified by Bramante (1509–11), Andrea Sansovino (1513–26), and Antonio da Sangallo the Younger (1531–35). The façade, completed in 1587, has three portals with bronze doors in relief. The campanile was built by Luigi Vanvitelli in 1750–54. The interior of the sanctuary is Gothic, with nave and side aisles and three apses, triapsidal transepts, and cross-vaulted ceilings. The monochrome frescoes of Luca Signorelli in the nave were later repainted. In the Sacristy of S. Marco are frescoes by Melozzo da Forlì (PL. 204) and Marco Palmezzano. The Sacristy of S. Giovanni contains other notable frescoes by Signorelli. The baptismal font is by Tiburzio Vergelli and pupils (1600–07). The Holy House itself, directly below the dome, is faced with architectural elements and reliefs executed under the direction of Gian Cristoforo Romano, Andrea Sansovino, and Raniero Nerucci, with other sculpture by Baccio Bandinelli, Raffaello da Montelupo, Andrea Sansovino (*Annunciation, Nativity, Adoration of the Sheperds*), Niccolò Tribolo, and Francesco da Sangallo. On two sides of the piazza fronting the sanctuary is the Palazzo Apostolico, with two ranges of arcades, begun by Bramante, continued by Antonio da Sangallo the Younger, Andrea Sansovino, Raniero Nerucci, and Giovanni Boccalini, and completed in the 18th century by Vanvitelli. Inside is a museum devoted to the Holy House. The statue of Sixtus V in the square is by Antonio Calcagni and Vergelli, the fountain (early 17th cent.) by Carlo Maderno and Giovanni Fontana. Other monuments of the city include the Fontana dei Galli, with bronzework by Tarquinio and Pier Paolo Jacometti (17th cent.), and the Porta Romana by Pompeo Floriani.

Macerata. Despite its over-all modern appearance, Macerata is rich in monuments of various periods and styles. The city, founded in 1138 by the fusion of the ancient borough of Poggio San Giuliano with the Castle of Macerata, has in turn belonged to the Church and various overlords. From the Middle Ages, there remain parts of the 14th-century walls; the Church of S. Maria della Porta, a late Romanesque structure, with a portal dated about 1340 and a lower church of the 11th century; and the battlemented Porta Montana (14th cent.). To the Renaissance belong the Loggia dei Mercanti, possibly designed by Cassiano da Fabriano; the Palazzo del Governo, built in the 16th century, incorporating parts of a 14th-century structure; the Torre Maggiore of Galasso Alghisi, erected in 1558; and S. Maria delle Vergini, in the form of a domed Greek cross, also by Alghisi (1550). Among the 16th-century palaces are Palazzo Ferri, Palazzo Aurista, and Palazzo Mignardi, of diamond-shaped ashlar masonry and with a portal attributed to Rocco da Vicenza. The 18th century, until the occupation by the French in 1807, witnessed a very active building period in the city. The Cathedral was built in 1771–90 by Cosimo Morelli, who retained the campanile from the preceding 15th-century church. Morelli also built the Church of S. Giorgio (1792). S. Giovanni (1721) is by Rosato Rosati. The Palazzo Santafiora was built in 1773. The Teatro Lauro Rossi was built from plans (1767) by Francesco Galli Bibiena, with modifications by Morelli. The interior remodeling of the 15th-century Church of the Madonna della Misericordia was the work of Luigi Vanvitelli (1742). The Sferisterio (1821–29), a playing field with a neoclassic peristyle and wide stairs, is by Ireneo Aleandri. The Pinacoteca e Museo Civico contains paintings of the 14th to the 19th century.

In the vicinity of Macerata are the ruins of the Roman colonia of Helvia Ricina Pertinax (destroyed by Visigoths, 5th–6th cent.), including a theater of the 1st century and a column of the Severan period (2d–3d cent.). The Romanesque Church of S. Claudio al Chienti shows Byzantine influence. Probably a 12th-century structure (restored), it consists of two superimposed churches, interconnected by spiral staircases within two cylindrical towers on the façade. Both plans are rectangular and triapsidal, with two lateral apses. Similar in plan is S. Vittore delle Chiuse (11th cent.), near Genga; however, it is on one level and has a single tower (also with spiral staircase). The Church of the Annunziata (or S. Maria) at Piè di Chienti consists of two superimposed churches with nave and side aisles and apses with radiating chapels.

Pesaro (Lat., Pisaurum). A coastal city settled by the Piceni and then by the Cisalpine Gauls, in 184 B.C. Pesaro became a Roman colonia, a status renewed under Augustus. Destroyed by the Goths, it was rebuilt by Belisarius in the 6th century and became one of the cities of the Maritime Pentapolis. Although the city was badly damaged during World War II, many Gothic and Renaissance buildings (13th–16th cent.) have survived. Of the Roman period the regular layout of the ancient city is discernible, and parts of the bridge that carried the Via Flaminia over the Foglia River still stand. The Cathedral, probably built over the remains of a Roman temple, has a late-13th-century Gothic façade. Under the present floor are parts of a mosaic pavement of the 5th or 6th century. S. Agostino (14th cent.) has a Gothic portal (1413) and a baroque interior. S. Francesco (1356–78) has a Gothic portal and contains 15th-century frescoes and tombs of the 14th century. S. Domenico retains a Gothic Venetian portal (1395), incorporated in the side wall of the Palazzo della Posta. During the Renaissance new walls were erected (15th–16th cent.). The Palazzo Ducale, built in the second half of the 15th century, was destroyed by fire and rebuilt by Girolamo and Bartolomeo Genga in the 16th century. The Rocca Costanza, built from plans by Luciano Laurana in 1474–83, is an excellent example of Renaissance military architecture in the Marches. The Castello Imperiale (1469–72; 1530), designed by Girolamo Genga, is set within a large park on San Bartolo hill. The interior was decorated by Perin del Vaga, Girolamo Genga, Dosso Dossi, F. Menzocchi of Forlì, and others. A number of small Renaissance palaces of brick show Venetian influence (Leonardi and Vaccai palaces). The Palazzo Mosca-Mazzolani (18th cent.) was designed by Giovanni Andrea Lazzarini. The painting gallery of the Museo Civico contains an altarpiece of the *Coronation of the Virgin* (ca. 1475–80) by Giovanni Bellini. The ceramics collection includes majolica ware from Pesaro, Gubbio, Faenza,

and Urbino. The Museo Archeologico Oliveri holds Greek, Etruscan, and Roman artifacts.

In the vicinity of Pesaro is the necropolis of Novilara, which has yielded steles, fibulae, pottery, and weapons of the Iron Age civilization of the Piceni. Sassocorvaro, a citadel founded in the 10th century, has 15th-century fortifications.

San Severino Marche (Lat., Septempeda). Settled by the Piceni (Iron Age necropolis in nearby Pitino), Septempeda became a Roman colonia and municipium in the 3d and 2d centuries B.C. When the town was destroyed by Totila in 545, the inhabitants took refuge on Montenero, a height where they built a citadel. The present city has two nuclei — this ancient Castello and the Borgo. From the Roman period, little survives except the regular layout of the streets. The Castello sector retains a 14th-century tower and the Old Cathedral, with a façade and campanile of the 14th century and remains of a fresco cycle by the Salimbeni brothers, depicting the Life of St. John the Evangelist. The Borgo, established in the Middle Ages, contains the Romanesque Church of S. Lorenzo in Doliolo (8th or 9th cent., remodeled 11th cent.), with nave and side aisles, a presbytery raised above a crypt decorated with frescoes by the Salimbenis and a campanile built in the 14th century. The New Cathedral (S. Agostino), begun in the mid-10th century and enlarged in the 14th century (also remodeled 17th–18th cent.), contains a *Madonna with Angels and Donor* by Pinturicchio. Also in the Borgo district are some small Renaissance palaces and town houses (Palazzo Gentili, Casa Scuderoni, Casa Servanzi, Casa Vannucci). The Palazzo Comunale (1764), by Clemente Orlandi, houses the Pinacoteca.

Senigallia (Lat., Sena Gallica). A Gallic settlement of the Senones, this reached a peak of prosperity from the mid-4th century to the beginning of the 3d century B.C. (burial ground at Montefortino di Arcevia). In 289 B.C. it became a Roman colonia. Destroyed by Alaric in the 5th century, it rose again and was one of the cities of the Maritime Pentapolis. A short stretch of the earliest city wall still exists. The Palazzo Comunale is of the 16th century (restored). The Rocca, a fortress built in 1480–92 by Baccio Pontelli, has a square plan and cylindrical towers at the four corners. The palace of the Duke of Urbino, also attributed to Pontelli, was remodeled in the 18th century. The Church of S. Rocco contains a *Madonna of the Rosary* by Federico Barocci (ca. 1590). S. Martino contains works by Guercino and Palma the Younger. Sta Croce (begun 1576, remodeled early 17th cent.) contains an *Entombment* by Barocci (ca. 1580). The Cathedral was rebuilt in 1790, and its façade dates from the 19th century. On the outskirts of the town is the Church of S. Maria delle Grazie (1491), in Renaissance style, perhaps by Pontelli.

Tolentino (Lat., Tolentinum). An important settlement of the Piceni in the 6th and 5th centuries B.C. (metalwork), Tolentinum became a Roman municipium in the 1st century B.C. In the early Middle Ages the town grew up around a Benedictine abbey (on the site of the present Cathedral). In the 11th century it was an independent commune, and then came under the rule of the Varano and Sforza families until it became subject to the Church in 1445. The oldest church is the Romanesque Carità (11th cent.). An interesting, though stylistically heterogeneous church, the Basilica of S. Nicola was built in the 13th century but was remodeled several times. The façade is baroque (1628–1767), with a transitional Gothic-Renaissance portal by Nanni di Bartolo (1432–35). The single-aisled interior has a 17th-century ceiling. The Gothic Chapel of S. Nicola is decorated with 14th-century frescoes of the school of Rimini. Adjoining the church are the cloister (13th–14th cent.) of the Augustinian monastery and a ceramics museum. The Cathedral is of early medieval origin (8th–9th cent.), but it was rebuilt in the 13th century and entirely remodeled in the 19th. Noteworthy among the modern buildings is the hydrothermal plant at the Santa Lucia springs. The Museo Civico contains mainly Picenian archeological material from the vicinity.

Urbino (Lat., Urbinum Metaurense). The foundations of Iron Age huts uncovered in the vicinity furnish evidence of the early origins of this city, later a Roman municipium. The layout of the modern city, spread out over two hills, is almost entirely that of the Renaissance. The majority of its monuments are connected with the Montefeltro family, who ruled the city from 1213 to 1508 and made of it a brilliant artistic center. There are a number of Gothic churches of monastic foundation: S. Domenico (prior to 1365; interior remodeled 1727–32, by Luigi Vanvitelli) has a simple brick façade with double gable and a 15th-century portal with a lunette terra cotta by Luca della Robbia; S. Francesco (second half of 14th cent.) retains the original portico on its façade, but the interior was remodeled by Vanvitelli in 1740; S. Giovanni Battista (late 14th cent.) has retained its original design intact, its nave with carinated wooden ceiling, and frescoes by the Salimbeni brothers (VI, PL. 383).

The Palazzo Ducale (IX, PL. 98), the most notable building in the city, was built over the remains of an ancient fortress. Designed by Luciano Laurana and begun about 1470, the huge complex was completed in 1563, with the addition of the top floor by Girolamo Genga; restorations were carried out in 1756, 1874, and 1912–19. The plan is on the whole rectangular, with an interior courtyard having an arcade at ground level and a band of windows between pilasters above (IX, PLS. 99, 100). On the west façade facing out over a steep slope are two cylindrical towers with four orders of single-arched loggias superimposed between them (known as the "façade of the torricini"; IX, PLS. 96, 97). The palace interiors were decorated by some eminent Renaissance artists, among whom were Justus of Ghent (panels in the *studiolo* of Federico da Montefeltro) and Pedro Berruguete. The intimate, illusionistic space of this ducal chamber is the work of Bramante (PLS. 80, 100; IX, PL. 97). Several of the larger rooms contain sculpture and fireplaces by Domenico Rosselli (late 15th cent.). Some of the rooms are paneled with wood inlay designed by Francesco di Giorgio Martini (reception room and study), Baccio Pontelli, and Botticelli (study). The perspective plan of the Cappella del Perdono (II, PL. 337) is attributed to Bramante.

The Passionei, Palma, Luminati, and Semproni palaces — all of the same period as the ducal palace — were designed in imitation of Luciano Laurana. The Church of S. Bernardino degli Zoccolanti (I, PL. 397), in Renaissance style (1472) and attributed variously to Bramante or to Francesco di Giorgio Martini, contains the baroque tombs (1620) of Federigo and Guidobaldo, dukes of Montefeltro. The Cathedral was founded in the mid-15th century, and its Palladian façade was completed about 1800, from designs by Camillo Morigia. The dome is by Muzio Oddi (1604); the interior was remodeled in neoclassic style by Giuseppe Valadier in the 19th century and contains works by Federico Barocci, Carlo Maratta, Carlo Cignani, and Giovanni Bandini. The Galleria Nazionale delle Marche (Palazzo Ducale) has an important collection of works of various periods, particularly the Renaissance. The Casa di Raffaello, the birthplace of the artist, is maintained as a public shrine. Sections of the city walls, built in 1507, have also survived.

Latium (It., Lazio). Although divided in antiquity by the Tiber River into Latium to the south and Etruria to the north, the territory of the present region presents relatively homogeneous physical and historical characteristics, even as far back as prehistoric times. The culture of the southern Etruscan cities in the archaic period, of which significant monumental remains surivive (e.g., rock sepulchers, painted tombs, city walls, and art objects of every kind), represents the nucleus of the earliest and most intensive development of Etruria in general. This culture had immediate parallels and reflections in Rome, temporarily part of the Etruscan orbit, and also in Faliscan and Latin cities. The rise of Rome, starting in the 4th century B.C., marked the beginning of the progressive concentration in this city of innovating impulses, continually renewed Greek influences, and the most intense building and artistic activities. At the same time there was also some notable development of other cities and sanctuaries in Latium, especially during the republican period. Roman influence was spread by way of the former consular roads, and the architectural and artistic history of Latium became identical in great part with that of Rome (see above, *Rome*). Nevertheless, in the Middle Ages, Latium exhibited vitality and originality in its pre-Romanesque and Romanesque churches, in the work of the Cosmati, and in the Cistercian abbeys. Since the Renaissance, the most important developments in the region (excluding Rome) have involved villa and military architecture. In southern Latium, the influence of the Neapolitan baroque was widespread.

Alatri (Lat., Alatrium, Aletrium). This city of the Hernici came into the orbit of Rome in the 4th century and later became a municipium. Surviving is the complete circuit of walls, in polygonal work, around the city and acropolis, with gates of the late 4th century B.C., assimilated in medieval constructions in the destroyed sections. In the lower city are remains of an aqueduct. Devastated in the 6th century of our era by Totila, the city was rebuilt with the name of Civitanova. It became the seat of a bishopric in 547, underwent various dominations, and passed in 1389 to the Church. The modern city retains its medieval character. The Romanesque-Gothic Church of S. Maria Maggiore has a rose window on its façade and a campanile with twin-arched windows. The church preserves a painted wooden sculpture of the Virgin and Child (the "Madonna di Costantinopoli"; early 13th cent.). S. Stefano has been remodeled, but it preserves the original portal (1275). S. Silvestro contains Renaissance frescoes. S. Francesco is a late-13th-century structure with a Gothic rose window and portal; the interior has been redone. The Cathedral and the episcopal palace are on the acropolis. The most important complex of secular architecture is the tower-house of Cardinal Gottifredo and the adjoining Gothic Palazzo Casagrandi. Noteworthy, too, are the Palazzo del Collegio Conti Gentili and the Museo Civico.

Anagni (Lat., Anagnia). This city of the Hernici was conquered by Rome in 306 B.C. Surviving are walls in ashlar (perhaps 3d–2d cent. B.C.) and remains of baths and of a Mithraeum. An ellipsoidal area on the plain has been tentatively identified with the Circus Maritimus Anagninus mentioned in Livy (IX, 42, 12). Anagni became a diocese in 487 and was of great importance in the Middle Ages, especially because of historical events connected with the pontificate of Boniface VIII. The city has largely preserved its medieval appearance (e.g., Via Dante, Via Tufoli, Piazza delle Carceri, part of the Corso). The 13th-century Palace of Boniface VIII is a ruin. The Palazzo Comunale (13th cent.; extensively restored) has two façades, a loggia passageway, round arches, a 15th-century upper loggia, and windows with intersecting arches that recall Moorish style. The Barnekow house, with external staircase, dates from the 13th–14th century. The Cathedral (S. Maria, 1074–1104), a Romanesque structure, was remodeled in the 13th century. The façade has three portals and three single-arched windows, and there are three apses in Lombard style. On a portico with two arches and a balcony is a niche with a statue of Boniface VIII (1295). The interior has three aisles, with piers alternating with cylindrical pillars, and a Cosmati pavement (ca. 1226; Cosma di Jacopo). The choir enclosure is closed off by plutei and has a Romanesque mosaic floor and ciborium. The paschal candlestick and the bishop's throne (1263) are the work of one of the Vassallettos (see COSMATI). The Caetani Chapel, with the Caetani tomb, preserves a Madonna and Child of the Roman school (1325). The crypt (said to be that of St. Magnus) has three aisles and three apses, a pavement (after 1231) by Cosma and his sons, and important 13th-century frescoes. The rectangular Romanesque campanile was remodeled in the 19th century. The Cathedral treasury adjoins the Cathedral. In the Church of the Cappuccini are remains of 13th-century frescoes.

Paribeni, III, Milan, 1956, pp. 329–34; EAA, s.v.

Aquino (Lat., Aquinum). This was successively a Volscian city, a federated Roman city, a municipium, and a colony. Ancient walls survive, perhaps from the 3d century B.C. and from the Augustan age. Other remains include the Capitol, a theater, a structure that may have been part of a thermal complex, an amphitheater, an aqueduct, and a triumphal arch. These monuments all date from the Augustan Era or slightly later. Destroyed by Totila and then by the Lombards, Aquino was rebuilt about the 8th century in the vicinity of the old city. The fief of the counts of Aquino, the city passed in 1796 to the Kingdom of the Two Sicilies. On the ruins of the Temple of Hercules Liberator, the Church of S. Maria della Libera was erected in 1125. The church was modeled after the Basilica of Montecassino.

Bolsena (Etruscan, Velsna; Lat., Volsinii). Situated on Lake Bolsena, the medieval city developed on the slope of a hill. In more recent times Bolsena has spread into the plain toward the lake. The Etruscan city was destroyed by Rome in 265 B.C. and later reconstructed. Of the Roman city there remain traces of private buildings, baths, and an amphitheater. A sanctuary, perhaps that of Nortia, also survives. In 1468 Bolsena passed to the Church. The Church of S. Cristina, with three aisles and apses, was constructed in the 11th century over Christian catacombs. The façade was redone in the 15th century. Within the church a sculptured Romanesque portal gives access to the Chapel of the Miracolo and the adjoining Grotto of S. Cristina (part of the catacombs), which preserves a 9th-century ciborium and a painted terra cotta of St. Christina of Bolsena by G. della Robbia. In the Chapel of the Rosario and the apse of the right aisle, there are 15th-century frescoes of the Sienese school. The castle dates from the 12th–13th century; rectangular in design, it has towers at the corners. The Palazzo Cozza-Spada has frescoes of the school of the Zuccaris. The Antiquarium Comunale is in the Palazzo Comunale.

In nearby Gradoli is a Farnese palace, a 16th-century structure attributed by some to Vignola. In Capodimonte is a 13th-century square castle, within the grounds of which is an octagonal palace of the Farnese family, variously attributed to A. da Sangallo the Younger or to Vignola. In Marta is a Renaissance palace of the Farnese family. On the island of Bisentina is another Farnese palace and the Church of SS. Giacomo e Cristoforo, begun by A. da Sangallo the Younger and finished by Vignola. Also on the island are five 15th-century chapels, two of which preserve frescoes by the school of Benozzo Gozzoli.

Caere (Etruscan, Chaire; It., Cerveteri). This Etruscan city, which was particularly important in the 7th–6th century B.C., was conquered by Rome in the 4th century B.C.. The area of the ancient city, inside of which is the modest medieval and modern town of Cerveteri, preserves traces of ancient walls (5th–4th cent. B.C.). Various Etruscan temple areas with terra-cotta decorations have been discovered, as well as a Roman theater with imperial statues. In the Regolini-Galassi tomb (7th cent. B.C.) were found rich Orientalizing furnishings (V, pls. 25, 429; X, pls. 404, 408). Northwest of the city, on the Banditaccia hill, there is a monumental Etruscan necropolis with numerous tumuli (excavated and restored), hypogeum tombs (including the Tomb of the Reliefs, pl. 95), and sepulchral roads. The material discovered dates from the 7th–3d century B.C. There is another necropolis with monumental tombs on Mt. Abatone.

Pyrgi, the port of ancient Caere was near the modern Santa Severa. Remains of an Etruscan sanctuary survive, as well as polygonal walls of the 3d–2d century B.C. and a medieval castle.

Casamari. The Abbey of Casamari (I, pl. 416), in an isolated site near Veroli, was founded in 1005. It adopted the Benedictine rule in 1036 and passed in 1151 to the Cistercians, who began reconstruction in 1204. The abbey declined in the 18th century and was sacked by the French in 1799. The church (consecrated in 1217) is Cistercian Gothic in style and modeled after that of Fossanova.

Cassino (Lat., Casinum). Of Volscian origin, the city was conquered by the Samnites and, in 312 B.C., by the Romans. The ancient city, on the slopes of Montecassino, was joined to the acropolis (where the abbey now stands) by polygonal walls, of which there are some remains. The most important monuments date from the 1st century of our era: an amphitheater, a theater, baths, and the central-plan tomb known as the tomb of Ummidia Quadratilla, which was transformed into the Chapel of the Crocefisso. Cassino was destroyed in the 6th century by the Lombards. At first only the area around the forum continued to be inhabited. In the 9th century the inhabitants moved to the nearby area of San Germano (renamed Cassino in 1871). The city, totally destroyed in World War II and subsequently rebuilt, preserves traces of the foundations of the 8th-century Church of S. Maria delle Cinque Torri.

On top of the mountain, St. Benedict founded the Abbey of Montecassino in 529. It was reconstructed by Abbot Desiderius in the 11th century. Razed to the ground by an earthquake in 1349, it was again rebuilt. Completely destroyed in 1944, it has been reconstructed in its prewar aspect. The basilica was rebuilt after the design (1649) of C. Fanzago.

Civita Castellana (Lat., Falerii Veteres). This Faliscan city became an ally of Rome in 357 B.C., but rebelled in 293 and 241. The city was destroyed and its inhabitants transferred to nearby Falerii Novi. Sections of the ancient city and acropolis walls survive. There are also remains of temples and sanctuaries. In the 8th or 9th century, the inhabitants of Falerii Novi returned to the site of Falerii Veteres, then known as La Civita. The city assumed its present name, Civita Castellana, because of its dominion over nearby castles. It was successively the property of the pope and a fief of the Sevellis and of the Borgias. The 12th-century Cathedral is preceded by a portico designed by Jacopo di Lorenzo and his son (I, pl. 302). Jacopo di Lorenzo also did the right portal of the façade (III, pl. 478; see COSMATI). The interior was redone in the 18th century. The pentagonal fortress dates from 1494–1500 and has an octagonal keep, which was added by Antonio da Sangallo the Elder. Parts of the rectangular courtyard are Renaissance. Inside there are frescoes by the Zuccaris and Pier Matteo di Amelia.

Falerii Novi preserves large city walls with arched gates, from the Roman period. There are also remains of an amphitheater and traces of a theater. Dating from the medieval period are the ruins of S. Maria di Falleri (11th–12th cent.), with three aisles, a large transept in Cistercian style, and five apses crowned by small arches.

Civitavecchia (Lat., Centumcellae). This commercial city was erected around Trajan's port. There are remains of the Taurine Baths. Near Civitavecchia, Bronze and Iron Age habitations and an Etruscan necropolis have been excavated. Dominated by the Byzantines and then by the Saracens, who drove away the inhabitants, the city was rebuilt in A.D. 880 with the name of Civitavecchia. The city enjoyed particular prosperity under papal dominion (from mid-15th cent.), when the port was reconstructed for the papal fleet.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

The city is essentially modern in appearance with broad streets. The Forte Michelangelo has a rectangular ground plan with cylindrical towers at the corners. The design was Bramante's (1508), and construction was begun under the direction of Bramante himself. Building continued under the successive supervision of Antonio da Sangallo the Younger, Giuliano Lero, and Michelangelo. It was Michelangelo who added the upper part of the octagonal keep. Also noteworthy are a fountain by L. Vanvitelli and the arsenal by Bernini. The Museo Civico has a fine archaeological collection.

Cori (Lat., Cora). As early as the 5th century B.C., this was a Latin outpost in Volscian territory. It became a Roman municipium before 211 B.C. Having been destroyed several times, it passed in the 15th century to the Church. Divided into Cori a Monte and Cori a Valle, it occupies the summit and slopes of a hill, with narrow streets closed in by 15th- and 17th-century stone houses. There are polygonal walls with towers. Ancient remains include a Doric temple, perhaps that of Hercules (ca. 100 B.C.; VII, PL. 201), two Corinthian columns of the so-called "Temple of Castor and Pollux," and a bridge from the republican period. The Collegiate Church (S. Maria della Pietà) preserves a 12th-century paschal candlestick with a sculptured base. The Church of S. Oliva comprises two churches of different epochs joined longitudinally by large arches in their common wall. The older building has the structure of a crypt. The other, begun in 1477 and finished in 1677, has 16th-century frescoes on the vault and in the apse. The cloister has a portico on all four sides; a loggia above runs around three sides. The Monte di Pietà dates from the 16th century, and the Santuario del Soccorso from 1626.

BIBLIOG. G. Giovannoni, Il chiostro di S. Oliva, L'Arte, IX, 1906, pp. 108–16; A. von Gerkan, Die Krümmungen im Gebälk des dorischen Temples in Cori, RM, XL, 1925, pp. 167–80; A. Accrocca, Cori, Rome, 1933; G. Lugli, EAA, s.v. Cori, II, 1959, p. 836.

Ferentino (Lat., Ferentinum). This Hernican city was conquered by the Volsci and then by the Romans. Roman city walls survive, with gates and towers restored in the Middle Ages. The acropolis, in the form it took in the time of Sulla (inscriptions by the censors Hirtius and Lollius), consists of a flattened space sustained by powerful sustaining walls (squared masses of limestone and rectangular blocks of travertine). The episcopal palace is located on a jutting portion of the acropolis. Beneath the episcopal palace is the substructure of a large construction that may have been a temple. There are meager remains of a theater of the period of Trajan and Hadrian. Outside the Porta Casamari the testament of Aulus Quintilius (who lived in the time of Trajan) is carved on a rock. From the Middle Ages Ferentino was almost always the property of the Church. The city is predominantly medieval in appearance. Located on the ancient acropolis is the Romanesque Cathedral, with three aisles and three semicircular apses and a beamed ceiling. The pavement (1116) and paschal candlestick are Cosmati work, and there is a 13th-century ciborium by Drudo (Drudus) de Trivio. The campanile has twin-arched and triple-arched windows. The Palazzo Comunale preserves remains of the original 12th-century structure. The Palazzo dei Cavalieri Gaudenti is medieval. The Church of S. Maria Maggiore is a Cistercian Gothic structure. The façade has three portals and a rose window, and a polygonal dome tops the crossing. The Church of S. Francesco has a Romanesque-Gothic façade. The Church of S. Agata dates from 1750. The Collezione del Comune contains archaeological finds and medieval reliefs.

Ferento (Lat., Ferentium). There are remains of a Roman city in an area that had already been inhabited in Etruscan times. These include baths and a theater partly executed in brick (1st century of our era). In the area are Etruscan and Roman hypogea and remains of the Church of S. Bonifacio (9th–10th cent.).

BIBLIOG. A. Gargana, Ferento, Viterbo, 1935; A. Gargana, Il teatro di Ferento, Viterbo, 1937; A. Rossi Danielli, Ferento, Viterbo, 1959; G. Maetzke, EAA, s.v. Ferento, III, 1960, pp. 623–24.

Fondi (Lat., Fundi). Once a city of the Volsci, Fundi later became Roman. The ancient rectangular plan of the city has been preserved. There are remains of the ancient walls and of villas and tombs. The city was destroyed by the Saracens in the 9th century and later passed to the Church. In the 13th century it came under the dominion of Naples and was successively a fief of various families. It enjoyed its greatest prosperity under the Caetani family but declined in the 16th century. Among the medieval monuments is the Church of S. Pietro, constructed in the 4th–5th century over a pagan temple and reconstructed in the 12th, 13th, and 14th centuries. The façade portal is flanked by column-bearing lions and has a sculptured architrave. The interior has been considerably restored. There are remains of the 4th-century mosaic pavement, an ambo by the Roman Giovanni di Nicola (1286), a triptych by Antoniazzo Romano, and the tomb of Cristoforo Caetani (15th cent.). The campanile dates from the middle of the 13th century. S. Domenico (reconstructed in 1466) has a Renaissance portal. The campanile dates from 1278. The Renaissance Church of S. Maria Assunta (1490–1508) has a travertine façade. The Palazzo del Principe has a large cylindrical tower (15th cent.) on a square base. The Castle proper, which is rectangular, has cylindrical crenelated towers at the corners. The Antiquarium is in the cloister of the former Monastery of S. Francesco (14th cent.).

Fossanova. The Abbey of Fossanova was founded by the Benedictines in the 9th century and passed to the Cistercians in the 12th century. The Cistercians rebuilt the monastic complex and erected the Gothic church. The buildings are arranged, according to the traditional monastic scheme, around a quadrangular cloister. The cloister is Romanesque on three sides: the fourth side, rebuilt 1280–1300, is Gothic. The church, which was consecrated in 1208, is the first Italian structure in the Cistercian Gothic style. The simple façade (VI, PL. 331) has a portal by the Cosmati and a rose window. There are remains of an atrium that once stood in front of the church. The sides of the church are buttressed, and the transept and apse are rectangular. The lantern is octagonal. The unadorned interior has three aisles with piers and engaged columns. There are smooth groin vaults and acute transversal arches (VI, PL. 331). The apse is flanked by chapels (two on each side) facing the transept. To the north of the cloister is the chapter room with Romanesque walls and Gothic vaults (mid-13th cent.).

Frascati. The city developed on the site of an immense Roman villa of the Imperial period. When nearby Tusculum was destroyed in A.D. 1191, the refugees settled in Frascati. Little remains of the medieval city because of extensive later rebuilding. The city was badly damaged in World War II and has been reconstructed. The Church of S. Maria in Vivario (popularly known as S. Rocco) was reconstructed with a basilican plan at the end of the 15th century. The Romanesque campanile was erected in 1305. Remains of the former fortress (now the bishop's residence) include the keep and corner towers. The Church of the Cappuccini (S. Francesco) has a simple façade (1575) and a single aisle. The façade of the Church of the Gesù may have been erected after a design by Pietro da Cortona. The interior has frescoes by A. Pozzo and assistants. In the adjacent seminary are frescoes by Pozzo and T. Kuntz. The Cathedral (S. Pietro) was designed by C. Rainaldi and P. De Rocchi, with a façade by G. Fontana and two campaniles of later date. The Villa Aldobrandini (or Belvedere; G. della Porta, C. Maderno, C. Fontana) has decorations by the Zuccaris, the Cavalier d'Arpino, and the school of Domenichino. The park is adorned with artificial grottoes, statues, terraces, and ingenious fountains. The Villa Grazioli was built toward the end of the 16th century. Noteworthy, too, are the Villa Muti and the Villa Lancellotti. The 16th-century Villa Torlonia boasts decorative waterworks designed by C. Maderno. The Villa Falconieri (1545–48) was enlarged by Borromini. The Villa Mondragone was built in 1573–75. The Museo Tuscolano contains local archaeological materials.

Near Frascati are the ruins of Tusculum, a powerful Latin city that enjoyed particular prosperity in the Roman Imperial period as a resort. Remains survive of the acropolis, forum, cistern, theater, amphitheater, and the so-called "Villa of Cicero."

Gaeta (Lat., Caieta). A port and resort town as early as Roman times, Gaeta preserves remains of villas and of two mausoleums (ca. 20 B.C.), that of L. Munatius Plancus (the so-called "Tower of Orlando") and that of L. Sempronius Atratinus. The city was the scene of complex political events in the Middle Ages and a military stronghold. The medieval center, much damaged in World War II, is crowded around the base of the castle, which was built in the 8th century and subsequently enlarged and restored (13th–16th cent.). The upper castle is Aragonese, and the lower is an Angevin structure surrounded by bastioned walls. The Cathedral (consecrated 1106) preserves the original campanile but is otherwise an 18th-century renovation. The Museo del Duomo has a fine collection of sculpture and paintings, including three 11th-century exultet parchments. S. Giovanni a Mare (12th cent.) represents a compromise between the Byzantine central plan and the basilican plan. Inside there are remains of what may have been the original fresco decoration as well as 15th-century work. S. Lucia is a 16th-century enlargement of an older church, of which are preserved transepts and remains of the 13th-century mosaic pavement. The Church of the Trinità stands on a rocky spur. Noteworthy is the adjacent monastery (11th century; reconstructed) and the Chapel of the Crocefisso (1434). The Church of the Annunziata dates from 1321 but was remodeled in 1621. Of the early structure, a Gothic portal survives. The palace known as the Palazzo Ladislao dates from the 15th century.

Near Gaeta is Formia, which preserves some Roman ruins, including regular polygonal walls, a piscina, an amphitheater, an aqueduct, a cistern, the so-called "Villa of Cicero," and remains of other villas. The so-called "Tomb of Cicero" also survives. The Antiquarium in Formia has an archaeological collection and medieval coins.

Grottaferrata. This city in the Alban Hills developed around the Abbey of Grottaferrata, which was founded in 1004 by Basilian monks on the remains of a Roman villa. The abbey was fortified in the 15th century by Giuliano da Sangallo the Elder and B. Pontelli. The 11th-century Church of S. Maria was extensively remodeled in the 18th century and restored at the beginning of the 20th. Preceded by a portico and flanked by a 12th-century campanile, the church preserves a marble portal with carved door (11th–12th cent.), a contemporaneous mosaic, and a sculptured baptismal font (10th–11th cent.?) in the narthex. The basilican-plan interior preserves a triumphal arch with a 13th-century mosaic as well as Byzantinizing frescoes. The Chapel of St. Nilus was frescoed by Domenichino (1610). The Museo della Badia contains ancient and medieval sculpture as well as tapestries and sacred vestments.

Minturno (Lat., Minturnae). This city of the Ausones became a Roman colony in 296 B.C. There are remains of polygonal walls and ashlar walls, the forum (crossed by the Appian Way) with portico, temples, theater, traces of the amphitheater, baths, and an aqueduct. Minturno was devastated by the Lombards toward the end of the 6th century, and the inhabitants retreated to the hill where the present city, medieval in appearance, is located. The Church of S. Pietro was erected in the middle of the 12th century, enlarged and remodeled in the 17th, and restored in the 20th century. The campanile has Romanesque twin-arched windows. The three-aisled church has Gothic arches. The church preserves works by Pellegrino (Peregrino) da Sessa, including the pulpit (1260), the paschal candlestick, and *schola cantorum*. Some sections of the Castello (Palazzo Baronale) date from the 14th and 15th centuries.

Montefiascone. The origin of Montefiascone is uncertain, although it probably existed in antiquity. The city was devastated during the barbarian invasions. Montefiascone became a free commune in the 12th century and long remained independent. The Cathedral (M. Sanmicheli, 1519, and C. Fontana) has a façade designed by P. Gazola (1840–43) with a portal flanked by two campaniles. The octagonal interior is surmounted by an octagonal dome. S. Flaviano consists of two superimposed churches. The façade has three arches below and a small loggia above. The lower church (11th cent., restored in 14th cent.) has three aisles (with piers and fine capitals) and three apses arranged almost in a semicircle. The upper church was built later and follows the division into three aisles, but, since the central section has no floor and is connected directly with the lower church, the upper church practically forms a gallery for the lower. The churches preserve interesting frescoes, dating, for the most part, from the 14th century.

Nepi (Etruscan, Nepet; Lat., Nepete). An Etruscan city and later a Roman colony, Nepi was destroyed by the Lombards. Subsequently it was rebuilt and passed to the Church. The Cathedral, an Early Christian structure, was destroyed and reconstructed many times. It preserves the Romanesque portico with three arches and a crypt. The interior has five aisles and contains a panel by Giulio Romano and the sarcophagus of St. Romanus, attributed to Bernini. S. Biagio preserves a Romanesque portal and an oratory with a Romanesque façade. In the apse are frescoes of various periods. The Palazzo Comunale was begun by Vignola and completed in the baroque period. The square in front of the palace has a fountain designed by Bernini.

Near Nepi is Castel Sant'Elia. The Basilica of Castel Sant'Elia, founded in the 6th century and reconstructed in the 11th, has a façade with three portals. The three-aisled interior has columns taken from ancient structures. In the apse and transept are frescoes signed by Roman artists of the 11th–12th century (the brothers Giovanni and Stefano, and Nicolò, nephew of Giovanni) and an 11th-century pulpit. Nearby is the Church of the Madonna ad Rupes.

Ostia. The city was built at the former mouth of one branch of the Tiber River. (The Latin *ostium* means "river mouth.") The city became a Roman colony about 335 B.C. By the 3d century B.C.

UP State Museum, Lucknow

it was already an important port and subsequently became the base of the Roman fleet. The excavations of Ostia Antica constitute one of the most important archaeological complexes in Italy, especially for the constructions of the Imperial period. Of the oldest, rectangular-plan nucleus, there remain traces of the walls and of the forum. The walls erected by Sulla mark the city limits as they were in the 3d–2d century B.C., slightly less extensive than in the Imperial period. The principal monuments include the Capitol (2d cent. B.C.), a theater (Augustan age), the forum built under Tiberius, and the Temple of Roma and Augustus. The curia and basilica date from the time of Trajan, the Baths of Neptune and guard barracks from the time of Hadrian. The Piazzale delle Corporazioni, where the merchants had their *scholae*, was constructed under Septimius Severus. Other monuments include horrea, Mithraea, the campus of the Magna Mater, and a synagogue. Especially interesting are remains of private constructions, with apartment houses of several stories and in blocks (*insulae*). The city survived in Christian times, and there are remains of a basilica. It was then abandoned because of the silting-up of the port and the threat of the Saracens. Immense quantities of mosaics, sculpture, and other objects have been excavated (VIII, PLS. 96, 232; IX, PL. 251; X, PL. 176). In the medieval area are two works of B. Pontelli, the small Church of S. Aurea and the castle. The Museo Ostiense contains archaeological finds.

Near the mouth of the right branch of the Tiber stood the city of Porto (Lat., Portus), with the port of Claudius. There are remains of moles, the lighthouse, boats, and warehouses. The hexagonal Portus Traiani (now Lake Traiano) was dug in Trajan's time, after the silting-up of the port of Claudius. The Roman necropolis of Isola Sacra comprises more than 100 tombs (2d–4th cent.).

Scrinari, Strutture portuali relative al "porto di Claudio" messo in luce durante i lavori dell'Aeroporto Intercontinentale di Fiumicino (Roma), Rass. dei Lavori Pubblici, VII, 1960, pp. 173–90.

Palestrina (Lat., Praeneste). The city was already flourishing in the 8th–7th century B.C. Remains of this period include the Orientalizing Bernardini and Barberini tombs, whose furnishings are now in the Museo di Villa Giulia, Rome (X, PLS. 402, 408, 409). The city was an ally and then an enemy of Rome until it became a *civitas foederata* and, in 90 B.C., a municipium. Sacked by Sulla, it again became a municipium under Tiberius. The height on which the village of Castel San Pietro Romano now stands was the acropolis of Praeneste. The center of Palestrina is occupied by the Sanctuary of Fortuna Primigenia (VII, PLS. 198, 199, FIG. 399; see HELLENISTIC-ROMAN ART), of which there are two sections. The lower complex (behind the Cathedral) includes a hall of basilican type (the so-called "Sacred Area") flanked by two structures (almost certainly nymphaea); the so-called "Antro delle Sorti," with a polychrome mosaic pavement representing an ocean landscape; and the apsed room where the celebrated mosaic of the Nile was found (VII, PL. 197). The upper complex extends over five levels, the upper part of which is incorporated in the Palazzo Barberini. The entire architectural complex of the sanctuary seems to date from the same period, that of Sulla, but some consider the lower part more recent. Because of its organic structure and its scenographic sense, the sanctuary is the most important monument of Roman republican architecture. After the time of Sulla, the city expanded toward the south. Nearby are remains of villas of the Imperial age. The medieval city was built on the ruins of the sanctuary. Occupied by the Lombards, it later became a fief of the Counts of Tuscolo. The city was destroyed in 1298 by Pope Boniface, who erected another city (Civitas Papalis) to the south, on the site of the modern Church of the Madonna dell'Aquila. The city was reconstructed under the auspices of the Colonna family, to whom it remained subject until the 17th century. The Cathedral (S. Agapito) was initially the result of the transformation of an ancient temple. In the 12th century the campanile was built, side aisles were added, and the nave was lengthened. The Cathedral has been remodeled and restored at various times. The present structure preserves the original campanile and the upper part of the original façade. The Palazzo Baronale (now Palazzo Barberini) was constructed in the 11th century on the remains of the upper part of the sanctuary. The palace was rebuilt in 1493 by the Colonnas and in the 17th century by the Barberinis. The Barberini family also erected the Church of S. Rosalia (1656–60), which contains four tombs of that family. The Palestrina Museo Archeologico Nazionale is in the Palazzo Barberini.

Rieti (Lat., Reate). Once the capital of the Sabines, Reate later became a Roman municipium. It was a Guelph commune and a residence of popes in the Middle Ages. Noteworthy sections of the 13th-century walls survive. The cathedral that was begun in 1109 on the site of the 5th-century Basilica of S. Maria is the crypt of the modern Cathedral. The crypt has three aisles divided by 16 ancient columns. The upper church was built in the 14th century and transformed in 1639. It preserves the Romanesque façade, before which stands a Renaissance portico (1458). The interior is built in the form of a Latin cross with three aisles. The campanile is medieval. The Palazzo Vescovile dates from 1283 but was remodeled later. The Loggia Papale was built in 1288 and restored in the 20th century. The Arco del Vescovo (Bishop's Arch) was built in 1298. The former Church of S. Domenico (13th cent.) preserves frescoes of the 14th, 15th, 16th, and 17th centuries. Adjacent is the former Oratory of S. Pietro Martire, frescoed by L. and B. Torresani (1552–54). S. Agostino preserves a fine Romanesque portal (early 13th cent.). The campanile is also Romanesque. S. Francesco (1245) has a Romanesque portal. The interior of the church is built on a Latin-cross plan. The adjacent Oratory of S. Bernardino has 16th-century stuccoes by Tobia Cicchino (known as Tobias Aquilanus; 1578). S. Pietro Apostolo (1153) has a Romanesque portal and a 15th-century carved wooden door. The Chiavelloni, Colelli, and Vecchiarelli palaces, the Casa Zapparelli, and the Palazzo Vincentini (now Palazzo del Governo) are interesting examples of civil architecture. The Palazzo Comunale (14th cent.) has a baroque façade by F. Brioni (1748). The remains of the 14th-century Palazzo del Podestà are incorporated in the Palazzo del Seminario. *Museum*: Museo Civico.

Sermoneta. This town of medieval appearance (mentioned for the first time in 1222) is still partly surrounded by the original walls. The Castello Caetani was erected at the end of the 13th century by the Caetanis, feudatories of the town from 1297. Contemporaneous is the Cistercian Gothic Cathedral, which has been extensively remodeled. The campanile has five stories of twin-arched windows. The Cathedral preserves a *Madonna* by Benozzo Gozzoli and 16th-century frescoes. S. Giuseppe has frescoes by G. Sicciolante.

Near Sermoneta is the Abbey of Valvisciolo with a 13th-century church (SS. Pietro e Stefano). It has a simple façade decorated with a rose window. Remains of the abbey include the chapter room and a cloister (restored).

BIBLIOG. M. Raymondi, La Badia di Valvisciolo, Velletri, 1905; M. Raymondi, L'abate e la Badia di Valvisciolo, Arte e storia, XXXI, 1912, pp. 241–48; R. Fraccaro de Longhi, L'architettura delle chiese cistercensi italiane, Milan, 1958, pp. 269–75.

Subiaco (Lat., Sublaqueum). The town grew up around a villa built for Nero, of which imposing ruins remain. In the 6th century, St. Benedict organized there what was to become the Benedictine Order. Twelve monasteries were erected, eleven of which were destroyed in 601 by the Lombards. The only one remaining is that of S. Scolastica, which has been remodeled and enlarged through the centuries. It comprises a church and three adjoining cloisters,

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

dominated by a Romanesque campanile (1053). Of the three cloisters, the first (1580) was completely rebuilt after World War II; the second (1052) was reconstructed in Gothic style in the 13th century; the third is the original work of Cosma and his sons Luca and Jacopo (1227–43; see COSMATI). The Church of S. Scolastica, consecrated in 981, was renovated in Cistercian style in the 13th century and transformed in neoclassic style by G. Quarenghi in 1769. The construction of the Sacro Speco, or Monastery of S. Benedetto, was begun in the 13th century. The complex comprises two superimposed churches and several chapels supported on a series of nine arches. Three corridors, frescoed in the 14th and 15th centuries, lead into the upper church, which is composed of several irregularly shaped rooms with groin vaults, almost completely covered with 14th- and 15th-century frescoes. The lower church was carved out of the rock, without any real organic plan. It preserves frescoed scenes from the life of St. Benedict painted by Conxolus (13th cent.). In the Grotto of S. Benedetto (transformed into a chapel) is a marble statue of St. Benedict by A. Raggi. The Chapel of S. Gregorio preserves a fresco of St. Francis (1228) painted a few years after his supposed visit to Subiaco. The Scala Santa and the adjacent chapel are decorated with 14th-century frescoes of the school of Siena. On the opposite side of the town, near a medieval bridge, is S. Francesco (1327), a single-aisled church with a Romanesque campanile. The churches of S. Pietro and S. Giovanni Battista have Romanesque campaniles. S. Andrea, built on a Latin-cross plan, has three aisles and a neoclassic façade (1795).

Sutri (Etruscan, Suthri; Lat., Sutrium). This Etruscan city came under the domination of Rome in the 4th century B.C. Remains include an amphitheater dug out of tuff (1st cent. B.C.) and an Etruscan tomb (later converted into the Church of the Madonna del Parto). This was the first city to be donated to the Christian Church; Liutprand, king of the Lombards, gave Sutri to Pope Gregory II. The three-aisled Cathedral has been completed remodeled. Of the original Romanesque construction are remains of the mosaic pavement, the three-aisled crypt of the presbytery, the campanile, and remains of 13th-century frescoes. Noteworthy civil structures are the Palazzo Comunale and the Palazzo Episcopale, the latter with Gothic windows. In nearby Bassano di Sutri is the Palazzo Odescalchi, which preserves frescoes by Domenichino and the school of the Zuccaris. The garden was designed by Vignola.

Tarquinia (Etruscan, Tarchuna; Lat., Tarquinii). One of the greatest cities of Etruria, it was finally conquered by Rome in the 3d century B.C. and federated. It became a municipium in 90 B.C. and was still prosperous in the Imperial period. Remains include walls of the 5th–4th century B.C., the so-called "Ara della Regina," the podium of a large temple (capitals and fragments of a terra-cotta pediment with winged horses), and Roman baths. The Etruscan necropolis of Tarquinia, its tombs painted with funerary scenes and scenes of everyday life, provides the most important surviving examples of Etruscan painting of the 6th–1st century B.C. About 50 painted tombs are preserved, most of which can be visited (I, PLS. 363, 364; IV, PL. 263; V, PLS. 32, 41, 42, 46; VI, PLS. 55, 56; IX, PL. 2; X, PL. 480). Some of the wall paintings have been detached and are in the Museo Nazionale Tarquiniese (I, PLS. 368, 374). Among other objects of artistic interest found in the tombs, particularly noteworthy are the Hellenistic stone sarcophagi adorned with portraits and reliefs. Tarquinia was destroyed in the Middle Ages, and a new city, Corneto, was built nearby. Corneto, which took the name of Tarquinia in the 20th century, is a picturesque town with some notable monuments. Surrounded by walls built in the 9th–10th century (several times restored), Tarquinia is predominantly medieval in appearance and has many towers. One of the oldest churches is that of S. Maria di Castello (1121–1208), which incorporates Lombard forms with Cosmati decoration. The façade has three portals, the central one by Pietro di Ranuccio (1143); the twin-arched window above it is by Nicola di Ranuccio (III, PL. 478). The Romanesque Church of S. Giacomo Apostolo has a single aisle. Arabic-Byzantine influences are evident in the cupola. S. Martino and S. Salvatore are also Romanesque. The following churches were built in the period of transition from Romanesque to Gothic (13th cent.): S. Pancrazio, with a rose window on the façade and three semicircular apses (one redone); the Annunziata, in the shape of a Tau cross; S. Francesco, in the shape of a Latin cross, with Romanesque piers and a raised transept with Gothic arches; and S. Giovanni Battista (remodeled), with three apses. The Palazzo Vitelleschi, built in the first half of the 15th century, incorporates earlier Gothic structures. The palace now houses the Museo Nazionale Tarquiniese.

Terracina. The Volscian city of Anxur became the Roman colony of Tarracina in 329 B.C. (remains of polygonal walls). The Via Appia served as the city's *decumanus maximus*. There are remains of a forum and basilica in the upper city. In the lower city (outside the walls) are other ruins. There are remains of baths, an amphitheater, and, on Mt. S. Angelo, a temple of Jupiter Anxur. The city was a possession of the Church from the Middle Ages to the 19th century. The medieval center of Terracina, on the slope of a hill, has narrow streets and houses with external staircases. The modern part of the city extends from the Appian Way to the sea. The Cathedral was consecrated in 1074, completed in the 13th century, partially redone in the 17th century, and restored in the 20th century. It was built on the site of a temple of Apollo, of which parts are preserved. On the architrave of the portico of the Cathedral is a 12th-century mosaic frieze. The interior has three aisles divided by ancient columns, a Cosmati pavement (III, PL. 483), a Cosmati pulpit (1245) supported by five columns on lions, and a 13th-century paschal candlestick. The 14th-century brick campanile has four stories of blind pointed arches. The Gothic influence of the nearby Abbey of Fossanova is evident in the architecture of other churches. S. Domenico (13th cent.) has a large rose window on its façade. S. Francesco and the Annunziata were severely damaged in World War II. There are several interesting civil structures of the Middle Ages. The Antiquarium has an archaeological collection.

Tivoli (Lat., Tibur). An ancient city that entered the Roman orbit very early, Tivoli preserves notable monuments of antiquity, especially of the Roman republican period. Remains include the *mensa ponderaria* near the modern Piazza del Duomo, where the forum was located; a round Corinthian temple, the so-called "Temple of the Sibyl," or "Temple of Vesta" (VII, PL. 201); a rectangular temple (1st cent. B.C.); a market; an amphitheater; baths and a large sanctuary of Hercules Victor. There were many villas in the area (including those of Cassius, Horace, and Maecenas), of which im-

portant remains are still extant. The city also prospered in the Middle Ages. Many of the churches are of medieval origin, datable to the 10th–14th century but subsequently remodeled and rebuilt, especially in the 18th century. They have a basilican ground plan and campaniles decorated with ancient marbles and polychrome plates of ceramic. Many have been restored. The Church of S. Pietro, which was restored to its original form in 1959, has an interesting crypt and remains of Cosmati pavement. The lower Church of S. Biagio dates from the 11th century; the upper church was added in the 14th century. S. Maria Maggiore was probably erected in the Early Christian period. It retains the façade of the Romanesque reconstruction, with Gothic elements (portal and rose window). The Church of S. Silvestro has a single aisle and a crypt. There are frescoes from the 12th–13th century on the triumphal arch and in the apse. The church preserves a wooden relief of St. Valerius (1138). The Cathedral was reconstructed in the 12th century on the site of a Roman structure that had been transformed into a church. The upper part of the façade and the campanile are all that remain of the Romanesque structure; the rest is a later remodeling. The Cathedral preserves a wooden sculpture of the Deposition (an early-13th-century masterpiece) and a silver reliquary enclosing a triptych of the Saviour between Mary and St. John (11th–12th cent.). The Rocca Pia, a Renaissance fortress, was erected in the 15th century. The most important 16th-century structure is the Villa d'Este, with its terraced gardens, ingenious waterworks, and fountains (IX, PL. 313). Pirro Ligorio built the villa (1550) for Cardinal Ippolito d'Este (VIII, PL. 432). The interior was decorated by followers of the Zuccaris and other 16th-century painters.

Near Tivoli is Hadrian's Villa, constructed between 125 and 135 of our era by Emperor Hadrian, who wished to commemorate his travels by recreating the buildings and objects that had most impressed him in Greece and Egypt. The villa, almost a city in its size and inhabited throughout the Imperial period without any important changes, consists of various groups of buildings arranged with a knowing sense of scenography. The structures are laid out on different levels, according to the disposition of the terrain. The various architectural groups are separated by large areas of green and joined by peristyles, porticoes, and cryptoporticuses. Fountains and pools of water, rich architectural decoration, paintings, mosaics, and reliefs added to the sumptuousness of the villa. Aside from the Greek Theater, the Nymphaeum (presumed Temple of Venus), and the so-called "Palaestra," the remaining edifices can be grouped together in this way: the Poikile, the so-called "Philosophers' Hall," the building with three exedrae, and the nymphaeum formerly thought to be a stadium; the Canopus (III, PL. 386) with the Temple of Serapis, preceded by the vestibule and by the Small and Great Baths and flanked by the Praetorium; the Piazza d'Oro, the Doric Atrium, the Great Peristyle, the Court of the Libraries, the *hospitalia* (rooms for guests), the Imperial Triclinium, and the Pavilion of Tempe; the Odeon, the "Academy," the Tower of Roccabruna; the Island Nymphaeum ("Water Theater"), baths with the *heliocaminos*, the Greek and Latin Libraries, and the barracks of the guards. The hundreds of works of art (e.g., statues and mosaics) found in the villa are preserved in the Capitoline and Vatican Museums, in the Torlonia Collection, in the Galleria Borghese (all in Rome), and in the Louvre and in other museums (VII, PL. 205; X, PLS. 174, 265). Recent archaeological finds are in the Antiquarium di Villa Adriana.

Tuscania. An Etruscan city and later a Roman municipium, Tuscania preserves remains of its ancient walls as well as Etruscan sarcophagi. The city was of particular importance during the Middle Ages. About 1300 the city took the name of Toscanella, but in the 20th century it resumed its ancient name. Examples of medieval civil architecture include numerous squat towers and a few houses with external staircases of the type characteristic of Viterbo, the ruins of the old castle, and the Palazzo del Podestà. Particularly noteworthy are the churches of S. Pietro and S. Maria Maggiore. S. Pietro, flanked by two towers and the ruins of the Palazzo Episcopale, dates to the 8th century but was enlarged and partially reconstructed in the 11th–12th century (restored in 1959). The façade (12th–13th cent.; restored in 1870) has three portals, a loggia, and a large rose window decorated with sculpture and flanked by two twin-arched windows. The interior has three aisles divided by large arches supported by short columns. There are Byzantinizing frescoes in the apse. The crypt has groin vaults supported by columns. Some of the capitals were taken from earlier constructions. S. Maria Maggiore was built toward the end of the 8th century and almost entirely rebuilt in the 12th. The façade has three richly sculptured portals, a small loggia above the central portal, and a large rose window (PL. 176). The interior has a Latin-cross plan with three aisles divided by columns with Romanesque capitals. The ambo was recomposed in the 12th century with 8th- and 9th-century marble work. In the apse is a 13th-century fresco of the Last Judgment. The rectangular campanile also dates from the 13th century. The Church of the Rosa was built in the 14th century and has been remodeled several times. The façade has three portals and a rose window between two Gothic twin-arched windows. The interior has three aisles and preserves a carved wooden altarpiece with scenes painted by Giulio Pierino d'Amelia (16th cent.). The three-aisled Church of S. Maria del Riposo is a Renaissance structure. This church, too, has a carved wooden altarpiece with panels by Giulio Pierino d'Amelia. The Cathedral was built in the 18th century.

Veio (Lat., Veii). This Etruscan city submitted to Rome, after a severe struggle, at the beginning of the 4th century. Of the Etruscan city there remain sections of the walls in ashlar and traces of sanctuaries, including a small temple of the 6th century B.C. on the acropolis, and especially the Temple of Portonaccio (6th–5th century). From the excavations of this temple come numerous architectural terra cottas of the archaic period (V, PL. 38). Particularly interesting are the acroteria in the form of statues, including the famous Apollo of Veio (I, PL. 359). Many small votive statues in terra cotta have been found (V, PLS. 39, 47). There are archaic necropolises around Veio. Particularly noteworthy is the Campana Tomb, which preserves traces of Orientalizing wall paintings (7th–6th cent. B.C.).

Velletri (Lat., Velitrae). This very ancient Volscian city (Velester) was finally conquered by Rome in the 4th century. Remains include traces of an amphitheater, temples, a basilica, and large villas of the Imperial period. A commune in the 12th century, Velletri passed to the Church in the 16th century. Severely damaged during World War II, Velletri preserves few monuments. The Cathedral was built over the ruins of a Roman pagan basilica (perhaps in the 4th cent.; much remodeled in the 13th and 14th). It was restored in 1659–62. The Torre del Trivio (1353) has three stories of double twin-arched windows and one of single-arched windows. The Church of S. Maria del Trivio was completely rebuilt (1622) after a design by C. Maderno. The façade is neoclassic (1840). S. Maria del Sangue (1523–79) is an octagonal structure with simple forms in the style of Bramante. The church may have been built after a design by Alessandro da Parma. S. Martino, mentioned in 1065, was reconstructed on a Greek-cross plan in 1772–78. The Palazzo Comunale was begun by

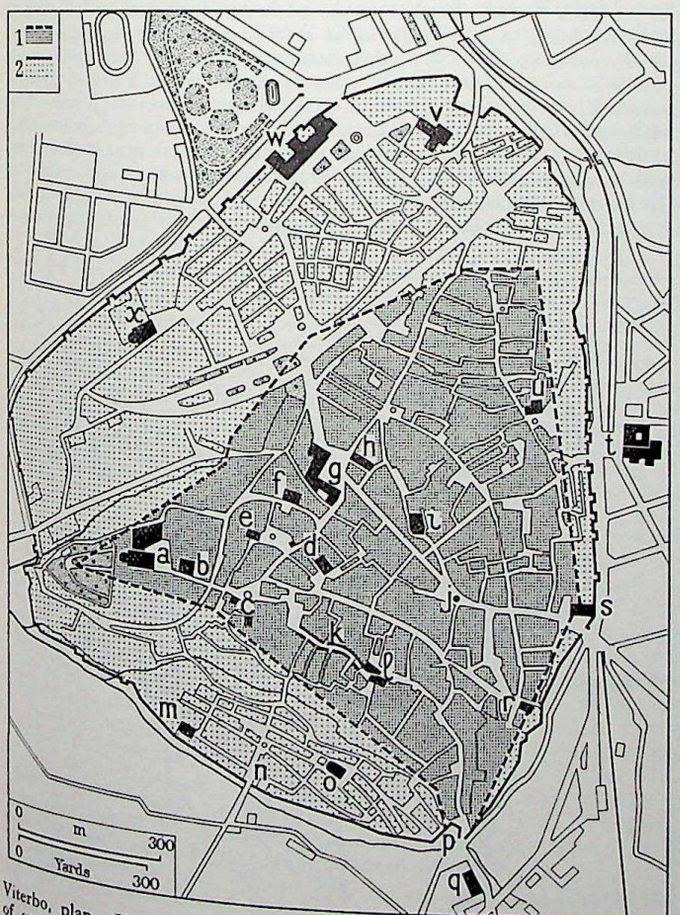
Viterbo (Lat., Viterbium). A small city in Roman times, Viterbo may once have been Etruscan. There are remains of Roman public works (bridges, aqueducts, and baths). A free commune (11th cent.) and residence of the popes, Viterbo enjoyed great prosperity until the 14th century. The city walls date from this period. The S. Pellegrino quarter survives almost intact, with houses of two or three stories, dominated by towers, and equipped with external staircases (*profferli*). Narrow streets of such houses surround the Piazza S. Pellegrino, where the Palazzo degli Alessandri stands (first half of 13th cent.). Noteworthy are the Casa Poscia (14th cent.), the Palazzo di Donna Olimpia, and the Gatti (13th cent.; restored), Capocci, and De Vico palaces. Examples of Romanesque religious architecture include the remains of the Church of the Morte (formerly S. Tomaso; restored). Other noteworthy 11th-century churches are those of the Gesù (formerly S. Silvestro), S. Giovanni in Zoccoli, S. Sisto, and S. Maria Nuova. The Church of S. Francesco was built in 1236 and remodeled in the 14th–17th century. It was severely damaged in World War II and subsequently restored. The church preserves the tomb of Pope Hadrian V, attributed to Arnolfo di Cambio, and that of Cardinal Marco da Viterbo (IV, PL. 455). The former Church of S. Maria della Verità was built in the 12th century, a good deal enlarged in the 14th and 15th centuries, and recently restored. The single-aisled, Latin-cross structure now houses the Museo Civico. The 13th-century Church of S. Pietro has a baroque façade (1622). S. Andrea, founded in the 12th century, has a 13th-century crypt of the Cistercian type. The Gothic S. Maria della Salute has an elegant checkerboard façade and a 14th-century portal with low-relief decoration. The Cathedral dates from the 12th century but was considerably remodeled in the 16th and 17th centuries (restored). The campanile was remodeled in Gothic style in the second half of the 14th century. In the Piazza della Cattedrale is the Palazzo Papale (1257–66) with the adjoining Loggia (1267) and the Romanesque house of Valentino della Pagnotta. Typical of the structures of medieval Viterbo are the fountains, generally set on a polygonal or circular basin with a central shaft: Fontana Grande (Bertoldo and Pietro di Giovanni; 1206–79) and those in Piazza della Morte and Piazza di Fontana di Piano. Renaissance buildings include the octagonal Oratory of S. Elisabetta (or S. Maria della Peste; 1494), in the style of Bramante; S. Giovanni Battista (1515), designed by Bernardino di Giovanni; and S. Maria delle Fortezze (1514), designed by Battista di Giuliano da Cortona (restored). Also of this period are the Palazzo Farnese, in late Gothic style, the Palazzo Chigi (15th cent.), and the Palazzo Santoro (1466). Baroque churches include S. Ignazio (1671), the Pace (1667), and the Gonfalone (1665–1726). S. Angelo in Spata, rebuilt in 1746, incorporates Romanesque remains. To the right of the portal is a Roman sarcophagus (known as the tomb of Bella Galiana). The Museo Civico (in the former Church of S. Maria della Verità) has an archaeological collection and a painting gallery (with works by Sebastiano del Piombo).

Outside Viterbo is the Renaissance Church of S. Maria della Quercia (1470–1525), with a rusticated façade. The cloister has two stories; the lower is Gothic, and the upper is Renaissance.

In nearby Bagnaia is the Villa Lante, completed in 1578 after a design attributed to Vignola. The park has an Italian-style garden and numerous fountains (VIII, PL. 433). In Bomarzo is the Palazzo Orsini (1525–83), in part the work of Vignola. The palace consists of two structures joined by terraces and surrounded by a park with sculptures of imaginary creatures (X, PL. 137). In Caprarola is the Villa Farnese; begun by Antonio da Sangallo the Younger, it was completed by Vignola (I, PL. 388; IV, PL. 191). The salons were frescoed by T. and F. Zuccari (IX, PL. 310).



Viterbo, plan. *Key*: (1) area of the city until the 11th century; (2) area of expansion within the walls, 11th–13th century. Principal monuments: (*a*) Cathedral (S. Lorenzo), Loggia and Palazzo Papale; (*b*) Palazzo Farnese; (*c*) Church and Loggia of the Morte; (*d*) S. Maria Nuova and Torre del Borgognone; (*e*) Church of the Gesù; (*f*) Palazzo Chigi; (*g*) Palazzo Comunale and Palazzo del Podestà; (*h*) S. Angelo in Spata; (*i*) Casa Poscia; (*j*) Fontana Grande; (*k*) Via S. Pellegrino and the medieval quarter; (*l*) Palazzo degli Alessandri and Church of S. Pellegrino; (*m*) S. Carlo; (*n*) Porta del Carmine; (*o*) S. Andrea; (*p*) Porta S. Pietro; (*q*) Church of S. Pietro; (*r*) S. Maria delle Fortezze; (*s*) S. Sisto; (*t*) S. Maria della Verità (Museo Civico); (*u*) S. Giovanni in Zoccoli; (*v*) S. Francesco; (*w*) La Rocca; (*x*) Church of SS. Trinità.

Vulci (Etruscan, Veic-). This powerful Etruscan city was conquered by the Romans in 280 B.C. and later became a municipium. Excavations have revealed walls and gates, the *decumanus*, and a large temple. The civilization and artistic production of Etruscan Vulci can be seen in the objects found in the necropolises (8th–2d cent. B.C.). There are tumulus tombs and chamber tombs (e.g., the François Tomb, with painted walls; IV, PL. 169; V, PL. 52; VII, PL. 260). Nenfro funerary sculpture has been found as well as bronze sculptures and large quantities of imported Greek ceramics (IV, PL. 168; V, PLS. 30, 50, 56, 185, 186; VI, PL. 247; VII, PL. 18; IX, PL. 504; X, PLS. 98, 410). The picturesque Ponte dell'Abbadia is a Roman reconstruction, but the supports of the bridge are Etruscan.

Abruzzi and Molise. These territories, essentially mountainous areas that are rich in prehistoric remains, were inhabited in ancient times by the so-called Sabellian peoples: Sabines, Equi, Marsi, Peligni, Pretuzi, Marrucini, and to the south the large Samnite groups (whence the ancient name of Samnium). There are numerous remains

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

of walls of polygonal masonry, sculpture, and Italic bronzes. A cantonal structure of the inhabited zones and a pastoral economy have always been characteristic of the region; moreover, the Romanization that progressed along the route of the Via Valeria, the Via Claudia Nova, and the Via Caecilia retained significant local features. The Romanesque and Gothic styles of this area also had distinctive accents, a certain provincialism not without rude vigor, especially in the urban churches and the Cistercian abbeys, with their elaborately sculptured ambos. Even today certain traditions of folk art (ceramics, woodworking) have retained an importance consonant with the rustic, self-subsistent character of much of the region.

Alba Fucens (It., originally Albe). This city of the Equi was made a colony by the Romans in 303 B.C., and afterward a municipium. The Roman city, orthogonal in plan, extended over a hill with three summits and into a valley crossed by the Via Valeria. Walls of polygonal masonry, in part contemporary with the establishment of the colony, with sections of irregular work from the Sullan period, are extant. Remains include a Tuscan temple *in antis*, dedicated to Apollo; amphitheater (mid-1st century of our era); theater; cryptoporticus; forum with basilica, market, and baths; shops along the Via dei Pilastri. The town of Albe had become insignificant by the end of the Middle Ages and was destroyed by the earthquake of 1915. Surviving, however, are traces of the façade of the Romanesque church of S. Pietro, with a portal of 1526 and a Cosmatesque ambo, work of the Roman marble artisans identified as Giovanni and Andrea (12th–13th cent.).

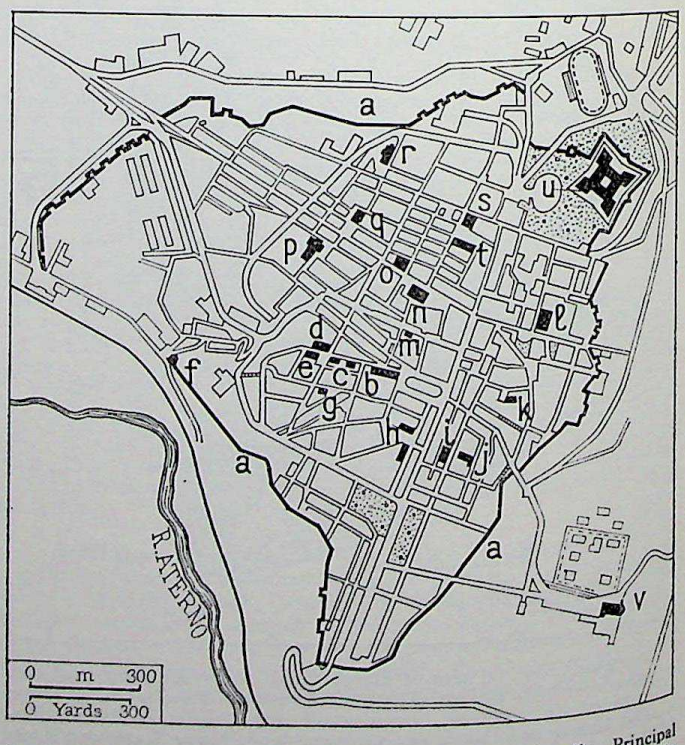
Alfedena (Lat., Aufidena). City of the Caracenian Samnites, in the valley of the Sangro, the site has a necropolis rich in bronzes, as well as walls of cyclopean dry masonry. Remains of the Roman era are also in evidence. The medieval section retains a few houses, ruins of the castle, and the Church of SS. Pietro e Paolo (13th cent.; four aisles, irregular ground plan) and is separated from the modern part of the town. *Museum*: Museo Civico Aufidenate.

Bibliog. C. Mariani, Aufidena, MALinc, X, 1901, cols. 226–638; G. Carocci, Alfedena: Le sue antichità, il suo Museo, Arte e storia, XXI, 1902, pp. 25–26; M. Barosso, L'abbazia di S. Vincenzo Martire alle fonti del Volturno, Palladio, N.S., V, 1955, pp. 164–67; EAA, s.v.

Aquila. The settlement was founded in 1254 and laid out according to a regular checkerboard ground plan. Wars and frequent earthquakes have in part modified the original appearance of the town, which nonetheless reveals the stamp of medieval city planning. Many of its monuments have been restored and reconstructed over the centuries. Outside the city walls is S. Maria di Collemaggio (begun 1287), which has remained almost intact; this structure, typical of the late Romanesque of the region, has a rectangular façade of pink and white dressed stones in geometric designs, three rose windows, and three extremely ornate portals. The three-aisled interior (redone 1706) has paintings by C. Ruthart (17th cent.) and holds the tomb of S. Pietro Celestino by Girolamo da Vicenza (1517). Other Romanesque edifices: S. Flaviano (end of 13th cent.); S. Giusta (1257, remodeled inside); S. Maria di Paganica (1308, greatly restored), with impressive sculptured portals; S. Biagio, with the Camponeschi monument by Gualtiero d'Alemagna (1432); S. Silvestro (14th cent.; interior redone 18th cent.; frescoes of 15th cent.), with a portal in red and white dressed stones. Romanesque portals (lunette of right portal perhaps by Silvestro da Sulmona) remain on the Church of S. Marco (inside are important 15th- and 16th-cent. groups in wood), on S. Marciano, and on S. Pietro di Coppito. Gothic elements occur in the Church of S. Maria di Roio (beginning of 14th cent.) and in the former Church of S. Domenico (1309), which retains the lower part of the façade of the original construction. Of Renaissance origin: S. Bernardino (1454–72), atop a high staircase, with a façade by Cola dall'Amatrice (1527), punctuated by paired columns in three superimposed rows (Tuscan, Ionic, Corinthian), with horizontal crowning and three portals decorated with bas-reliefs by the school of Silvestro da Sulmona (baroque interior of 1674 and 1730, with carved wood ceiling by F. Mosca, who also made the organ); Mausoleum of S. Bernardino (1505) and Maria Pereira tomb (1496), both by Silvestro and assistants with terra cottas by Andrea della Robbia and Silvestro and canvases by P. Cesura; Madonna del Soccorso (outside the walls), with a façade of pink and white stone (1496) and a baroque interior covering the previous ogival structure, containing sculpture of the 15th and 16th centuries; Fountain of the Ninety-nine Spouts (early 15th cent.). Renaissance palaces: Dragonetti (15th cent.); Benedetti, with elegant 15th-century twin-arched windows; reconstruction of the Palazzo di Giustizia over a Gothic structure (1573, B. Marchirolo; restored at various times). Castle: square with bastions at the corners,



Aquila, plan of the city within and outside the medieval walls. Principal monuments: (*a*) Walls; (*b*) Cathedral; (*c*) Palazzo Rivera and Palazzo de Torres-Dragonetti; (*d*) Palazzo Persichetti; (*e*) S. Maria di Roio; (*f*) Fountain of the Ninety-nine Spouts; (*g*) S. Marciano; (*h*) churches of S. Marco and S. Agostino; (*i*) Palazzo Genti; (*j*) S. Giusta; (*k*) S. Flaviano; (*l*) S. Bernardino; (*m*) S. Biagio; (*n*) Palazzo di Giustizia; (*o*) Palazzo Quinzi; (*p*) S. Domenico; (*q*) S. Pietro di Coppito; (*r*) S. Silvestro; (*s*) Palazzo Franchi; (*t*) S. Maria di Paganica; (*u*) Castle; (*v*) S. Maria di Collemaggio.

689

surrounded by a moat (1535, by the Spaniard L. Scriva). Numerous baroque buildings (17th–18th cent.): Oratory of S. Luigi Gonzaga; Church of the Suffragio, with baroque interior, 19th-century dome by G. Valadier (other later decorations by F. Bedeschini and T. Patini); S. Agostino, 18th-century reconstruction by F. Fuga of an earlier Gothic church, much remodeled (elliptic plan topped with an elliptic dome). Baroque palaces: Centi (1766), Franchi (F. Fontana da Accumoli), Manieri, Sardi, Pica Alfieri, Carli, Persichetti (F. Fuga), Rivera, De Torres-Dragonetti, Antonelli. Damaged by earthquake at the beginning of the 18th century, the Cathedral was reconstructed in 1703, thereafter restored at various times. *Museums*: Museo Nazionale d'Abruzzo; Museo Diocesano.

Atri (Lat., Hatria Picena, Hadria). On a height with a view of the coast, this city of the Picenes was Romanized in the 3d century B.C. (graffiti vases and bronze furnishings of the 7th–5th cent. B.C., remains of Roman temple, architectural terra cottas). In the Middle Ages the site was the domain of the Acquavivas. Characteristic of the local architecture of the Romanesque-Gothic epoch are various churches with rectangular ground plan, no apses, and lunette vaults. The Cathedral (13th–14th cent.) has a rectangular façade with decorated portal and rose window (Rainaldo, 1302), as well as three portals on the right side. Worthy of note is the quadrangular bell tower with a polygonal cuspate crowning, the archetype for the bell towers of the province. The interior (three aisles) displays frescoes by A. Delitio (15th cent.); the crypt below (five aisles, 8th cent.?) is perhaps a Roman swimming pool transformed and has remains of frescoes. Nearby is a 14th-century cloister, along with a rich treasury and archives. S. Agostino (14th cent.) bears a rectangular façade from about 1470, with the portal attributed to Andrea Lombardo; the polygonal apse has decoration in terra cotta. Also extant are remains of S. Nicola di Bari (13th cent.), S. Andrea, and S. Domenico (14th-cent. façade, baroque interior). The Palazzo dei Duchi (14th cent.), erected over Roman pools, has a façade of Renaissance type constructed in the 18th century. There is a museum attached to the Cathedral.

Gavini, Studio sull'architettura d'Abruzzo, Rass. d'arte degli Abruzzi e del Molise, IV, 1915, pp. 1–75; EAA, s.v.

Campobasso. The area retains traces of the pre-Roman city walls and the Norman walls (11th–13th cent.), as well as Romanesque elements in some of its churches (S. Bartolomeo, S. Giorgio). Survivals of Gothic architecture (14th–15th cent.) are found in the Church of S. Leonardo and in the S. Cristina and Mancini portals, the only remnants of the 14th-century walls. Of the reconstruction carried out by Nicolò Monforte after the earthquake of 1546, there remain the castle (1549) and ruins of the double circuit of walls, once united by arches and vaults for support. One or two small towers and the Porta S. Antonio record the defensive apparatus of the Aragonese (16th cent.). The lower city took form in the 17th and 18th centuries, with its late baroque houses and palaces. Nineteenth-century structures include the neoclassic Cathedral (SS. Trinità, 1829, B. Musenga), the Collegio M. Pagano (1800), and public buildings. The Museo Sannitico has archaeological and medieval objects.

In the vicinity is S. Maria della Strada, an early Benedictine abbey with a small church of the 12th century.

Bibliog. E. V. Gasdia, Sancta Maria de Strada, Riv. storica benedettina, XVI, 1925, pp. 29–67, XVII, 1926, pp. 35–55; G. Matthiae, Architettura medievale nel Molise, BArte, XXXI, 1937–38, pp. 93–116; A. Mancini, Castelli molisani, I: Il Castello di Campobasso, Campobasso, 1942.

Carsoli (Lat., Carseoli, Carsioli). Town of the Equi and a station on the Via Valeria, 42 miles from Rome. A Latin colony from 302 to 298 B.C., it then became a municipium. On the site are traces of walls in ashlar work of tuff, the podium of a temple, and remains of various other edifices. A group of votive offerings of the 3d–2d century B.C., with heads in Italic style, is also present. Destroyed by the Saracens, the town was rebuilt at the present site and became a fief of the Orsini family and then of the Colonnas. Noteworthy as well are the remains of the donjon of the Angevin castle (1293); the Palazzetto Orsini (13th cent.), with ogival twin-arched and Guelph windows; numerous houses of the 15th century; and a parish church of the 16th century.

Bibliog. P. Piccirilli, La Marsica: Appunti di storia e d'arte, Napoli nobilissima, XII, 1903, pp. 148–56; G. J. Pfeiffer and T. Ashby, Carsioli, Sup. Pap. Am. Cederna, Teste votive di Carsòli, AC, V, 1953, pp. 187–209; EAA, s.v.

Chieti (Lat., Teate Marrucinorum). Overlooking the right bank of the Pescara, this principal city of the Marrucini became a Roman municipium after the Social War. It was crossed by the Via Valeria (Corso Marrucino), which determined its development and its preeminent position among the Marrucinian centers. The high zone (Civitella) retains the ancient octagonal plan. Interesting Roman remains include a theater (second half of 1st cent. of our era); three temples on a high podium; and large cisterns connected with the baths, built in the early Imperial era and later enlarged. Destroyed by the barbarians and reconstructed by the bishop Theodoric I, the city became a Lombard "gastaldia" and then the seat of a Norman count. The Cathedral (11th cent.?) has been reconstructed along medieval lines after earthquake damage (20th cent.); its crypt is decorated with baroque stuccoes (traces of 11th-century masonry can be seen); the bell tower is without cusp (begun 1335, B. di Giacomo; finished 1498, A. da Lodi). Of the early Gothic period are Porta Pescara and the Church of S. Agata, as well as remains of S. Francesco della Scarpa and S. Agostino. Built in full Gothic style during the 14th century were S. Maria della Civitella (ca. 1320) and S. Antonio. The present Church of S. Maria del Tricalle (remodeled in second half of 15th cent.) is a Renaissance building with central ground plan. The towered Palazzo Arcivescovile (1480; remodeled) is decorated with polychrome plates. S. Giovanni and S. Chiara provide examples of the baroque of the area. Northeast of the city has risen the modern industrial and commercial quarter of Chieti-Scalo. The Museo Nazionale di Antichità is the repository for archaeological material of the region (among the most important are the statue of a warrior from Capestrano, the reliefs of L. Storax, and the bronze bed from Amiternum). Other collections are found in the Pinacoteca Municipale and the Museo Diocesano Teatino.

In the vicinity is the Cistercian Gothic Church of S. Maria Arabona (1208). Mutilated in its forward section, the church has three aisles divided by compound piers and a rectangular apse flanked by chapels; the ciborium and paschal candlestick are of the 13th century. Adjacent are the remains of the monastery.

Isernia (Lat., Aesernia). The town was first a Samnite center, a Latin colony from 263 B.C., and finally a municipium. From Roman times there are remains of polygonal walls, a bridge, and the foundation of an Italic temple under the Cathedral. Subjected to repeated devastation, the area has preserved few medieval monuments: Romanesque portal and bell tower (1015) of the destroyed Church of S. Maria delle Monache, with adjoining convent; the Cathedral, redone in neoclassic style (1837) over the earlier Gothic base. The Museo Civico, in the former convent, houses an archaeological collection.

Lanciano (Lat., Anxanum). In the upper valley of the Feltrino, the town comprises an ancient nucleus on a hill, to which a modern quarter has been added on the plain below. The principal city of the Frentani, perhaps the Samnite Frentrum, it then became a Roman municipium. Tombs of the Iron Age have been revealed, as well as

the aqueduct and theater from Roman times. Inside the massive city walls (11th cent., many times renovated) the following monuments are to be found: the former Romanesque Church of S. Biagio (12th cent.), with bell tower of 1340; S. Agostino (1270), a Gothic structure with portico; S. Francesco and S. Lucia (13th cent.), Gothic, the latter with a 14th-century portal; S. Maria Maggiore (1227; remodeled in later centuries), also Gothic, with a fine portal (1317; F. Petrini); Cathedral (S. Maria del Ponte), built in 1389 on the four arches of the Bridge of Diocletian, redone in the 18th century, with unfinished neoclassic façade, portico, terrace, and freestanding campanile (1614).

Not far away is S. Giovanni in Venere, originally of the 8th century, reconstructed in 1165 and remodeled in the 13th century in Cistercian Gothic style (restored after 1945). The church has a portal from about 1230, an apse with arcades bearing Islamic-style polychrome decorations, a raised presbytery, a crypt, and frescoes executed in the 12th century. The adjacent cloister has been restored, but the monastery is in ruins.

Pescara (Lat., Aternum). Port of the Vestini, Marrucini, and Peligni, Pescara was devastated by the Goths and the Lombards; during the Middle Ages it flourished again, centered about the castle, but was destroyed in 1209 by Otto IV and then reconstructed early in the 15th century by Ladislas I, King of Naples. The scene of struggles between the Angevins and the Aragonese, the area finally became the fief of the De Avalos. No monuments have been preserved from these periods, except for remnants of defensive works erected by Charles V (dismantled in 1867). Since 1927 the two adjoining towns of Pescara and Castellamare Adriatica have been united. Seriously damaged by the bombings of 1943–44, the city has risen again in line with modern architectural planning. Notable are its new industrial and port installations and the stadium, by L. Piccinato. The house of Gabriele d'Annunzio, maintained by the city, holds a collection of objects and photographs relating to the life of the writer.

San Clemente a Casauria. This abbey, built in the 9th century on a small island in the Pescara River near Torre de' Passeri, is presently situated at a bend in the river. In the 10th century it was sacked by the Saracens and in the 11th by the Normans. Reconstructed in the 12th century, the abbey was again damaged in the 14th century and also in the 20th by earthquakes (restored 1920 and 1934). The church (1176–82; restored after 1945), one of the most successful buildings in the Cistercian transitional style between Romanesque and Gothic, is preceded by a portico composed of three arches and roofed with ribbed vaults. There are three sculptured portals; the central one is closed by a bronze door with figures of abbots and monks (1191). The interior has three aisles divided by piers, a slightly projecting transept, and a semicircular apse and retains its very early pulpit, the paschal candlestick, and ciborium. The altar is formed of an Early Christian sarcophagus; the dome has groin vaults on antique columns. In the crypt is a double apsidal enclosure, with the exterior part dating from the 9th century. Adjoining the church is the Museo Casauriense.

Sulmona (Lat., Sulmo). A city of the Peligni located at the center of the large Peligna Valley — and the birthplace of Ovid — Sulmona became a municipium after the Social War. A section of polygonal walls, Italic and Roman necropolises, and a theater and amphitheater survive from this epoch. The city was quite important during the Middle Ages, when it was a Lombard "gastaldia" and then successively a Swabian and Angevin possession. The Romanesque Cathedral (S. Panfilo, 9th cent.; restored ca. 1075–1120), many times destroyed by fire, retains a Gothic portal, Romanesque colonnades inside, a triapsidal crypt of the 11th century (with 12th-cent. cathedra), and a baroque interior. From the Church of S. Francesco della Scarpa, a Gothic structure erected in 1290 (ruined by earthquakes), there remain an imposing portal atop a staircase and remnants of a side wall. A large aqueduct (1256) with pointed arches is a relic of the medieval water system. The Porta Napoli (14th cent.) provides the oldest testimony of the urban renovation of the 14th and 15th centuries. Of the complex of the Annunziata (14th–18th cent.) there remain the palace, constructed in various stages (portals of 1415, 1483, 1522), revealing a fusion of Gothic and Renaissance elements; the church, reconstructed in 1710, perhaps after a design by P. Fontana, over a previous late Gothic building; and the 16th-century bell tower. The 15th-century constructions that survive include the Church of S. Maria della Tomba, its 15th-century façade with a horizontal crowning and ogival portal (remodeled, including the interior); Fontana del Vecchio (1474); Convent of S. Lucia; Convent of S. Chiara, with cloister of 1518; the Palazzi de Sardi (1420), della Sanità (mid-15th cent.), Tabassi (with portal by Pietro da Como, 1449), and Tironi (or de Petris, with later additions). Somewhat later are the Palazzi delle Palle, Colombino, Faciani, and della Banca Agricola. Baroque architecture left its mark on many secular buildings. *Museums*: Museo Civico, in the Palazzo dell'Annunziata (goldwork); Museo della Cattedrale (sacred art).

Outside the city is the old Morronese abbey (Sto Spirito), near the so-called "Ovid's Villa," with an abbey church transformed in the 18th century, and the Oratorio di S. Onofrio (12th cent.), with frescoes by Gentile da Sulmona. On the slopes of Mount Morrone is a large cult complex dedicated to Hercules Curinus.

Tagliacozzo. On a height dominating the valley of the Imele, the town was perhaps founded by the Goths. A fief of the Orsini family (1255–1497) and then of the Colonnas, Tagliacozzo has preserved monuments of both the Gothic and the Renaissance periods: S. Francesco (1233), single aisle, rectangular façade ornamented with a 15th-century portal and rose window, baroque interior; SS. Cosma e Damiano (15th cent.), with portal (1452) by the Lombard Martino da Biasca; S. Maria del Soccorso (end of 15th cent.), with a portico of 1542; Palazzo Ducale (14th–15th cent.), with a Renaissance portal and an architraved loggia on the left side, and Renaissance frescoes attributed to G. d'Atri; Palazzo Argoli-Ruota (15th cent.).

Teramo (Lat., Interramnia Praetuttiorum). City of the Pretuzi, Roman municipium, and then a colony; the site has a necropolis antedating the 5th century B.C. Other remains of its antique history include a theater, an amphitheater, and a group of tombs along the road to Amiternum (1st cent. of our era). After being destroyed several times during the barbarian period, Teramo had a great flowering under the Angevins (12th–14th cent.) but declined again at the end of the 14th century, for from the 15th century onward its fortunes reflected the vicissitudes of the Kingdom of Naples. The old nucleus of the city retains the early ground plan, traces of the walls and of medieval seignorial palaces, the ruins of the Church of S. Maria Interamnensis (6th–8th cent.), and the site of S. Getulio (S. Anna dei Pompetti, 12th cent.), the only remnant of the old cathedral (burned ca. 1155). The present Cathedral, with rectangular crenelated façade, has a Gothic portal decorated with mosaics and reliefs by Deodato di Cosma (1332) and a bell tower from the late 12th or early 13th century. It retains some parts of the original construction (1158). The interior, in part Romanesque and in part Gothic, counts among its furnishings a silver altar frontal by Niccolò da Guardiagrele (1433–48) and a polyptych by Jacobello del Fiore (early 15th cent.). S. Francesco (13th–14th cent.), a Romanesque-Gothic edifice that preserves part of its original structure, was extensively remodeled in the late 16th century. There is a local museum.

Termoli. On a rocky promontory of the Adriatic coast, the town consists of a medieval nucleus with narrow streets and an adjacent zone (Borgo) having a regular pattern of wide streets. The Cathedral (S. Basso) was erected during the 12th century in the Pisan-Apulian variant of Romanesque, over earlier constructions, and was remodeled from the 13th to 15th century. The façade is punctuated with a series of recessed blind arches that continue along the right side, a portal with reliefs, and a 12th-century rose window. The three-aisled interior has been completely redone, and the crypt is a modern construction that incorporates sections from the 6th and 7th centuries and remnants of the old mosaic pavement (10th–11th cent.). In the adjoining bishop's residence, there are fragments of a Romanesque pulpit. The defensive installations of the port, constructed by Frederick II (1247), have been reduced to a large tower and a section of the walls with small cylindrical towers.

Campania. The name is derived from the Campani, the inhabitants of ancient Capua. In the Iron Age the region was colonized by the Greeks and Etruscans, and in the 5th century B.C. it was occupied by the Samnites, who were known there as Opici and Osci (Oscans); later it came into Roman possession. The preservation of archaeological evidence of these ancient civilizations is truly unique, since a number of cities (Pompeii, Herculaneum, Stabiae) were buried by the eruption of Vesuvius in A.D. 79. In the Early Christian and Byzantine periods the Campanian cities continued to flourish. A period of great prosperity from the 11th to the 13th century was particularly noteworthy in architecture, in which Romanesque and Arabo-Norman elements were fused with local classical traditions. The establishment of the Angevin kingdom in the 13th century and of the Aragonese dynasty in the 15th brought an influx of Italian, French, and Spanish Gothic elements. Naples gradually became the center of artistic activity, and it remained the cultural and artistic capital until modern times; it was particularly important during the Renaissance and in the baroque period. In the 15th century, Flemish and Tuscan influences were strong, and later Spanish and French elements appeared. The art of the 18th and early 19th centuries was linked with the Bourbon court culminating in the construction of the royal palaces of Caserta and Capodimonte.

Amalfi. Of early medieval origin, and under Byzantine rule in the 6th century, it was sacked by the Lombards in the 8th, and in the following two centuries became a powerful maritime republic, maintaining close relations with the East. After it was attacked and defeated by Pisa in 1137, the power of Amalfi declined. Later the city became a fief of various noble families. The Cathedral is of early medieval origin, and excavations have revealed parts of the initial structure. It was rebuilt in 1203 in Romanesque style and, after various other changes, remodeled in baroque forms in 1701–31. Of the Romanesque structure there remains only the campanile (restored); decorated in polychrome, it has four small turrets of Arab derivation. The general plan of the Cathedral is that of the Romanesque construction: it is divided into a nave and two aisles and has three apses, a raised presbytery, and a crypt. The stairway, porch, and façade are 19th-century reconstructions after the presumed 13th-century design. There are a few remains of Romanesque decoration on the façade and some Romanesque sculpture in the portals. The bronze doors of the central portal, decorated with crosses and inlaid figures, were cast in Constantinople before 1066. (The Church of S. Salvatore de Bireto in the neighboring town of Atrani has similar doors, cast in 1087.) Of the 12th- and 13th-century Romanesque interior furnishings there remain two columns, two candelabra, and two rebuilt ambos decorated with mosaics. The adjoining cloister (Chiostro del Paradiso) has paired columns supporting arches of the Arabic type, ornamented with stucco (1266–68). The Convento dei Cappuccini (converted into a hotel) retains the original cloister with interlacing arches. The remains of the Arsenale della Repubblica comprise a two-aisled structure with an ogival roof supported by 10 piers. The Fontana di S. Andrea (or del Popolo) was built in 1760. The monument to Flavio Gioia by A. Balzico dates from 1926.

Baia (Lat., Baiae). As a thermal center Baia enjoyed great popularity in late republican and imperial times. Of particular importance are three large domed halls, the earliest of which dates from the late 1st century B.C. and is known as the "Temple of Mercury." Five bath complexes have been identified and may be assigned to the 1st–4th century. Much sculpture has been discovered here.

Bibliog. A. Maiuri, Terme di Baia, BArte, XXXVI, 1951, pp. 359–64; A. Maiuri, I Campi Flegrei, 3d ed., Rome, 1958; M. Napoli, EAA, s.v. Baia, I, 1958, pp. 960–62 (bibliog.); F. Rakob, Litus beatae Veneris aureum: Untersuchungen am "Venustempel" in Baiae, RM, LXVIII, 1961, pp. 114–49.

Benevento (Lat., Beneventum). This ancient town of the Irpini was originally called Maleventum, or Maluentum (first mentioned 297 B.C.); its name was changed to Beneventum when the Romans made it a colony in 268 B.C. Notable ancient monuments have survived, including a theater of the 1st century of our era and the great triumphal arch of Trajan (IX, pl. 161; X, pl. 154), decorated with reliefs depicting events in the life of the Emperor. There are many figures of deities and animals in Egyptian style (Mus. del Sannio), as well as an obelisk from the time of Domitian, all from a Temple of Isis. In the Middle Ages Benevento prospered markedly under the Lombards. During their hegemony the city was surrounded with walls, from which the Torre della Catena and Porta Arsa remain. Rule of the city was subsequently disputed between the Normans and the Church, until in 1077 the Church gained the ascendancy.

Of S. Ilario di Porta Aurea (7th cent.), only the semicircular apse remains. S. Sofia, a church connected with a Benedictine convent, was constructed in the 8th century (restored after an earthquake in 1688). The octagonal interior has retained the original Byzantine plan: pairs of reused columns form a hexagon within the octagon and support a dome on a drum; the vaulted ceiling was rebuilt in the 17th century. The church contains some notable frescoes of the 10th–12th centuries. The adjoining 12th-century cloister has horseshoe arches of Arabic derivation and capitals carved in the manner of Antelami. The Cathedral, founded in the 7th century, originally comprised only the nave; two side aisles were added in the 11th century and two more in the 12th. Almost completely destroyed in 1943, it was rebuilt (completed 1959) with the original materials. The 13th-century façade has survived intact; it shows Apulian influences, with a blind arcade and loggia above. The jambs and the architrave of the central portal were carved by Master Rogerius. The bronze doors (13th cent.; restored 1693 and later) are decorated with figures and ornaments in a Byzantine style that shows Arabic

influence. The campanile (1279) is decorated with Roman reliefs. The Rocca dei Rettori (Castle; 14th cent.) overlies the Lombard fortress. The Palazzo Municipale was constructed in the 16th century (restored 19th cent.). Eighteenth-century structures include the Church of S. Bartolomeo, the baroque Fontana delle Catene, and the Vanvitelli bridge (an older bridge enlarged and restored by Luigi Vanvitelli). The Church of the Madonna delle Grazie (1839), with hexastyle porch and Greek-cross interior, and the Teatro Vittorio Emanuele II (1851–62) by Pasquale Francesconi are neoclassic in style. The Museo del Sannio (in the convent and cloister adjoining S. Sofia) contains archaeological and medieval material.

Calvi Risorta (Lat., Cales). Originally a center of the Aurunci, Cales was conquered by the Romans in 332 B.C. and was destroyed by the Saracens in 879. It was famous in the Hellenistic period for its black-glazed terra-cotta vases (Calene ware). Remains from the ancient period include a stretch of the Roman walls, a temple on a podium, an amphitheater, and a theater (1st cent. B.C.). The 9th-century Cathedral (restored 1452) has a Romanesque blind arcade on the façade and three well-preserved Romanesque apses. Inside are an episcopal throne and a mutilated ambo (12th cent.), with sculptured and mosaic decorations; the crypt is supported by reused Roman columns. The 9th-century castle, built on a square plan with cylindrical corner towers, is largely in ruins.

Nearby is the Grotta dei Santi, an artificial cave with a semicircular raised apse and votive frescoes of the 10th and 11th centuries. The Grotta delle Formelle has similar frescoes.

Capri (Καπρέαι; Lat., Capreae). A mountainous island in the Bay of Naples, Capri has been inhabited since prehistoric times (neolithic pottery found in the Grotta delle Felci). It was colonized by the Greeks (remains of the polygonal walls) and later served as a Roman imperial residence. A villa built by Augustus (enlarged in the time of Tiberius) lies west of Marina Grande; the Villa Iovis was constructed by Tiberius on the eastern promontory; another villa of Tiberius was near the Torre di Damecuta.

The architecture seen at Capri and Anacapri is of a Mediterranean type, incorporating Roman, Byzantine, and Arab elements. The houses are plain, whitewashed structures with arcaded loggias and terraced or convex roofs. The churches, also of this simple type of architecture, include S. Maria del Soccorso, S. Anna (13th cent.), and S. Maria Cetrella (14th cent.). S. Costanzo (ca. 11th cent., enlarged 14th cent.), at Marina Grande, has the form of a Greek cross inscribed within a square, with a small central dome; late Byzantine forms are combined with Arabic elements. Late Gothic influences fused with Byzantine forms appear in the Chapel of S. Michele (on the slopes of Mt. Tiberio) and in two churches of Anacapri, S. Maria di Costantinopoli and S. Cataldo. The Certosa di S. Giacomo (1371–74) presents a local adaptation of Gothic; restored to its original form, it is a single-aisled church with an ogival groined vault and adjoins a small 15th-century cloister and a larger 16th-century one, around which are the monks' cells. Local character also prevailed in the architecture of the baroque period, as seen in the Church of S. Stefano, rebuilt about 1683 by Francesco Antonio Picchiatti, and in S. Salvatore (1685), by Dionisio Lazzari, with the adjoining Convento delle Teresiane (1678). The Church of S. Michele (1719) at Anacapri, by Domenico Antonio Vaccaro, is octagonal. The floor, of glazed tiles, was made by Leonardo Chiaiese (1761) from designs by Francesco Solimena.

Capua (Lat., Casilinum). The present city was founded in 856 by fugitives from Capua Vetere. In the 9th century it came under Lombard rule, and in the 11th it was conquered by the Normans. It was subsequently besieged and sacked several times, and suffered much damage during World War II. In the early period, access to the city from the Via Appia was provided by the Roman bridge (restored 12th cent., destroyed during World War II, and since rebuilt). It is hogback in form, with five spans, and at the far end are the bases of the towers of a gate, built by Frederick II in the 13th century. Most of the Lombard and Norman churches have been remodeled or rebuilt. The Cathedral, founded in 856 and reconstructed in the 12th century (destroyed in World War II and rebuilt), is entered through a porch supported by 16 ancient columns with Corinthian capitals. Inside is a carved paschal candlestick of the 13th century. The massive campanile is of the 9th century. S. Michele a Corte (9th cent.), S. Giovanni a Corte (10th cent.), and S. Salvatore Maggiore a Corte (10th cent.) have been substantially remodeled, and little remains of the original structures. S. Marcello Maggiore (9th cent.) has a 12th-century carved portal showing Lombard influence. The Palazzo dei Principi Normanni (or Castello delle Pietre), from the Norman period, still has one rectangular crenelated tower. The ogival portal of the Palazzo Fieramosca, reconstructed during the Renaissance, is of the 14th century. Several Gothic portals of the Durazzo type date from the 15th century, including one in the Palazzo Antignano; the Porta Napoli, exhibiting the Tuscan Doric order, is of the same century. Sixteenth-century structures include the Palazzo del Municipio, its façade decorated with carved heads from the Roman theater of ancient Capua; the Church of the Annunciata (late 13th cent., rebuilt 1531–74), with a dome by Domenico Fontana; and the campanile of S. Eligio. The Museo Provinciale Campano, in the 13th-century Palazzo Antignano, contains archaeological material, medieval sculpture, and paintings.

About 3 miles east of Capua is the Church of S. Angelo in Formis, built sometime before the 10th century and reconstructed in 1073 by Desiderius of Montecassino, on the site of a temple of Diana Tifatina (traces of the ancient mosaic pavement). It is basilican in form, modeled after the Abbey Church of Montecassino, and is entered through a frescoed porch (12th–13th cent.). The portal, classical in form, is surmounted by a lunette with frescoes of the 11th century. The interior preserves a cycle of 11th-century frescoes. The massive campanile, detached from the church, is partly built with material from the Roman amphitheater.

Caserta. This modern city, of gridiron plan, developed in the 18th century when the Royal Palace (I, pl. 389) was built for Charles III, Bourbon king of Naples. Luigi Vanvitelli designed the palace and supervised the construction from its inception in 1752. After his death in 1773, his son Carlo altered the design. The structure is rectangular in plan, with the façades divided horizontally into two bands of two stories each. On the upper level the center and end sections, which project from the main body of the façade, are decorated with pilasters and semicolumns of giant order. The interior space is divided into four rectangular courtyards by two wings intersecting at right angles. A monumental staircase (pl. 226) leads to an octagonal vestibule opening onto the royal apartments, with many rooms decorated with stuccowork and frescoes in neoclassic style, and onto a rectangular chapel; the latter has a wide apse, is covered with polychrome marble, and contains works by Giuseppe Bonito, Sebastiano Conca, and Anton Raphael Mengs. The neoclas-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

sic theater (1769) is reached through a courtyard. The great park (PL. 441), designed by Vanvitelli, is a monumental complex of picturesque fountains, sculpture, pools, and waterfalls. At the far end is the English garden (1782), designed by the British landscape architect John Andrew Graeffer. Other works by Vanvitelli are the so-called "Castelluccio Reale" (an octagonal miniature fortress; X, PL. 267), the fish pond, and the Caroline aqueduct.

Caserta Vecchia, about 3 miles northeast of Caserta, founded by the Lombards in the 8th century, has retained its medieval character. The Cathedral (12th cent.) is Romanesque, with Apulian and Arabo-Sicilian elements. The exterior (PL. 175) is decorated with interlaced blind arches and polychrome ornaments of glazed terra cotta. The interior, a Latin cross surmounted by a high dome, comprises a nave and two aisles, divided by reused ancient columns; there is a single rectangular apse. The floor of the presbytery had remains of a figured mosaic; the pulpit has mosaic decoration of the 12th century. The 13th-century companile rests on a Gothic archway. The Church of the Annunziata is a small Gothic structure of the 13th century. Of the 9th-century castle, only the keep remains.

Between Caserta and Caserta Vecchia is the Church of S. Pietro ad Montes, built with material from ancient Roman buildings and similar in plan to S. Angelo in Formis (12th-cent. frescoes).

Castellamare di Stabia (Lat., Stabiae). Originally an Oscan settlement, it was destroyed by Sulla during the Social War; later many villas were built, but these were buried by the eruption of Vesuvius in A.D. 79. Of the city proper, only the Temple of the Genius Civitatis and a necropolis (7th–3d cent. B.C.) are known. On the Varano Plateau are remains of country houses and villas of urban type, two of which have elaborate decorations in Pompeian Style IV. The town was abandoned during the barbarian invasions in the 6th century, but in the 9th the Castrum ad Mare de Stabiis was built on the site (hence the modern name). Castello Angioino, of the 9th century, is so called because it was enlarged by Charles I of Anjou (1266). The Grotta di S. Biagio is decorated with votive frescoes by various 11th- and 12th-century artists. On the outskirts of the town is the Villa Quisisana, built by Robert of Anjou in 1310 (converted into a hotel); it served as a royal residence until the end of the Bourbon dynasty. The Cathedral dates from the second half of the 16th century (remodeled 1875–93), and the Church of the Gesù is from 1615. The Cathedral has an Antiquarium.

Cava dei Tirreni. A town of very early origin, in 1058 it was donated by Gisulph, Prince of Salerno, to the Abbey of Trinità. In a dominant position nearby is the Abbey of Trinità della Cava, founded by St. Alferio Pappacarbone in 1011. It grew in importance, eventually administering the Cava congregation of 500 abbeys, including the great Benedictine abbey of Monreale. The Trinità complex was rebuilt in the 18th century, but the 13th-century cloister, with Roman and medieval sarcophagi, survives. Other medieval sections are the Gothic chapter house, the Chapel of the Crucifix (with a relief by Tino di Camaino), and an 11th-century burial crypt. The subterranean Chapel of S. Germano is decorated with 14th-century frescoes. The new chapter house (restored 18th cent.) has a noteworthy floor of glazed terra-cotta tiles (1600), and 16th-century carved and inlaid wooden choir stalls. The church, remodeled in the 18th century, retains an ambo and an Easter candlestick with mosaic decoration from the 12th century.

Cimitile. This city occupies the site of an Early Christian *coemeterium* (remains of frescoed arcosolia and tombs), the burial place of St. Felix, first bishop of the nearby city of Nola. In the 4th century it became one of the most venerated sites in the region, and from 394 to 410, St. Paulinus of Nola established a *monasterium* there, with basilicas, chapels, and hospices. It began to decline in 410, when it was sacked by Alaric. Excavations have been conducted, but the exact identification of the various components is difficult, because some of the buildings were erected over older ones. The earliest churches (before 394) are SS. Martiri, S. Calionio (both single-aisled with an apse), S. Tommaso (rebuilt 18th cent.), and S. Stefano (rebuilt 19th cent.). S. Felice (365–84), originally comprising a tripartite nave and an apse, was lengthened by the addition of another apse, at the opposite end of the nave (5th cent.). The most important church constructed by St. Paulinus is the Basilica Nuova, adjoining S. Felice; both churches are almost completely below ground, with the Church of S. Felice in Pineis built over them. The Basilica Nuova contains the sarcophagi of St. Felix the Younger and of St. Paulinus the Younger, vestiges of nonfigural mosaics, frescoes (4th–5th cent.), and sculpture (9th–11th cent.). In the 14th century the trilobate arcaded apse of the basilica was incorporated into the Church of S. Giovanni (remains of 14th-cent. frescoes). Other structures built by St. Paulinus include a fifth church — of which some 14th-century frescoes remain — whose apse was decorated with nonfigural mosaics. The titulus of this church is preserved in a letter of St. Paulinus. The porticoed Cappella dei Martiri (8th cent.) has frescoes of the 10th–12th century within. S. Felice in Pineis is entered through a quadriporticus. Surmounted by a stepped dome, the interior has remains of frescoes and sculpture (9th–14th cent.).

Cumae (Κύμη). A site inhabited in the Iron Age, Cumae was colonized by Greeks from Chalcis and Eretria about the mid-8th century B.C. It served as a center from which Hellenic civilization spread through central Italy, and especially prospered during the archaic period. Here was the seat of the renowned Cumaean sibyl. Conquered by the Samnites about 402 B.C., Cumae nonetheless remained an important town until the Middle Ages.

The ancient center occupied a hilly area between the acropolis and the summit of Mt. Grillo, and here have been found remains of the Greek walls and of the acropolis from the Samnite period. A series of passages connected the forum with the harbor on the west and the town with Lake Averno, site of a Roman military port (Portus Julius). The ruins of the Temple of Apollo lie on a lower terrace of the acropolis; the stylobate is part of the Greek structure, while other remains are from the reconstruction in the time of Augustus. On the summit of the acropolis is the Temple of Jupiter (same dates), transformed into a Christian basilica (5th cent.). Also on the acropolis is the Cave of the Sibyl, with an early Greek dromos and an inner chamber of the Hellenistic-Roman period. In the forum are a portico built of tuff (1st cent. B.C.) and a temple on a podium of Samnite origin, remodeled in the Flavian era. In the lower part of the town two baths have been identified. Beyond the walls, to the south, is an amphitheater of the republican period. The necropolis was used from the Iron Age until the Roman imperial period.

Bibliog. E. Gabrici, Cuma: Dalle origini ai principii del secolo VI a. C., MALinc, XXII, 1913, cols. 1–448; A. Maiuri, Nuovi saggi di scavo a Cuma, Campania romana, I, 1938, pp. 9–15; A. Maiuri, I Campi Flegrei, 3d ed., Rome, 1958; W. Johannowski, EAA, s.v. Cuma, II, 1959, pp. 970–73.

Herculaneum. This ancient city was perhaps first settled by the Oscans, then was occupied by the Etruscans, and afterward by the Samnites; later it became a Roman municipium. Situated at the foot of Vesuvius, it was buried by the eruption of A.D. 79. Excavation and restoration began in the 18th century, below the present-day village of Resina. The city is rectangular in plan, with blocks whose length is twice the width. Among the most important monuments is the theater built by Augustus and later emperors, where much sculpture has come to light. Near the forum is a bath of the early Augustan period, with decorations from the time of Claudius or Nero. There is also a large gymnasium. The Samnite House (3d–2d is of cent.) particular interest for its impressive atrium.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

The House of the Bicentenary is of the Augustan Era. The House of the Stags, dating fron the reign of Nero, differs in plan from the other houses: it is built around a courtyard, with a cryptoporticus and porticoes facing the sea. The House with the Mosaic Atrium is similar in plan, with a three-aisled tablinum. The Trellis House, a multifamily dwelling, is worthy of note for its use of wooden laths in the masonry (*opus craticium*) and for the common court and well that served its residents. Of great interest are the wooden furnishings of the houses (V, PL. 429). The painted wall decorations are mostly of Styles III and IV (PL. 424; VII, PL. 214; X, PL. 173). In the maritime suburb, separated from the city by a wall (1st cent. B.C.), are two slaughterhouses and baths of the Flavian era. On the northwest fringe of the city is the large suburban Villa of the Papyri (1st cent. B.C.), as yet explored only through underground passages; it probably belonged to L. Calpurnius Piso, Caesar's father-in-law. Several pieces of sculpture, as well as papyri from the private library of his philosopher friend Philodemus of Gadara, have been recovered.

BIBLIOG. A. Maiuri, Ercolano, Rome, 1959; EAA, s.v.

Ischia (Πιθηκοῦσσαι; Lat., Pithecusa, Aenaria). A large volcanic island between the Gulf of Gaeta and the Bay of Naples, inhabited since the Bronze Age. Pithekousai was perhaps the earliest West Greek colony, established about the first half of the 8th century B.C. by Chalcidian and Eretrian colonists; it was situated on the slope of Mt. Vico, in the northwestern part of the island, where a necropolis with Geometric and Orientalizing pottery has been found. In the 5th century it belonged to Neapolis, and in 82 B.C. was destroyed by Sulla. The eruption of Mt. Epomeo in the early 14th century obliged the islanders to take refuge on the rocky islet of the Castello d'Ischia. Here, enclosed by fortifications, are the Angevin castle (quadrilateral in plan) and the 14th-century Cathedral, with a Gothic crypt decorated with 14th-century frescoes. The Immacolata, an 18th-century church, has an adjoining Clarist convent. There are remains of the Church of S. Pietro (16th cent.). The causeway connecting the islet with the town of Ischia Ponte was built by the Aragonese in 1438. The modern quarter surrounds the ancient harbor. At Porto d'Ischia are S. Maria di Portosalvo (neoclassic) and S. Pietro a Pontaniello, as well as the Museo dell'Isola d'Ischia.

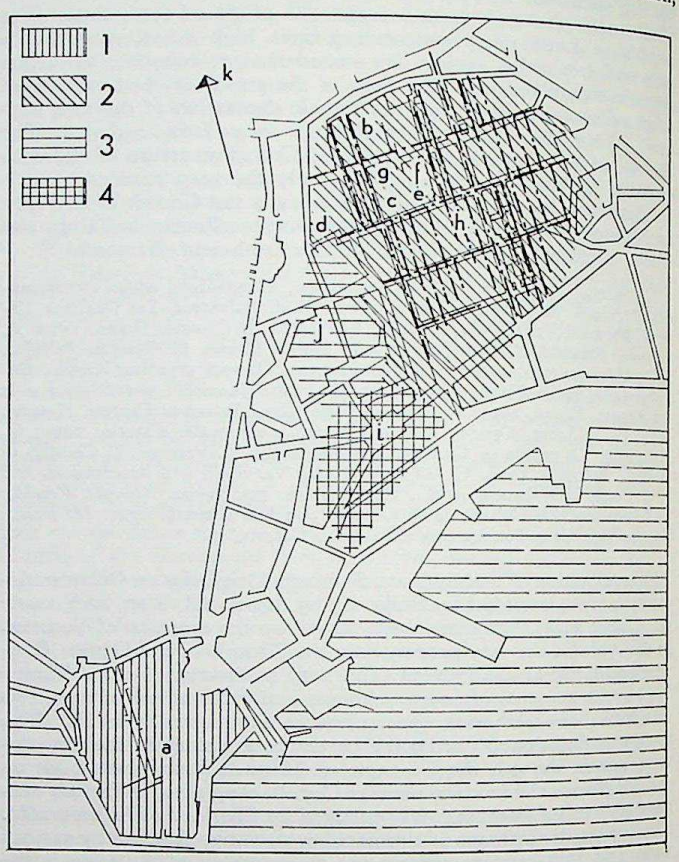
Naples (Νεάπολις; Lat., Neapolis; It., Napoli). The city is mainly modern in appearance, with picturesque quarters of steep, narrow streets divided by avenues and long rectilinear thoroughfares. Much of the central and harbor areas was rebuilt after damage by bombing in World War II.

Settled by Greek colonists (Cumaean or Rhodian) about the mid-6th century, Parthenope (later called Palaiopolis) was situated on the Pizzofalcone hill (necropolis of 7th–6th cent.; section of 6th-cent. walls). At the end of the 6th century B.C., after the destruction of Parthenope, the colonists founded Neapolis about a mile to the northeast. This part of the city retains the (5th-century Greek) regular urban grid plan (FIG. 700; VII, PL. 235), with elongated blocks formed by three broad avenues (*plateiai*) and as many as twenty-one narrow streets (*stenopoi*). Vestiges of the 5th-century walls (reinforced 4th cent. B.C.) are worthy of note. The remains of the supposed Temple of the Dioscuri (zone of the agora), of a theater, and of the odeum, as well as a large building (probably the aerarium) near S. Lorenzo Maggiore, are all of the 1st century of our era. The necropolis was used from the 5th century until the Roman period. In the 1st century B.C. the Palaiopolis area was occupied by a villa of Lucullus. On Cape Posillipo, at the western end of the bay, are the remains of Villa Pausilypon (of Vedius Pollionus) and part of the Serino aqueduct, built by Augustus (rebuilt 2d cent.; popularly known as "Ponti Rossi").

The earliest Christian monument is the Catacomb of S. Gennaro (2d cent.), with frescoes of various periods. The Catacomb of S. Gaudioso (5th cent.) contains frescoes of the 5th and 6th centuries. (See FIG. 703 for location of monuments.) The oldest church is S. Restituta (4th cent.), rebuilt during the Angevin period, when it was incorporated into the Cathedral, and redecorated in the 18th century (ceiling by Luca Giordano). It originally comprised a nave and four side aisles, divided by reused ancient columns and capitals, with a circular apse bounded by five square chapels. Other churches of the period had arcaded apses: S. Giorgio Maggiore (late 4th–early 5th cent.; remodeled 17th cent. by Cosimo Fanzago) has retained its original apse of this design. S. Gennaro extra Moenia (or dei Poveri; 5th cent.), comprising a nave and two aisles and a horseshoe-shaped apse, has remains of 5th- and 6th-century frescoes. S. Giovanni Maggiore (rebuilt 17th cent.) has retained part of the original 6th-century basilican structure. An important Early Christian building is the Baptistery of S. Giovanni in Fonte (5th cent.), on a square plan, surmounted by an octagonal dome on squinches of Eastern inspiration. Most of the mosaics are of Byzantine derivation,



Naples, plan of the ancient city with layout of streets. *Key*: (1) Area of the Greek Parthenope (Palaiopolis), ca. 680–530 B.C.; (2) area of the Greco-Roman city (Neapolis), from the 5th century B.C.; (3) expansion of the urban area in the age of Valentinian III (A.D. 440); (4) expansion of the urban area in the age of Narses (A.D. 556). Greek period: (*a*) Acropolis of Palaiopolis (mod. Pizzofalcone hill); (*b*) acropolis of Neapolis; (*c*) agora; (*d*) course of walls, 4th cent. B.C. Roman period: (*e*) Presumed Temple of the Dioscuri; (*f*) theater; (*g*) odeum; (*h*) probable aerarium; (*i*) baths; (*j*) edifice, perhaps thermal; (*k*) to the catacombs of S. Gennaro and S. Gaudioso.

but some are in a traditional Hellenistic-Campanian style. The only examples of Romanesque architecture are the campanile of S. Maria Maggiore (11th cent.), the Castel dell'Ovo, and the Castello Capuano (both 12th cent., later altered).

When Naples became capital of the Angevin kingdom in 1266, French architects, summoned by the court, brought with them a Provençal type of Gothic. S. Lorenzo Maggiore (begun 1267; remodeled in the 18th century and thereafter restored) has a high apse, with an ambulatory and radiating chapels. It contains the tomb of Catherine of Austria (1323), by Tino di Camaino. S. Maria del Carmine (1283–1300) is similar in type (remodeled 18th cent.). S. Domenico Maggiore (1298–1324; rebuilt several times) has a Latin-cross interior, with a nave and two aisles and lateral chapels. Gothic architectural elements are still to be seen in the Spinelli Chapel. In the church are the tombs of John and Philip of Anjou, by Tino, works by Giordano, a *Flagellation* by Caravaggio (1607), an *Annunciation* by Titian, frescoes of the school of Giotto, and many other works. The Cathedral (1294–1323; rebuilt and remodeled several times) has a Neo-Gothic façade (19th–20th cent.) incorporating the three Gothic portals of Antonio Baboccio da Piperno (1407). The interior is basilican in form, with nave and two aisles flanked by lateral chapels. The baroque chapel of S. Gennaro (begun 1608) is decorated with works by Fanzago, Giuliano Finelli (II, PL. 168), Giovanni Lanfranco, Domenichino, and Jusepe de Ribera. The Minutolo Chapel contains frescoes (14th–15th cent.) and a polyptych

UP State Museum, Lucknow

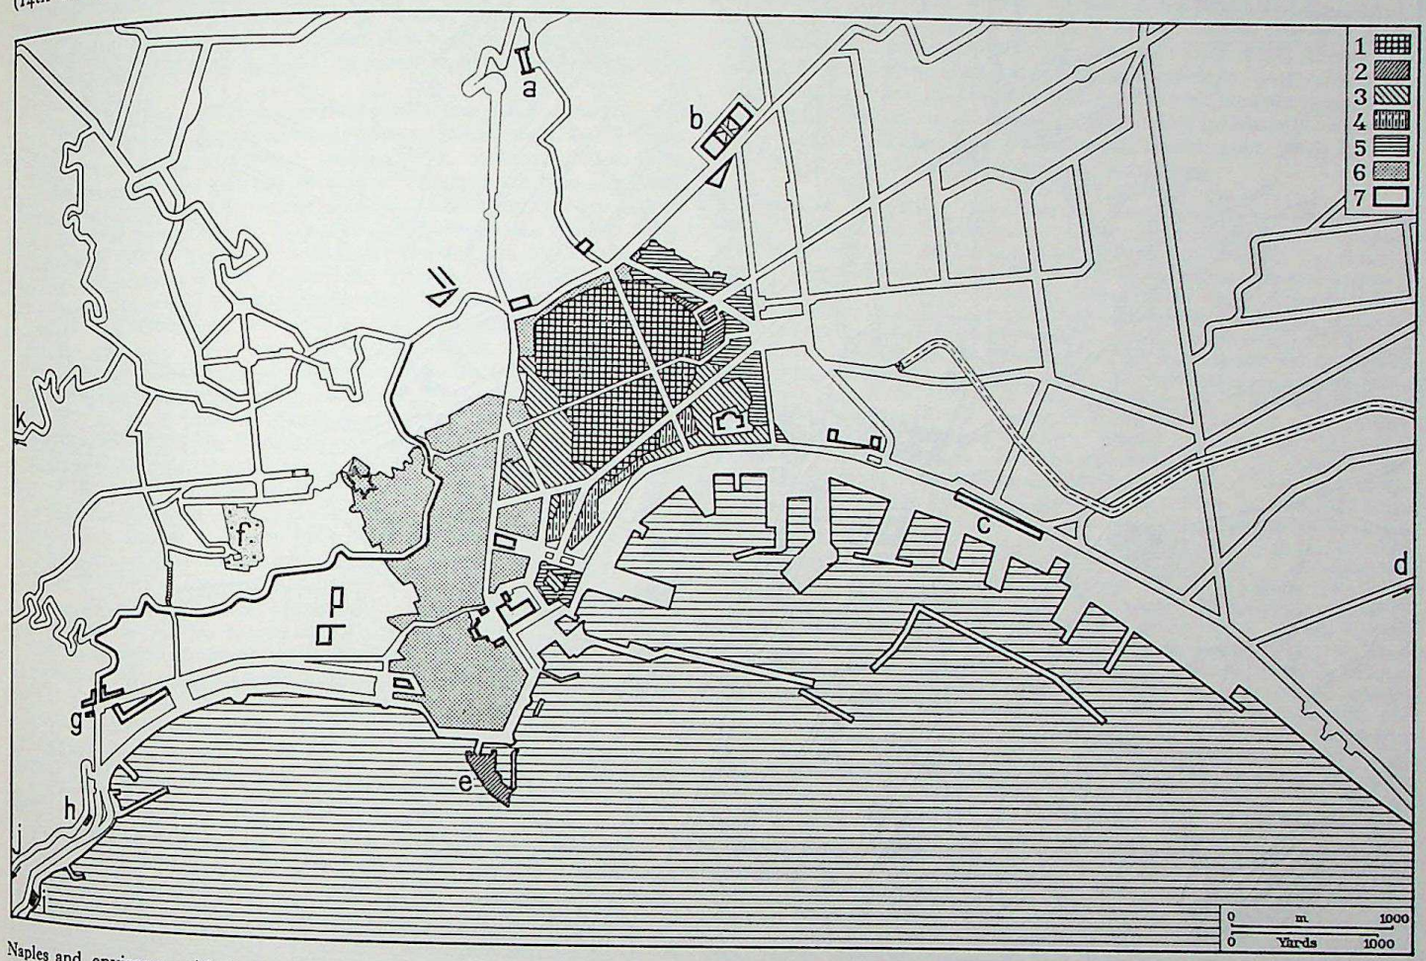
by Paolo di Giovanni Fei. S. Eligio (13th cent.) has a French Gothic portal (restored). S. Chiara (1310–28) had a baroque interior; damaged in World War II, however, it has been restored according to the 14th-century scheme. The façade has a rose window; the porch is Gothic. The interior comprises a nave flanked by chapels with funerary monuments and reliefs (14th cent.) by Tino and by Giovanni and Pace da Firenze. The adjoining Minorite cloister has a range of pointed arches over rounded ones. The Clarist cloister (14th cent.) was later (18th cent.) elaborately decorated with genre



Naples and environs, with indications of expansion from the Greek period to modern times. *Key*: (1) Greco-Roman period, until 5th century of our era; (2) Norman period; (3) Angevin period; (4) period of the Durazzo line; (5) Aragonese period; (6) Spanish period; (7) structures of the Bourbon period. scenes, landscapes, and ornamental elements in majolica. S. Maria Donnaregina (ca. 1320) contains the tomb of Queen Mary of Hungary by Tino (1326). The choir of the nuns is decorated with frescoes by Cavallini and pupils (III, PL. 108). The frescoes in the apartment of the abbess are by Solimena; those in the chapel are by Preti. S. Maria Incoronata (1352) has a Gothic apse and an arcaded porch with ogival arches; the frescoes are of the 14th and 15th centuries. S. Giovanni a Carbonara (1343; later rebuilt and thereafter restored) is a single-aisled church, approached by a flight of steps (18th cent.). Within is a monument to King Ladislaus (d. 1414), designed by Andrea da Firenze, with frescoes by Leonardo Molinari da Besozzo. The Cappella Caracciolo del Sole contains the tomb of Ser Gianni Caracciolo and frescoes by Perrinetto di Matteo and Besozzo (15th cent.); the floor is of glazed terra cotta (15th cent.).

Two buildings dominate the city: Castel S. Elmo (1329), on the summit of the Vomero hill, rebuilt on a star-shaped plan (16th cent.), and slightly below, the Certosa di S. Martino, built in the 14th century and remodeled in the baroque period. Gothic elements persisted through the 15th century, along with early Renaissance forms introduced by Tuscan artists. This "Durazzo" Gothic, introduced during the Angevin reign of the Durazzo line, is a form of Catalan Gothic brought to Naples by the court architect Guillermo Sagrera. The Castel Nuovo, built by Charles I (1279–82) and reconstructed in the 15th century, marks the transition from late Gothic to Renaissance. Trapezoidal in plan, with crenelated cylindrical towers at the corners, it is entered through the triumphal arch of Alfonso of Aragon (ca. 1454–67; III, PL. 390), the work of various Italian and non-Italian artists, among them probably Francesco Laurana. Inside the castle is the 14th-century Church of S. Barbara (Palatine Chapel), which has a Renaissance portal and contains a *Madonna* by the same Laurana as well as 14th-century frescoes. The Hall of the Barons, a square chamber designed by Sagrera (1443–53; remodeled and restored), is covered with an eight-part ribbed vault.

Also of the Renaissance is the Porta Capuana, built in 1484 by Giuliano da Maiano; it stands between two towers of the Aragonese walls. Numerous palaces were built by the nobility during this period. While some retain Catalan elements (ogival arches of the Durazzo type), others derive from 15th-century Tuscan models, with severe façades of rusticated ashlar and sometimes with inner porticoed courtyards. These include the Penne (1406), Cuomo (1464–90), Santangelo (late 15th cent.), Marigliano (1513), Carafa di S. Severino, Filomarino (rebuilt 1512), with a baroque portal, and Gravina (1513–49). Tuscan influence is evident in religious architecture, particularly in the monastic complex of S. Anna dei Lombardi, which includes the Church of Monte Oliveto (ca. 1410–15; remodeled after damage in World War II). Entered through a porch with a Catalan Gothic arch, the church comprises a nave with lateral chapels; the Mastrogiudice Chapel contains an *Annunciation* and other decorative reliefs by Benedetto da Maiano (1489). The Oratorio del Sto Sepolcro is decorated with frescoes by Francesco Ruviale (Il Polidorino) and contains the terra-cotta *Pietà* by Guido Mazzoni (1492), a striking group of eight freestanding figures, as well as the tomb of A. Fiodo by Francesco da Sangallo (Il Margotta). The Tolosa Chapel is by G. da Maiano. The Piccolomini Chapel, which may have been designed by the same artist, contains a *Nativity* and other reliefs (ca. 1475), along with the tomb of Mary of Aragon, all by Antonio Rossellino. Other noteworthy Renaissance ecclesiastical structures are the Pontano Chapel (1492) and S. Caterina a Formello (1519–93). The Gesù Nuovo (1584–1601; afterward enlarged and remodeled) incorporates the façade of the Palazzo Sanseverino (1470), executed in diamond-shaped ashlar of southern Italian type. The interior, an interesting example of Neapolitan baroque, comprises a tripartite nave and a transept faced with polychrome inlaid marble; there are

frescoes and other works by Solimena, Belisario Corenzio, Lanfranco, Stanzione, Giordano, Ribera, and Aniello Falcone.

The use of Renaissance classic forms persisted through the late 16th and early 17th centuries, with greater emphasis on the decorative element; this is seen in the Church of S. Gregorio Armeno, reconstructed by Giambattista Cavagna (late 16th cent.). The additions to the Certosa di S. Martino were built by Giovan Antonio Dosio, with the collaboration of Giovanni Giacomo Conforto (1580–1623), and were continued by Fanzago (until 1643). Within the monastery are works by Simon Vouet, Corenzio, Giuseppe Cesari ("Cavalier d'Arpino"), Caracciolo, and Stanzione (PL. 224). The floor and the marble decorations of the chapels in the church are by Fanzago (PL. 87). The church also contains frescoes and paintings by Lanfranco, Stanzione, Ribera, Andrea Vaccaro, Carlo Maratti

Naples, plan of the center. Principal monuments: (1) Cathedral and archiepiscopal palace; (2) S. Maria Donnaregina; (3) SS. Apostoli; (4) S. Giovanni a Carbonara; (5) S. Antonio Abate; (6) S. Maria degli Angioli alle Croci; (7) S. Maria dei Miracoli; (8) S. Maria della Sanità; (9) S. Teresa degli Scalzi; (10) S. Maria della Stella; (11) Museo Nazionale; (12) S. Maria delle Grazie and Hospital of the Incurables; (13) Church of the Gerolomini (S. Filippo Neri); (14) S. Paolo Maggiore and S. Lorenzo Maggiore; (15) S. Maria Maggiore; (16) Accademia di Belle Arti; (17) Palazzo Bagnara and Porta Alba; (18) S. Pietro a Maiella; (19) Palazzo Del Balzo, S. Domenico Maggiore, S. Maria della Pietà del Sangro, and S. Angelo a Nilo; (20) Palazzo Santangelo; (21) S. Gregorio Armeno and Palazzo Marigliano; (22) S. Giorgio Maggiore; (23) Castel Capuano, S. Caterina a Formello, and Porta Capuana; (24) S. Pietro ad Aram; (25) Church of the Annunziata; (26) S. Agostino della Zecca; (27) Palazzo Cuomo (Museo Civico Gaetano Filangieri); (28) SS. Severino e Sosio and Palazzo del Monte di Pietà; (29) Church of S. Chiara and the Gesù Nuovo; (30) D'Angri and Maddaloni palaces; (31) Church and Cloister of S. Anna dei Lombardi and Palazzo Gravina; (32) S. Maria la Nova; (33) S. Maria Incoronata and S. Giorgio dei Genovesi; (34) Castel S. Elmo and Museo Nazionale di S. Martino (Certosa); (35) S. Maria Apparente; (36) Palazzo Serra di Cassano and S. Maria Egiziaca a Pizzofalcone; (37) S. Maria degli Angeli; (38) S. Francesco di Paola; (39) Palazzo Reale and Teatro San Carlo; (40) Castel Nuovo; (41) S. Maria del Carmine; (42) Church and Hospital of Gesù e Maria.

705

(II, PL. 204), and Solimena. In the sacristy are works by Luca Cambiaso and Cesari; the Great Cloister (PL. 225) is by Fanzago and Dosio. The Church of S. Maria della Stella was designed by Carlo Fontana. The Church of S. Filippo Neri (I Gerolomini) was begun by Dosio in 1592 and completed in 1619; the façade was reconstructed by Ferdinando Fuga (18th cent.). There are frescoes by Giordano (1684) and paintings by Corenzio, Bernardo Cavallino, Guido Reni, and Solimena. The gallery adjacent to the church contains an important collection of paintings. The Palazzo del Monte di Pietà, built by Cavagna (1597–1605), has an adjoining chapel decorated by Pietro Bernini, Michelangelo Naccherino, and Corenzio. The Palazzo Reale, by Domenico Fontana (1600–02), is a large structure with three superimposed orders. It was altered in the 18th and 19th centuries.

The Neapolitan baroque, which characterizes a large part of the city, has a greater exuberance of decorative detail than the Roman baroque from which it derived, especially in those churches with high domes sometimes covered with glazed terra-cotta tiles (e.g., the churches designed by Giuseppe Nuvolo). The interiors are richly decorated with stuccowork, frescoes, and polychrome marble inlay and generally follow a plan derived from the designs of Giacomo da Vignola, with a nave and lateral chapels. The Church of SS. Apostoli, by Francesco Grimaldi (1626–33), contains frescoes and paintings by Lanfranco and Giordano, as well as the Filomarino altar of Borromini (X, PL. 192). S. Maria di Constantinopoli, designed by Nuvolo, has fresco decorations by Corenzio. The leading decorator and architect of the Neapolitan baroque was the Lombard Cosimo Fanzago. His works include S. Ferdinando (1628–60), S. Maria degli Angioli alle Croci (1638), S. Giorgio Maggiore (1640), S. Domenico Soriano, with a tripartite nave (begun 1648), and the façade of S. Maria della Sapienza. He also designed several churches on the Greek-cross plan: S. Giuseppe a Pontecorvo (1660); the Ascensione a Chiaia (1622–45); S. Teresa a Chiaia (1650–62), approached by a double circular staircase, and containing works by Fanzago and Giordano; S. Maria Egiziaca a Pizzofalcone, with a convex façade (1651); and S. Maria Maggiore (or La Pietrasanta; 1653–67), with works by Giuseppe Bonito. Of the same period is S. Maria della Sanità (1602), by Nuvolo, who incorporated into it the 5th-century Chapel of S. Gaudioso (below the presbytery); the church contains works by Giordano and Francesco (Pacecco) De Rosa. Many churches are elliptical in plan, for example, S. Maria Egiziaca, by Dionisio Lazzari (1684). Fewer are basilican, with tripartite nave and lateral chapels; these include S. Maria degli Angeli, by Grimaldi, and S. Paolo Maggiore, by Cavagna (ca. 1585–1603), with two Corinthian columns from the Temple of the Dioscuri incorporated into the façade.

The architecture of the late 17th and first half of the 18th century continued baroque forms and decoration. Campaniles and obelisks were added to the churches and the baroque piazzas of the city. The Guglia di S. Gennaro (a freestanding decorated pinnacle) was designed by Fanzago (1637–60); the obelisk of S. Domenico is by Francesco Antonio Picchiatti and Domenico Antonio Vaccaro (1658 and 1737, respectively), and the spire of the Immacolata (1747–51) is by Giuseppe Genuino and Giuseppe Di Fiore. S. Nicola alla Carità is by Onofrio Antonio Gisolfi and Fanzago, with the façade and frescoed ceiling (1701) by Solimena. One great exponent of 18th-century Neapolitan baroque was Domenico Antonio Vaccaro, who designed the Concezione a Montecalvario, a central-plan church, and decorated the interior as well. His works also include the Church of S. Michele (1730), the Palazzo Spinelli di Tarsia (unfinished), and the Cloister of S. Chiara, decorated with majolica. Ferdinando Sanfelice created a more theatrical style in both his secular and religious architecture. He remodeled Palazzo Pignatelli (1718), designed the portal of Palazzo Filomarino and the façade of S. Lorenzo Maggiore, and built the Church of the Nunziatella.

The Bourbon dynasty (1735–1860) brought about a period of expansion in Naples, with a particular increase in secular architecture. Among the buildings of this period are the Albergo dei Poveri (poorhouse), begun in 1751 by Fuga (completed much later), and the Palazzo di Capodimonte, begun in 1738 by Giovan Antonio Medrano (completed 19th cent.). The most important architect of the second half of the 18th century was Luigi Vanvitelli, who built the Palazzo Calabritto (1756) and rebuilt the Church of the Annunziata (1760), with a unitary nave flanked by Corinthian columns and surmounted by a dome. He also built the Foro Carolino (Piazza Dante), with a columned hemicycle in the Tuscan Doric order (1763). The Church of the Trinità (1796) exhibits a complex plan comprising two octagons joined by a rectangle; the Oratorio della Scala Santa (1772–73), on the other hand, has a more rigorously geometric plan.

The architecture of the early 19th century is neoclassic. The plan of S. Francesco di Paola (1817–46; I, PL. 305), by Pietro Bianchi, was derived from the Roman Pantheon. The Teatro San Carlo, built by Medrano in 1737 but later damaged by fire, was rebuilt in 1816 by Antonio Niccolini; the Villa Floridiana (1817–19) was designed by the same architect. In the late 19th century many public buildings were erected in the "Floreale" style. An example is the Galleria Umberto I, designed by Emanuele Rocco (1887–90) in imitation of the Galleria in Milan. About the same time many wide streets and avenues were laid out, including Corso Umberto I, or Rettifilo (1888–94). In the urban development of the 20th century, new quarters have been built on regular grid plans (e.g., the Vomero, Carità, and Mergellina quarters).

Museums and Galleries: Museo Nazionale (Farnese Coll., antiquities from Campania); Museo e Gallerie Nazionali di Capodimonte (paintings, sculpture, decorative arts); Museo Civico Gaetano Filangieri (Palazzo Cuomo; paintings, ceramics, minor arts); Museo Nazionale di S. Martino (Certosa; paintings, drawings, sculpture, minor arts); Museo Duca di Martina alla Floridiana (porcelain, ceramics, paintings); Galleria dell'Accademia di Belle Arti (paintings, sculpture); Museo Principe Diego Aragona Pignatelli Cortes (porcelain); Raccolta d'Arte Pagliara (paintings, drawings, ceramics).

Nocera Superiore. This town of ancient origin is situated on the north side of the pass between the valley of the Sarno and the Gulf of Salerno, on the Via Popilia. In the 5th century B.C. it prospered under the Samnites, but was conquered by the Romans in 307. The orthogonal plan is still recognizable; there are remains of sections of the walls (2d–1st cent.), an amphitheater, and the ruins of a cryptoporticus. S. Maria Maggiore was built as a baptistery (5th cent.?); although it was partly remodeled and later restored, the basic structure has not been altered. A circular building, with a dome supported by columns, it contains a basin for baptism by immersion. Outside the town a number of ancient tombs have been found, the oldest of which date from the 6th century. Near Nocera is the Sanctuary of Materdomini, built between 1168 and 1172 (remodeled 1771–96; restored 1947).

Nola. This city was first Ausonian and later Etruscan. It was conquered by the Samnites in the latter half of the 5th century, and in 313 B.C. it became an ally of Rome. Destroyed by Alaric in 410, it was rebuilt as a Christian city. Under the Angevins it was a county;

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

later it belonged to the Orsinis, and in 1528 it became a royal city. Nola is known for the numerous Greek vases, both imported and locally manufactured, that have been found there. Also of the ancient period are remains of the Samnite walls, of houses, and of a Roman amphitheater, as well as an important necropolis with painted chamber tombs. The Church of the Misericordia (or S. Biagio; 14th cent.) has a Romanesque façade and campanile and a Gothic apse. The palace built for the Orsini family (1461) was partially of material salvaged from the Roman amphitheater. The Palazzo Covoni (16th cent.) is in Renaissance style and also incorporates Roman fragments. The churches of the Annunciata and the Immacolata are baroque. The seminary of the episcopate (1749) is by Luigi Vanvitelli, as are the Duke of Aosta Barracks. The neoclassic Cathedral was designed by Nicola Breglia (1878–1909), to replace the 14th-century Cathedral destroyed by fire. The crypt, built over the ruins of a Temple of Jupiter, contains fragments of 8th- and 9th-century sculpture.

Paestum (Ποσειδωνία). Situated about a half mile from the present coast line of the Gulf of Salerno, the site was inhabited in the Neolithic age (necropolis near Contrada Gaudo, ca. 2400–1900). In the late 7th or early 6th century Achaean Greeks founded the colony of Poseidonia. An important center of commerce with the Etruscans, it was conquered by the Lucani in the early 4th century and by the Romans in 273 B.C.

The city has a roughly trapezoidal plan, which is divided by three east–west *plateiai* and numerous north–south *stenopoi*, creating long rectangular blocks (120 × 1,000 ft.). The sanctuaries and the forum are at the center (VII, pl. 53). Substantial sections of the walls are well preserved, the oldest probably dating from the 6th century B.C. They have both round and square towers, four principal gates, and numerous posterns. The two largest temples, the so-called "Basilica" and the Temple of Hera Argiva (called "Temple of Neptune"), are enclosed in a common temenos, south of the forum. The "Basilica" (I, pl. 333), the earliest temple preserved at Paestum (mid-6th cent. B.C.), has 9 Doric columns on each end and 18 on either side. From the portico, a pronaos *in antis* (the 2 piers, like the 3 columns, with entasis) leads to the cella, divided longitudinally by a row of 7 columns. The so-called "Temple of Neptune" (or Poseidon; ca. 450 B.C.) is the largest of the Paestum temples. Architecturally similar to the Temple of Zeus at Olympia, it is a peripteral hexastylos with 14 columns along the sides. Small shrines and treasuries of various periods, as well as altars, surrounded these temples. North of the forum are an underground shrine dedicated to an unidentified goddess (6th cent. B.C.) and the Athenaion, or "Temple of Ceres" (late 6th cent. B.C.), a peripteral hexastylos with 13 columns along the sides. The peristyle is Doric, but the columns of the pronaos are Ionic. The Athenaion was also surrounded by smaller buildings and votive shrines. North of the forum is an Italic temple, begun in 273 as the *capitolium*, then abandoned, and resumed about 80 B.C. Near the eastern flank are the remains of a circular cavea, probably used for public assemblies of the Roman colonia. Other structures around the forum include the presumed senate house (*curia*), an amphitheater, and tabernae. Later excavations have brought to light several houses built around an atrium (some from the republican period), a large gymnasium, and several baths. The necropolis contains painted tombs (IV, pl. 397; VII, pl. 72), and there are funerary *naskoi* on platforms that date from a later period. The Museo Archeologico holds finds from Paestum and the Sele Heraion.

About 5 miles north of Paestum, at the mouth of the Sele River, is a Heraion (late 6th cent. B.C.), from which the foundations of the peristasis have been preserved. There are also remains of a treasury and a megaron, somewhat earlier in date. Most of the figured metopes from the temple and the treasury have been recovered; some of these had been reused in structures of the 4th century B.C.

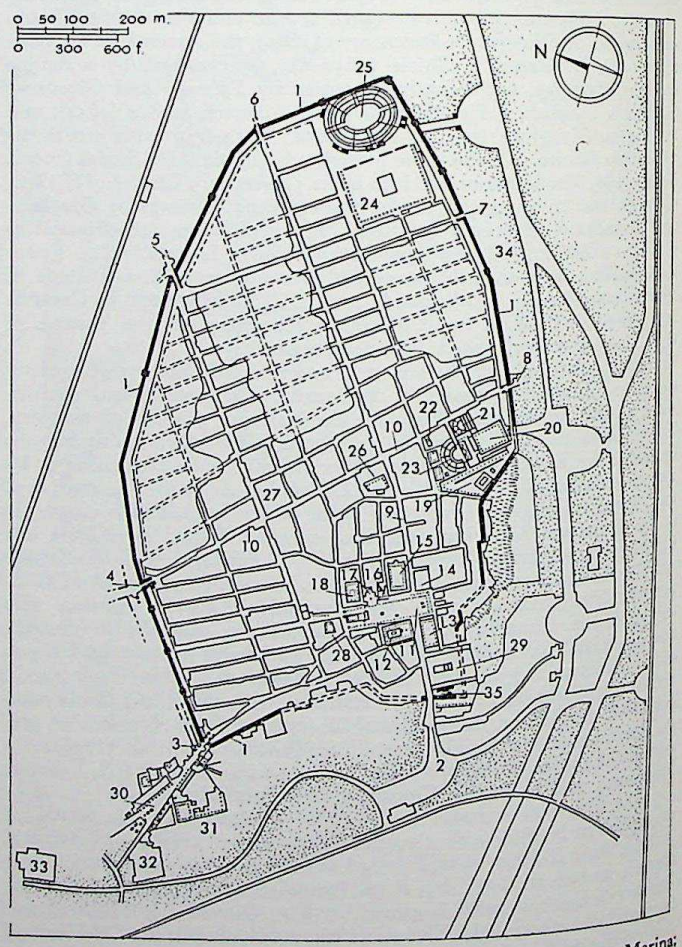
Pompeii. Situated north of the mouth of the Sarno, this city, though probably of indigenous origin, was early dominated by the Etruscans and Greeks. In the 5th century it was conquered by the Samnites, and in 80 B.C. it became a Roman colonia. Severe damage was caused by the earthquake in A.D. 62, and the eruption of Vesuvius in 79 buried the city beneath a thick layer of volcanic ash and pumice. The continuing excavations began as early as 1748.

The oldest nucleus, which appears to have been inhabited from about the 6th century B.C., includes the southwestern sector of the city and the area of the forum (fig. 708). To this period belong the Temple of Apollo, near the forum, and the oldest parts of a Doric peripteros dedicated to Hercules (later to Athena also), set within the so-called "Triangular Forum." The enlarged city of the 5th century B.C. follows the Hippodamian plan, with *plateiai* and *stenopoi* marking out elongated, mostly orthogonal blocks. Many blocks in the eastern sector were only partially occupied, suggesting that urban areas were laid out according to a regular plan, in preparation for future development. The first stage in the construction of the city walls dates from the pre-Samnite epoch, while three further stages are from Samnite times. In the last of these phases, a few years before the Samnite Wars (late 4th–early 3d cent.), the towers were built, with ramps to accommodate military equipment. The gates, of the Samnite and Roman periods, are deeply set back between



Pompeii, schematic plan of the ancient city. (1) Walls; (2) Porta Marina; (3) Porta Ercolano; (4) Porta Vesuvio; (5) Porta di Nola; (6) Porta di Sarno; (7) Porta Nuceria; (8) Porta di Stabia; (9) *decumanus maximus* (Via dell'Abbondanza); (10) *cardo maximus* (Via di Stabia); (11) forum, north of which is the Temple of Jupiter; to the south, the *curia*, between the office of the aediles and that of the duumvirs; (12) Temple of Apollo; (13) so-called "Basilica"; (14) comitium; (15) building of Eumachia; (16) Temple of Vespasian; (17) lararium; (18) *macellum*; (19) Triangular Forum, with Doric temple; (20) large theater and the Ludo Gladiatorio; (21) odeum; (22) Temple of Jupiter Meilichius (Zeus Meilichios); (23) Temple of Isis; (24) palaestra; (25) amphitheater; (26) Stabian Baths; (27) central baths; (28) Baths of the Forum; (29) Temple of Venus; (30) Via dei Sepolcri; (31) Villa of Cicero; (32) Villa of Diomedes; (33) Villa of the Mysteries; (34) necropolis; (35) antiquarium (*from A. Maiuri, Pompei, Rome, 1959*).

lateral bastions. The forum is of the Samnite period and comprises shops, a large three-aisled basilica, the Temple of Apollo (with a quadriporticus), the platform of the Temple of Jupiter, and the oldest market (*macellum*). Of the same period is the Triangular Forum, which may have served as the citadel; it includes a long Doric portico and a sacred well with a monopteral covering, along with the aforementioned older Doric temple. Adjacent are the palaestra and a large open theater. The original structure of the Stabian baths is also Samnite, with reconstruction during the time of the Roman colonia and later. The upper part of the *capitolium*, the Temple of Venus Pompeiana, the odeum, the amphitheater, and the Baths of the Forum (PL. 96) all date from the early years of the colonia. Somewhat later in date are the *curia*, the Temple of Isis, the great palaestra, the Temple of Fortuna Augusta, the aqueduct and the so-called "Castellum Aquae" for channeling the water, the mercantile building of Eumachia (given by this priestess to the *fullones*, a clothmakers' guild), and several commemorative arches in the zone of the forum. The Temple of Vespasian, a large part of the portico of the forum, the vast and luxurious central baths, and a number of partly finished reconstructions (e.g., the *macellum*) were undertaken after the earthquake of A.D. 62.

Pompeii preserves Italic domestic architecture and wall decoration in the period from the 4th century B.C. through the first century of the Empire. The House of Sallust, with well-preserved stucco decorations in Style I, is a fine example of a Samnite house. The austere House of the Surgeon is a characteristic structure of the so-called "limestone period" (4th–3d cent.) and derives from the oldest known type of Italic house. The larger houses, with at least one peristyle and often with two atria, date from the 2d century B.C.; among these are the House of the Faun (VII, PLS. 154, 200), the House of the Labyrinth, and the House of Pansa. Also from the 2d century are some isolated examples of houses with a Corinthian atrium, such as the House of Edipius Rufus, which had a paved platform before the entrance. The standard type of patrician mansion is seen fully developed in the House of the Silver Wedding (of Samnite origin, with further construction under Augustus and later) and in the House of Menander (1st cent. B.C.). The houses of the Neronian era, which foreshadow the Ostia type, are represented by the House of the Golden Cupids, with a raised stagelike area at one end of its peristyle. Elaborate garden architecture is a feature of many of the larger residences (PL. 425). Some of the suburban villas have portions dating back to the Samnite period; these include the Villa of Diomedes and the Villa of the Mysteries. The latter residence is of particular interest not only for the organic quality of its architecture but also for the excellent decorations in Style II, with wall paintings of Dionysian subjects (IV, PL. 168; VII, PL. 203; IX, PL. 246). The Roman funerary monuments in the city are remarkable for the variety of types (with exedra, aedicula, altar, etc.).

Near Pompeii are many Roman country houses, notably at Boscoreale and Scafati. There is an Antiquarium at the excavation site of Pompeii.

Pozzuoli (Δικαιάρχεια; Lat., Puteoli). Situated west of Naples, on the Bay of Pozzuoli, the town was founded by Greek exiles from Samos (ca. 529–520 B.C.), and for a time was probably a dependency of Cumae. During the war against Hannibal it was a Roman stronghold, and in 194 B.C. a maritime colonia was established. It became the chief port for Rome and remained an important commercial center until the last years of the Empire. A Christian community existed even before the arrival of St. Paul in A.D. 61. After the barbarian invasions the site was abandoned. Views of Roman Puteoli are found in paintings of the 1st and 2d centuries (IX, PL. 5) and on some glass bottles of the 4th century. The acropolis stood on an isolated hill near the sea, where remains of Greek-Samnite walls and of the Temple of Augustus can still be seen. The ancient city lay north and west of this point, but the coastal portion has gradually become submerged. On the higher terrain there remain two amphitheaters, of the republican and Flavian periods, two reservoirs (one, the vast Piscina Cardito), a porticoed square, two large bath complexes (2d cent.), and vestiges of warehouses, the stadium, and several villas. In the lower city are the ruins of the emporium and of the large market (the so-called "Temple of Serapis"), partially submerged. The harbor basin was protected by the "Opus Pilarum," a quay composed of arches resting on buttresses. Along the roads to Capua and Naples there are columbaria of the 1st and 2d centuries. The Cathedral (S. Procolo), built in the 11th century on the site of a Temple of Augustus, incorporated salvaged Corinthian columns (reconstructed 17th cent.).

Ravello. The town prospered in the 11th and 12th centuries, when Ravello maintained close commercial relations with Sicily and absorbed from it the Arabo-Norman style of architecture evident in many buildings. The Palazzo Rufolo (begun 11th cent.; PL. 175) has interlacing arches that fulfill a structural as well as a decorative function. S. Maria Immacolata (or a Gradillo), a small three-aisled church, dates from the 12th century. S. Giovanni del Toro (founded 975, consecrated 1276) has a 12th-century pulpit (restored), richly decorated with mosaics and majolica. The Annunziata, S. Agostino, and S. Martino are all similar in design: surmounted by a dome with two-color decoration, they have basilican interiors with aisles divided by stilted arches and covered by groined vaults. Siculo-Arabic influence is seen in the campaniles of these churches. The contemporaneous Cathedral (S. Pantaleone; 1086) was executed in a pure Romanesque style (remodeled 1786). Originally it was preceded by a portico; the façade (restored 1932) has bronze doors designed by Barisanus of Trani (1179). The interior furnishings have been reconstructed partly from the original materials. These include an ambo (1130) and a carved pulpit, by Niccolò di Bartolommeo da Foggia (1272); both have mosaic ornamentation similar to that of the episcopal throne (reassembled in part from material take from the pulpit). Two antique columns comprise the paschal candlestick. The campanile, with two orders of double-arched windows, dates from the 13th century. The Casa di Tolla, the present-day Municipio, was built in the 11th century. The Gothic church of S. Francesco retains part of the original transept and a small Romanesque cloister.

Salerno (Lat., Salernum). A site inhabited in the Iron Age (Villanovan culture in a necropolis at Pontecagnano), it was probably colonized by the Etruscans, perhaps as the town of Marcina (necropolis at Fratte di Salerno, 6th–3d cent.). Salernum became a Roman colonia in 194 B.C. In 646 it was conquered by the Lombards, and in 1077 by the Normans under Robert Guiscard. From the early Middle Ages until 1812 it was the seat of a renowned school of medicine.

The city consists of a medieval quarter, with narrow, irregular streets coursing the side of a steep hill crowned by a castle, and a modern sector paralleling the water front, with a rectilinear disposition of broad streets. From the Lombard period are the additions to the Castle of Arechi, founded by the Romans, later enlarged and remodeled under the Normans; the remains of the Porta Rateprandi; the Arch of Arechi, the only extant portion of the 8th-century palace of the Lombard prince Arechi; the Church of S. Pietro a Corte, built as the chapel of the palace; and the Church of the Crocifisso, remodeled in the 18th century but once more restored to its original form within (13th-century fresco in the crypt). The earliest building remaining from the Norman period is the Cathedral, built in 1079–84 and remodeled in the 18th century by Arcangelo Guglielmelli. Restoration has revealed some of the original Romanesque structure. The present façade (built in 1722) retains the bronze doors cast in Constantinople (1099), which are framed with Romanesque jambs and a Roman marble architrave. Remodeled in the 18th century, the interior preserves some mosaics in a Byzantine manner (11th–13th cent.); in the nave there are two restored 12th-century ambos (PL. 82), with mosaic decoration showing Sicilian influence. The iconostasis (reassembled) and the paschal candlestick are also decorated with mosaics (11th cent.). The balustrade enclosing the altar is of the 12th century and has mosaic decoration. In the central apse are remains of the marble throne of Pope Gregory VII (Hildebrand), who is buried under the left apse. The floors of the presbytery and transept are of marble mosaic, similar to those executed for Abbot Desiderius at Montecassino. There are many funerary monuments, among them that of Margaret of Durazzo, wife of Charles III, by Antonio Baboccio da Piperno (15th cent.). The crypt was remodeled in the 17th century by Domenico Fontana and decorated by Pietro Bernini and Belisario Corenzio (restored 1954). The walls are faced with polychrome marble. Also of the 12th century are the small campanile of S. Andrea and the episcopal palace, with Romanesque portico and a two-aisled Gothic hall (salvaged columns from the Roman temple of Pomona). There exist some 13th-century parts of the Norman aqueduct and remains of the Palazzo Fruscione.

Of the baroque period are the churches of S. Giorgio (1674), Monte dei Morti, and S. Salvatore; the Addolorata; the Annunciata, with a campanile by Luigi Vanvitelli; the Palazzo Bottigliari; and the Palazzo d'Avossa. *Museums*: Museo Provinciale; Museo del Duomo.

Santa Maria Capua Vetere (Lat., Capua). Site of old Capua. Originally inhabited by the Oscans, an indigenous Italic people, it may perhaps be identified with Volturnum (Vulturnum). Later the chief Etruscan city of Campania, in the second half of the 5th century B.C. it was conquered by the Samnites. Thereafter it became one of the major Roman cities in southern Italy. After its destruction by the Saracens about 840, the population took refuge in Casilinum (mod. Capua). The Roman centuriation of the *ager campanus* (early 2d cent. B.C.) can be seen in the modern road network and property divisions; the Hippodamian grid of the Roman city is visible in parts of the modern city.

From a sanctuary in the Fondo Patturelli have come figures of mothers with children in swaddling clothes, carved from volcanic tuff (6th–1st cent.; V, pl. 352), as well as architectural fragments and terra cottas. Some of these are among the best examples of Italic art (pl. 229; V, pl. 38). There are also a number of tombs, the earliest dating from the 7th century B.C.; some have funerary chambers with painted decoration (4th cent. B.C.). Of the Roman period are a 1st-century theater and an amphitheater built in the reign of Hadrian (2d cent.). An underground Mithraeum with wall paintings dates from the early 2d century. The brick triumphal arch spanning the Via Appia was probably built in honor of Hadrian; it was originally tripartite, but only the south arch and three piers have survived. There is a cryptoporticus, once probably part of a large bath. Along the Via Appia are two noteworthy Roman tombs of the 1st and 2d centuries. The present-day church of S. Maria delle Grazie incorporates the minor apse of the basilican Church of SS. Stefano e Agata (4th cent.), which contains a 13th-century fresco. The Cathedral was founded in 432 (enlarged 787 and 1666; remodeled 18th cent. and 1884); most of the interior columns were taken from Roman monuments. The Antiquarium has archaeological material.

Sessa Aurunca (Lat., Suessa). Founded by the Aurunci, in 313 B.C. Suessa became a colonia with the Latin right. During the time of the Social War it became a municipium (90 B.C.), but under Augustus it was again a colonia. In the Middle Ages it belonged to the Church; in the 13th century Clement IV ceded it to Charles I of Anjou, as part of the Kingdom of Naples. There are remains of the Hellenistic walls (restored 1st cent. B.C.), of a theater, of an amphitheater, and of a cryptoporticus; outside the town are remnants of a brick bridge from the Roman era. Of the early Middle Ages are the city walls, incorporating the Porta Cappuccini (flanked by small cylindrical towers), as well as a small Early Christian church. The castle, partly in ruins, has a high rectangular tower.

The Cathedral was begun in 1103; salvaged Roman materials were used in the construction. It is preceded by a 13th-century porch, which has three arches decorated with reliefs. The three portals of the façade are also decorated with sculpture, some of which is Roman. The interior is basilican, with nave and two aisles. Remodeled in the baroque period, it retains some of the original furnishings, including the altar, the paschal candlestick (pl. 175), the pulpit (X, pl. 439), and the parapet of the organ loft, all with marble mosaic ornamentation and sculpture by Taddeo and Pellegrino (13th cent.). Also from the original structure are the columns and the mosaic pavement with geometric designs. Except for the stairs, the crypt is in the original state. Many houses have 15th-century portals of the Durazzo type. The Palazzo Ducale was built in Renaissance style (much restored) over the ruins of a Roman structure, perhaps a Temple of Hercules. Many of the campaniles and domes in the town are faced with yellow and green majolica.

Cochetti Pratesi, Rilievi nella Cattedrale di Sessa Aurunca e lo sviluppo dei marmorari "neocampani" nel XIII secolo, Comm, IX, 1958, pp. 75–87.

Sorrento (Lat., Surrentum). Possibly a town of Greek origin, it was later under Samnite and then Roman rule, and in the late republican period it became a municipium. Distributed over its regular grid plan are a few remains of the Samnite walls and of Roman edifices; on the outskirts of the town, there are tombs dating from the 6th century B.C. to the Roman period. An ancient sanctuary dedicated to the sirens is known to have existed, as well as a Roman sanctuary of Athena (Minerva), at Punta Campanella. There are also vestiges of Roman seaside villas.

A number of 11th-century works show Byzantine influence: the campanile of the Cathedral, with Corinthian and Byzantine capitals; the windows in the Palazzo Veniero; and the side portal of the Church of S. Antonino, which has moldings with geometric patterns in white stone alternated with black lava. The Gothic style is represented only by the cloister of S. Francesco d'Assisi (14th cent.), with interlaced arches of Arabic type, the Palazzo Correale (early 15th cent.), the Casa Ferola, and houses on the Vico Grazie. The Sedile Dominova (15th cent.), a square loggia with rounded arches, is surmounted by a 17th-century dome faced with glazed terra-cotta tiles. The Cathedral was remodeled in the 15th century, and the Neo-Romanesque façade was added in 1924. A few sections of the 16th-century walls survive. The Museo Correale di Terranova has archaeological exhibits and paintings.

Apulia (It., Puglia, or Puglie). This region was the most advanced area of the Italian mainland in prehistoric times. Particular evidence of the region's development is provided by its production of painted and incised ceramics and prehistoric monumental remains, including dolmens, menhirs, and the rock tumuli known locally as *specchia*. The region was subsequently subject to the influence of Cretan-Mycenaean culture. In historical times the Greeks founded the colony of Taras (mod. Taranto), which was to become one of the most important cities of Magna Graecia. Nevertheless the population of Apulia chiefly comprised the indigenous Iapygians, or Apulians, subdivided into Daunians in the north, Peucetians in the central area, and Messapians in the south. These Greek-influenced Apulians lived in large fortified cities, and Geometric pottery was a characteristic artistic production. By the 4th century B.C. there were important centers of the production of Greek-style ceramics (e.g., the Apulian and Gnathia vases). Under the Romans, Brundisium (mod. Brindisi), at the eastern terminus of the Via Appia, became the chief Italian port to the eastern Mediterranean. The period of Byzantine domination (to which belong the rock-hewn grottoes, known as lauras, of the Basilian monks) was marked by continual strife between the Lombards and Byzantines. With the Normans, the Crusades, and the Hohenstaufen monarchy, Apulia again attained a certain historical and cultural eminence, attested by the castles and large Romanesque cathedrals that were built. The most significant artistic manifestation after the Middle Ages was the baroque art created in Lecce, an art characterized by a great abundance of decorative elements, influenced in part by Spain. Noteworthy too is the folk architecture represented by the trulli of Alberobello and other Apulian towns.

Alberobello. This town is noted for the curious form of its houses, known as trulli (from the Greek word τρούλλος, "cupola"). The cylindrical base of the trullo is whitewashed on the outside. The base is topped by a steep conical roof formed of concentric rings of grey stones. The original design is a one-story structure. Only the so-called "Trullo Sovrano," in Piazza Sacramento, has two stories and is almost 50 feet tall. The trulli probably derive from the circular dwellings of protohistoric Mediterranean cultures. This folk architecture has influenced local modern architecture (e.g., the Church of S. Antonio). Trulli are very common residences in the area (V, PLS. 337, 354).

Altamura. Remains of megalithic walls have been found in Altamura, but the present city was founded by Frederick II in the first half of the 13th century. The Cathedral, one of the palatine basilicas of Apulia, was begun in Romanesque style in 1232, rebuilt after the earthquake of 1316, and remodeled in 1534. The façade is flanked by two 16th-century towers with baroque spires (added in 1729) and has a richly ornamented Romanesque portal and a 14th-century rose window. The Gothic Church of S. Nicolò dei Greci preserves interesting low reliefs of Biblical subjects on the portal.

Masi, Altamura farnesina, Bari, 1959.

Andria. The site has been inhabited since prehistoric times, as attested by tombs. The city was founded by the Normans and fortified with walls. Particularly important under Hohenstaufen rule, it finally became the duchy of the Carafas (16th–18th cent.). The Cathedral, originally Romanesque but completely remodeled, preserves the original campanile (1118; upper part, 13th–14th cent.) and the 9th–10th-century crypt. The churches of S. Agostino and S. Francesco are baroque. The sacristy of S. Domenico contains a bust (1472) of Francesco II del Balzo, duke of Andria, attributed to Francesco Laurana. In the cloister adjacent to the Church of S. Maria Vetere are three small paintings (of SS. Clare, Augustine, and Bernardino) by Antonio Vivarini. The 15th-century Church of S. Maria di Porta Santa has a Renaissance portal. The Palazzo Ducale was remodeled in the late 16th century and again in the 19th century. The Porta S. Andrea was rebuilt in baroque form in 1593. Outside the town are Sta Croce, a 9th-century Basilian laura with late Byzantine frescoes, and S. Maria dei Miracoli, a 16th-century basilica built over a Basilian crypt.

Near Andria is Castel del Monte, begun before 1240 by Emperor Frederick II as a hunting castle. It is octagonal and has octagonal towers at the corners. The castle has eight trapezoidal rooms (one to each side of the octagon) on each floor, with vaulted ceilings and Gothic capitals.

Bari (Lat., Barium). The chief city of Apulia, Bari has an old quarter known as Bari Vecchia, with picturesque and irregular narrow streets. The newer part began to develop in the early 19th century. Bari may have been a Peucetian city in its own right or, at the least, the port of the neighboring city of Caeliae (mod. Ceglie del Campo). Under the Roman Empire, Bari was a municipium. In the Middle Ages the city was important chiefly for its relations with the eastern Mediterranean. It was alternately dominated by the Byzantine Empire, the Lombards, and the Normans. It was one of the embarkation ports for the Crusades, and the city prospered under the Hohenstaufen dynasty.

The Church of S. Nicola, one of the palatine basilicas of Apulia, was begun in the late 11th century and consecrated in 1197 (XII, PL. 223). It is the prototype of Apulian Romanesque church architecture. It was built within the precincts of the castle of the Byzantine catapan. The façade, flanked by unfinished squat towers, is simple but well proportioned. The façade of the transept has two orders of double-arched windows and a round window. The portals and windows are decorated with sculptures of classical and Byzantine derivation. The interior, with three aisles, is reinforced by transversal arches added in the 15th century. The presbytery (built over a crypt) runs directly into the transept, which is as tall as the nave. The altar has a 12th-century ciborium. In the central apse, which has a 12th-century mosaic floor, is the monument to Bona Sforza (16th cent.). Below this monument is the marble episcopal throne (12th cent.). In the right apse is a panel of the Madonna with four saints by Bartolomeo Vivarini (1476). The ceiling of the central aisle and presbytery is of the 17th century. The Cathedral was built in 1170–78 on the ruins of the Byzantine cathedral that had been destroyed by William of Sicily. Although similar in plan to S. Nicola, the Cathedral was remodeled a number of times and restored to its original design in 1954–55. All that remains of earlier remodeling are the three baroque façade portals. The interior preserves the columns and the screens from the Byzantine building. The episcopal throne and the pulpit were reassembled from the original fragments in 1934 (restored in 1954). The Cathedral also preserves some noteworthy sculpture. The elegant baroque decoration of the crypt has been retained. Off the left aisle of the Cathedral is the so-called "Trulla," a cylindrical structure (1618–1740) that serves as the sacristy. The Romanesque Church of S. Gregorio (completed in 1089) preserves its original façade. The interior has three aisles and three apses without transept. Tall impost blocks rest on columns of different forms and provenances. The main nucleus of the castle was built

by Frederick II (1233–40) on earlier Norman fortifications. The jutting bulwarks with towers were added in the 16th century. The Renaissance Church of S. Agostino (also known as S. Anna) incorporates in the façade fragments of the earlier Romanesque Church of S. Pelagia. The Renaissance Palazzo Tanzi was built in the 15th century. Baroque churches include S. Teresa dei Maschi, S. Michele (the crypt of which was the Romanesque Church of S. Felice), and S. Chiara. The modern part of the city is laid out on a rectangular plan of regular square blocks with neoclassic and modern edifices. *Museums*: Museo Archeologico (in the Ateneo); Pinacoteca Provinciale (in the Palazzo della Provincia); Gipsoteca (in the castle).

Bari, I, 1958, p. 980.

Barletta (Lat., Barduli). The site was inhabited in the 3d century B.C. It became important under the Normans, who built the walls and the rectangular castle. The castle was rebuilt by the Hohenstaufens and enlarged under the Angevins, in 1282–91. The four lance-shaped bulwarks on the corners were added in 1532–97. The oldest part of the Cathedral, one of the palatine basilicas of Apulia, was begun about 1140 and consecrated in 1267. The three-aisled Apulian Romanesque Cathedral originally had three apses, but in the 14th century it was lengthened and a polygonal apse with five radiating chapels was built. The original façade has been preserved, but with the addition of the 16th-century central portal and Gothic spires. Within the Cathedral are a 13th-century pulpit and episcopal throne and a Romanesque ciborium. Sto Sepolcro, originally built in Romanesque style, was remodeled in Burgundian-Gothic style in the late 13th century. The baroque façade preserves the Gothic right portal. The base of the campanile is incorporated in the left side of the façade. The dome was reconstructed in the 18th century. The interior has a nave and two aisles divided by cruciform piers. The church has a fine treasury. Next to Sto Sepolcro is the so-called "Colosso," a 4th-century bronze statue (probably of Emperor Valentinian I). Probably brought from Constantinople in the 13th century, the statue is almost 15 feet tall. S. Giacomo and S. Agostino (both, 13th–14th cent.) retain little of the original structures. The 14th-century Palazzo Bonelli is the best-preserved Gothic palace in the city. S. Andrea, built in the 12th century but enlarged and remodeled in 1528, retains only a few fragments of the original Romanesque structure. Baroque structures include the palace of the Monte di Pietà and adjoining church (formerly Church of the Gesuiti); Palazzo della Marra; the Banco di Napoli (formerly Palazzo Gentile di Lesina); the Church of the Purgatorio (18th cent.); and S. Ruggero, built in the 13th century but entirely remodeled in 1732. *Museum*: Museo e Pinacoteca Comunale.

Bisceglie. Founded in the Middle Ages, Bisceglie was fortified with walls and towers by the Normans. The medieval and modern parts of the city are distinctly separate. The principal monuments are of the Romanesque period: the single-aisled Church of S. Margherita (1197), with three tombs of the Falcone family (13th cent.); and S. Adoeno (1074), the interior of which has been completely remodeled. The Cathedral (1073–1295) has sculptured portals. The three-aisled interior was remodeled in baroque style. The crypt is Romanesque. Three rectangular towers remain of the Norman castle, built in the 11th century. The Palazzo Mazzalorsa is Renaissance in style. Outside the city is the Romanesque Church of S. Maria di Giano (11th cent.), with medieval frescoes. In the environs of Bisceglie are noteworthy megalithic remains from the Bronze Age, including dolmens and menhirs (IV, PL. 456).

Bibliog. A. Perotti, Il coro della Cattedrale di Bisceglie, Napoli nobilissima, N.S., I, 1920, pp. 97–100; M. Berucci, Studi sulla Cattedrale di Bisceglie, Palladio, N.S., VII, 1957, pp. 127–33.

Bitonto (Lat., Butuntum). This city of the Apulians was colonized by Greeks and later became a Roman municipium. Sacked by the Byzantine catapan in 975, it was rebuilt in the 11th century. The medieval nucleus is incorporated in the modern city. The Cathedral (1175–1200, restored) was modeled after the Church of S. Nicola in Bari. The decoration is lighter than that of the prototype. The portals and the rose window are delicately ornamented, as are the single-arched window in the apse and the six-arched lateral windows. The basilican interior is in pure Romanesque style. The Cathedral preserves a sculptured ambo (1229), with the inscription *Nicolaus sacerdos et protomagister*, a Romanesque baptismal font, and a pulpit assembled (1240) from fragments of the original high altar. The Abbey of S. Leo was erected in the 9th century by the Benedictines, remodeled several times, and restored in the 20th century. The abbey church preserves the 13th-century rectangular apse, which is decorated with 14th-century frescoes that combine Byzantine techniques and iconography with Romanesque forms. The Church of S. Francesco d'Assisi preserves only the façade of the structure built in 1286. S. Matteo has been restored to its 13th-century form. S. Francesco di Paola (1625; rebuilt, early 18th cent.) and S. Gaetano (1609) are baroque. The 15th-century Palazzo Sylos Labini has a Catalan-Gothic portal and a porticoed courtyard and loggia with Renaissance low reliefs. The Palazzo Sylos Calò has late-16th-century decorations. The Palazzetto Regna and the Palazzo Sylos Sersale have baroque portals. The two Gentile palaces (one now the Municipio) were designed by Luigi Castellucci (19th cent.). The Obelisco Carolino, designed in 1734 by G. A. Medrano, was completed in 1859.

Brindisi (Gr., Brentesion; Lat., Brundisium). This Adriatic city was occupied by the Romans in 266 B.C. and became a Roman colony in 246 B.C. After the Social War it became a municipium. Connected to Rome by the Via Appia (2d cent. B.C.) and by the Via Traiana (under Trajan), Brindisi was a busy commercial center. There are remains of the forum, baths, and a temple, as well as one of the two tall Roman columns that marked the end of the Via Appia. The column (perhaps dating from the 3d century of our era) has a composite capital with sculptured decoration. Dominated successively by the Goths, Lombards, and Byzantines, Brindisi was destroyed in the 9th century by Emperor Louis II. The city sprang up again at the time of the Crusades, as a port for the East. The city's development was considerably incremented under Frederick II. Later the city passed to the Angevins and the Aragonese, who did much to develop the city's fortifications. The Aragonese built the port channel for defense against the Turks.

In the old city there are a number of Romanesque buildings, but most of them were altered or restored in later centuries as a result of damage from the frequent earthquakes. Of the 12th-century Cathedral, only portions of the apse with a mosaic floor remain. The present structure dates from the 18th century. The well-preserved Church of S. Giovanni al Sepolcro was erected by the Knights Templar in the 11th century and later became the church of the Knights of the Holy Sepulcher. This curious building is circular in plan but one fourth of the circumference is closed off by a straight wall. The interior preserves a circular colonnade of eight columns and traces of 14th-century frescoes. S. Benedetto dates from 1080 but was remodeled in the 16th century and later. The campanile is Romanesque, as is the cloister of the former monastery. The Romanesque Church of S. Lucia (or SS. Trinità) has been remodeled, but the 11th-century crypt preserves Byzantinizing frescoes (12th cent.) and others of the 13th–14th century. The Church of the Cristo (1230) has alternate bands of white and gray stone on the façade. The single-nave church preserves a 13th-century painted wood sculpture of the Madonna Enthroned and a crucifix. The Church of S. Paolo was built in the 14th century but subsequently rebuilt. The façade is baroque. The most important secular structure of the Middle Ages is the castle built by Frederick II (1227). Its plan is rectangular, and there are towers on the corners. The castle was reinforced in 1481 with a barbican and four cylindrical towers. In 1550 it was further enlarged by Charles V. Other secular structures include remains of the Angevin mint, the Porta Mesagne, and the Palazzetto Balsamo (14th cent.). Of the baroque period are S. Teresa (1670) and the Palazzo Granafei-Nervegna. The Palazzo del Seminario (1720–44) houses the Biblioteca Arcivescovile "De Leo," with a number of incunabula and rare manuscripts. The Museo Provinciale "Francesco Ribezzo" contains local antiquities.

Outside the city is the Church of S. Maria del Casale (early

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

14th cent.). The façade is decorated with bands of stone of two colors. The single-aisled church preserves 14th-century frescoes.

Canosa di Puglia (Κανύσιον; Lat., Canusium). This Apulian city fell to Rome in 318 B.C. After the Social War it became a municipium. It was a colony under Antoninus Pius, when it enjoyed the favors of Herodes Atticus. The ancient city was famous for its ceramics (q.v.). Destroyed by the Lombards and then by the Saracens, the city was rebuilt in the 10th century. Little remains of the Apulian city, but hypogea of the 4th–3d century B.C. have been found. They comprised several rooms carved out of the natural tuff and decorated with painted stucco. Of the Roman period are remains of an aqueduct (probably built in the time of Herodes Atticus), baths, a temple, and an arch. Along the Via Traiana are a number of Roman tombs. The Cathedral was begun in the late 11th century and subsequently remodeled several times. The three-aisled interior has a Latin-cross plan. Of the original structure are the last two bays, the transept, and the central apse, surmounted by five small domes supported by ancient columns. Preserved are the cathedra by Romualdus (PL. 172) and the 11th-century pulpit (reassembled) by Acceptus. The crypt was remodeled in the 16th century. Outside the church is the tomb chapel of Bohemund I, prince of Antioch (d. 1111), a cubic structure surmounted by an ovoid dome resting on an octagonal drum. The walls are covered with marble slabs. The bronze doors are decorated with silver damascene in Byzantine style and Arab-style relief disks. The door is the work of Rogerius of Melfi. There are vestiges of a medieval castle. *Museum*: Museo Civico.

Scarfì, Restauro della teca di specchio di Canosa, BArte, XLIV, 1959, pp. 166–70.

Casaranello. Of the old town, which ceased to exist in the 15th century, all that survives is the three-aisled church (S. Maria della Croce), with barrel vaults and 12th–13th-century frescoes. The church incorporates the transept and dome of an earlier church, which are adorned with fine aniconic mosaics of the 5th century. These are the only Early Christian-Byzantine mosaics in Apulia.

Bibliog. A. Haseloff, I musaici di Casaranello, BArte, II, 1907; R. Bartoccini, Casaranello e i suoi mosaici, Felix Ravenna, N.S., IV, 1934, pp. 157–85.

Egnazia (Gr., Gnathia). Originally an Apulian city, Gnathia later became a Roman municipium. There are remains of walls (4th cent. B.C.), as well as of the agora and harbor constructions. Excavations of the necropolis have yielded large quantities of vases, including 4th-century B.C. Gnathia ware. Hypogeum tombs with wall paintings have also been excavated. Some of the few surviving wall paintings are now in the Museo Nazionale in Naples. There are also remains of the Roman city, including tabernae, the foundations of an arch, a forum with a Hellenistic portico, and a basilica.

Bibliog. C. Drago, EAA, s.v. Gnathia, III, 1960, pp. 967–71 (bibliog.).

Foggia. First mentioned in the 11th century, Foggia was an imperial residence under Frederick II. It has few medieval remains. The Romanesque Cathedral (founded ca. 1170), whose structure was influenced by Pisan architecture, was largely rebuilt in baroque style. Of the original structure are the lower part of the façade, a number of ornamental sculptures, and the large crypt, with 13th-century capitals. Of the palace of Frederick II (begun, 1223), only a portal arch by Bartolomeo da Foggia survives. The Palazzo De Rosa is Renaissance. The Church of Calvario (1693–1740) is baroque. The Villa Comunale, a large public garden, was laid out by Luigi Oberty in 1820. The Musei Civici contains an archaeological collection and a painting gallery.

Bibliog. C. Capuano, La cattedrale di Foggia in rapporto alle origini della città, Rass. pugliese, XXV, 1910, pp. 416–21; R. Gaggese, Foggia e la Capitanata, Bergamo, 1910; M. Biccari and M. Locco, Guida di Foggia e della provincia, Bari, 1957.

Lecce (Lat., Lupiae). Originally a Messapian city, Lupiae became a Roman municipium. It reached the peak of its development under the Antonines, when the Roman amphitheater and theater were built. Sacked by Totila in the 6th century of our era, it later came under Byzantine domination. In 1040 it fell to the Normans, becoming the chief city of the Salento. Under the Angevins and Aragonese it followed the destiny of the rest of the region. The Church of SS. Nicolò e Cataldo is the only surviving Norman monument. Founded in 1180, the original structure has survived almost unaltered, in spite of the baroque remodeling of the façade (1716), which, however, retained the 12th-century sculptured portal and rose window. The interior, which has three aisles (and a transept in the center) with pointed barrel vaulting, shows the influence of Burgundian architecture. The baroque decorations are mostly of the 17th century. Of the 15th century is the round Torre del Parco (1419). The castle (1539–48), built by G. G. dell'Acaia on a trapezoid plan, has lance-shaped bastions jutting out at the corners. S. Sebastiano (1520) has an elegant portal, as does the former Church of S. Marco (1543). S. Francesco di Paola (or S. Maria degli Angeli; 1524) is attributed to Baldassarre Peruzzi; the portal is attributed to G. Riccardi. The Arch of Triumph (Porta Napoli; 1548), designed by G. G. dell'Acaia, bears the coat of arms of Emperor Charles V. Other 16th-century structures include the Palazzo del Seggio (1592), which has two large arches below and a small loggia above, and the Palazzo Adorno (1572), with baroque decorations in the courtyard.

The city is chiefly characterized by its baroque architecture, which is sober in its structural lines but sumptuous and exuberant in its ornamentation. Sta Croce, of the 14th century, was rebuilt between 1549 and 1695 by Francesco Antonio Zimbalo, Gabriele Riccardi, and Cesare Penna. The original Romanesque structure was retained in part, but the exterior and interior decoration of the three-aisled church is baroque (II, PL. 146). S. Chiara (1694; G. Cino) has a convex façade with a horizontal coping. S. Teresa (1620–27) has an unfinished façade. S. Irene (1591–1639), attributed to Michele Coluzio, is a sober building in late-Renaissance style; the interior is baroque. The Church of the Rosario, or S. Domenico (1691–1728; G. Zimbalo), is built in the form of a Greek cross inscribed in an octagon. The façade is particularly ornate, as are the richly ornamented altars. S. Matteo (reconstructed, 1667–1700) has a façade modeled after that of Borromini's Church of S. Carlo alle Quattro Fontane in Rome. The classicizing Church of S. Maria delle Grazie (1606) was designed by Michele Coluzio. S. Antonio was built in 1586 and remodeled in the 18th century. S. Angelo (1663) and the Church of the Alcanterine (1724) are also baroque structures. The Church of the Gesù (or Buon Consiglio) was built in 1575–79 and remodeled in 1745. The Church of the Carmine was rebuilt by G. Cino in 1711–17. The Piazza del Duomo presents a harmonious ensemble of baroque edifices, including the Cathedral (rebuilt, 1659–70), the campanile by Giuseppe Zimbalo, and the episcopal palace (rebuilt, 1632). Adjacent is the Seminario (1694–1709; G. Cino), with a triple-arched window above the main portal. The courtyard has a richly decorated well in the center. There are many baroque secular buildings in Lecce, including the Municipio (formerly Palazzo Carafa, 1764–71), Palazzo Rollo, Palazzo Giromini, and the Palazzo della Prefettura (formerly a monastery, 1659–95). The Column of S. Oronzo was erected in 1666 by Giuseppe Zimbalo. The Museo Provinciale "Sigismondo Castromediano" (in the Palazzo della Prefettura) contains a large collection of Messapian and Roman antiquities. Just outside Melendugno, near Lecce, are dolmens.

Lucera (Lat., Luceria). This ancient Daunian city produced some noteworthy votive and architectural terra cottas (VII, PL. 78). It was an ally of Rome during the Second Samnite War. In 314 B.C. it became a colony, and after the Social War it became a municipium. Under Augustus it gained importance. Roman remains include the amphitheater (1st cent.). The city flourished under the Hohenstaufens and under the first Angevin rulers. The fortress of Frederick II, built in 1233, was transformed by Charles I of Anjou, who girdled it with towered walls. It is pentagonal in plan and stands on the crest of a hill outside the town proper. The Gothic

Cathedral (1300–11) is one of the best-preserved Angevin churches in southern Italy. The church preserves a cenotaph with a statue of an Angevin knight (14th cent.), a 16th-century pulpit, and frescoes by Belisario Corenzio. S. Francesco, another Angevin structure, has baroque altars. Eighteenth-century buildings are the episcopal palace, the Palazzo Lombardi, and the Church of the Carmine. The Museo Civico "Giuseppe Fiorelli" preserves local antiquities.

Manduria. One of the principal Messapian cities, Manduria was conquered by Hannibal. Destroyed by Totila in A.D. 547 and by the Saracens in A.D. 977, it was rebuilt in the 11th century with the name of Casalnuovo. It resumed its old name, Manduria, in 1789. Of the three circles of megalithic walls, several sections are well preserved. The inner wall is probably of the 5th century B.C., the middle wall of the 4th, and the outer probably of the late 3d century B.C. Beyond the walls are a number of necropolises, which have yielded local pottery with Geometric decoration and Gnathia ware. The Cathedral, originally Romanesque, was remodeled in the Renaissance. The campanile is Romanesque.

Bibliog. N. Degrassi, Manduria, FA, XII, 1957, 2836; M. D. Marin, Manduria, Ann. della Facoltà di Lettere e Filosofia dell'Università di Bari, IV, 1958, pp. 53–78; N. Degrassi, Le recenti scoperte archeologiche della provincia di Taranto, La ricerca archeologica nell'Italia meridionale, Naples, 1960, p. 119 ff.

Manfredonia. The city was founded by King Manfred in 1256 near the site of ancient Sipontum. The castle was begun by Manfred and completed under Charles I of Anjou. It consists of a rectangular fortress with four towers (three cylindrical and one rectangular) and is enclosed by rectangular walls with three cylindrical towers built in the 15th century and a pentagonal bulwark added in the 16th century. Many of the medieval buildings, including the Cathedral (rebuilt, 1680), were destroyed by the Turks in 1620. Only the Church of S. Domenico was spared. It incorporates the earlier Chapel of the Maddalena, built by Charles II. The Gothic interior of the church is decorated with late-14th-century frescoes. Next to the church is the former Dominican Monastery of S. Domenico, a 17th-century building that now houses public offices. The Palazzo di S. Chiara also dates from the 17th century. Outside Manfredonia are the remains of the city of Sipontum. The Romanesque Church of S. Maria di Siponto, the former Cathedral, is built on a square plan. The dome and external decoration show Pisan influence. The portal is adorned with Apulian Romanesque sculptures. Adjacent to the church are the remains of an Early Christian basilica, with a mosaic pavement. The Church of S. Leonardo di Siponto was erected in the 11th–12th century and restored in 1950. The exterior decoration incorporates Pisan elements. The interior has three vaulted aisles, three apses, and two small octagonal domes.

Near Manfredonia, at the Masseria Coppa Nevigata, an aëneolithic village has been excavated. At Fontanarossa, another settlement and an Apulian necropolis have been excavated.

Bibliog. A. Mosso, Stazione preistorica di Coppa Nevigata presso Manfredonia, MALinc, XIX, 1910, cols. 305–86; S. M. Monte Sant'Angelo. The town developed around the Sanctuary of S. Michele Arcangelo, which was founded, according to legend, at the end of the 5th century, after the miraculous appearance of St. Michael. The sanctuary (which was built around the Grotto of the Archangel), is irregular in shape, with chapels of various periods. It preserves many precious relics and treasures, including bronze doors made in Constantinople in 1076. The interior of the church has a rib-vaulted nave (1273) and contains a pulpit by Acceptus (1041) and a marble episcopal throne (11th cent.). At the end of the nave is the baroque Chapel of the Sacrament (rebuilt, 1690). The church has two atria (the outer one built in 1865) connected by a staircase. The octagonal campanile dates from the 13th century. The Tomba di Rotari, a 12th-century rectangular building with a semicircular dome resting on an octagonal drum, may once have been a baptistery. Adjacent are the remains of the Church of S. Pietro (reconstructed, 12th cent.). S. Maria Maggiore was reconstructed in the early 12th century and again rebuilt in 1170. The façade portal was created in 1198. The church preserves frescoes in Byzantine style (12th–13th cent.). The castle, begun under the Hohenstaufens, preserves an 11th-century pentagonal tower and two 15th-century cylindrical towers.

Otranto (Lat., Hydruntum). An ancient city, perhaps founded by Tarentine Greeks, Otranto and its port were particularly important in the 11th and 12th centuries of our era. The small town's most important monument is the Cathedral (1080–88; restored). The façade has a Gothic rose window (late 15th cent.) and an ornate baroque portal (1764). The left side of the church has a Renaissance portal by Niccolò Ferrando. The interior is basilican, with three aisles divided by columns. The church preserves a remarkable mosaic floor by a priest named Pantaleone (1165–66; X, PL. 190). Below the presbytery is a crypt (consecrated, 1088) with five aisles and three semicircular apses. The small Byzantine Church of S. Pietro (10th–11th cent.) has three semicircular apses and a cylindrical dome. There are numerous frescoes of various periods. The castle was built by Ferdinand of Aragon in 1485–98. It is rectangular and has cylindrical towers on the corners. Near Otranto are the ruins of the 12th-century Church of S. Nicola di Casole, the only remaining portion of a large Basilian hermitage destroyed by the Turks in 1480.

Ruvo di Puglia ('Ρύψ; Lat., Rubi). This important Peucetian city became a Roman municipium and a station on the Via Traiana. It is known for its large production of Italiote ceramics. Excavations have yielded rich finds, including tomb paintings (III, PL. 299; V, PL. 45) and fine bronzes (I, PLS. 350, 439). Tradition has it that the city was destroyed by the Goths in A.D. 463. The city was rebuilt in the Norman period. The Cathedral (12th–13th cent.) has an elegant façade with relieving arches on half columns framing the three portals. The central portal is elaborately carved (PL. 172). Above the central portal is a double-arched window, and the façade is topped by a fine rose window. Running around the exterior of the church is a series of small arches supported by corbels with sculptured heads. This motif is repeated in the interior of the church. The Museo Jatta has a fine collection of ancient ceramics.

Taranto (Τάρας; Lat., Tarentum). From early times an important port, according to tradition the city was founded (on a site that had been inhabited in prehistoric times) at the end of the 8th century B.C. by Spartan colonists. The city was long at war with the Messapians and Iapygians and later fought various cities of Magna Graecia. The city's most prosperous period was the 4th century B.C., under the rule of Archytas of Tarentum. It sided with Pyrrhus in the war against Rome. It became a colony in 125 B.C. and a municipium after the Social War. There are remains of a temple (early 6th cent. B.C.), vestiges of a wall (second half of 5th cent. B.C.), an amphitheater, Roman baths, and sanctuaries. Attic and Italiote ceramics have been recovered from necropolises, hypogea (some painted), and isolated tombs (VII, PLS. 56, 74).

The modern city comprises the Old City, the New City, and the Borgo. The Old City, with irregular narrow streets, is situated on an island formed by two canals. The New City and the industrial Borgo are joined to the Old City by bridges. The basilican Cathedral, founded in 1071, was much remodeled. It has been restored to its original appearance, except for the baroque façade. On the lateral walls some of the Romanesque decoration has been uncovered. The interior, with three aisles separated by two rows of ancient columns, preserves parts of the 11th-century mosaic

floor. The crypt preserves remains of Byzantine-style frescoes (12th cent.). The baroque Chapel of S. Cataldo (17th–18th cent.) is richly decorated with inlaid marbles and stuccoes. S. Domenico Maggiore (rebuilt, 1302; later remodeled) preserves the original Gothic façade above the baroque double staircase. The castle, built by Ferdinand of Aragon (1481–92) over older fortifications and enlarged in 1577, has four large cylindrical towers and bastions. In the New City, with its broad streets and squares, are the Municipio (D. Conversano, 1886), the Banca d'Italia (C. Bazzani), and the Palazzo degli Uffici (G. Galeone, 1896). On the sea front (Lungomare) are the Post Office (C. Bazzani) and the Palazzo del Governo (A. Brasini). The Museo Nazionale houses the most important collections of Apulian antiquities, including prehistoric material (mainly vases), Greek and Italiote ceramics, terra cottas, sculpture, and gold- and silverwork.

Trani (Lat., Turenum, or Tarenum). Although the city may have been founded in the 3d or 4th century of our era, it became important only after the destruction of Canosa di Puglia in the 9th century. Few Roman remains have been found. The Cathedral (restored) was begun in 1096 on the site of the Church of S. Maria della Scala, or Episcopio, which is known to have existed as early as the 7th century. The Cathedral was erected in several phases, the most intensive being the period 1159–86. The Cathedral was completed in the 13th century. The plan is traditional Apulian Romanesque. The façade has a steep gable. The central portal is richly carved, and the double doors, by Barisanus of Trani (1175–79; IX, PL. 508), are of wood covered with bronze. On the right side of the façade is the campanile, about 190 ft. high (PL. 172). The lower part was built in the 13th century, the upper part in the 14th century. The interior of the Cathedral is divided into three aisles by two rows of paired columns (the only example in Apulia). In the presbytery are sections of a Byzantine floor mosaic (11th cent.). The Crypt of S. Nicola has a ceiling supported by 28 columns (I, PL. 400). The Romanesque Church of Ognissanti (12th cent.) is preceded by a double portico. The central portal is sculptured with elaborate fantastic motifs. S. Francesco (1176–84; restored, 1897) is a three-aisled church. S. Andrea is a small basilica of Byzantine type (11th cent.). The plan of the church is that of a Greek cross inscribed within a rectangle. S. Giacomo was originally Romanesque. The façade preserves three orders of corbels sculptured with human and animal figures. The castle was begun under Frederick II, in 1233. It was completed in 1249 and remodeled in the 15th and 16th centuries. The late-Gothic Palazzo Caccetta (1458) has a fine portal and Gothic windows.

Troia. The city was built on the site of the Apulian Aecae. Under Septimius Severus, it became a colony and a station on the Via Traiana. The present city began its history as a Byzantine fortress founded in A.D. 1019 on the ruins of the Roman city. The architecture of the Romanesque Cathedral, founded in 1093 and completed in the 13th century, incorporates Byzantine and Islamic elements with Pisan influences. The elegant façade, with a rose window, has bronze doors by Oderisius of Benevento (1119). On the right wall is another bronze door by Oderisius (1127). The basilican-plan church preserves a carved marble pulpit (1169). S. Basilio (11th cent.) is also a Romanesque church.

Lucania (or *Basilicata*). This predominantly mountainous region has two short stretches of coastline on the Ionian and Tyrrhenian seas. There is considerable evidence of prehistoric and protohistoric cultures and artistic activity, especially in the area around Matera. (These cultures form part of the Apulian complex.) In the 8th century B.C. several Greek colonies were established on the Ionian coast (Metapontion, Siris), and many of the indigenous fortified settlements of the interior were subjected to Hellenic influences. In the 6th century B.C. the region was invaded by the Lucani, an Italic people (whence the name Lucania). The name Basilicata is of Byzantine origin. Despite its relative isolation, the region flourished under the Norman and Hohenstaufen dynasties, the majority of important monuments dating from the 11th to the 13th century.

Acerenza (Lat., Aceruntia, Acerentia, Acheruntia, Acherontia). Believed to have been an Oscan settlement, conquered by the Romans in 318 B.C., this was a colonia not later than the end of the Republic. It was the center of long political struggles after the 5th century. In the 9th century it came under Byzantine and in the 11th century under Norman rule, declining in importance in modern times. The Cathedral, one of the most noteworthy medieval monuments of the region, is of the 12th century (the foundations may be older). The façade, remodeled in 1524, retains the central portal in Apulian Romanesque style. The interior is a Latin cross, with an ambulatory behind the presbytery and chapels in the apses showing French influence. Of the 11th or 12th century are the churches of SS. Annunziata and of S. Laviero (with arcades and dome). The Palazzo Saluzzi is of the 18th century.

Grumentum. The site of an ancient city of the Lucanians near modern Grumento Nova. Destroyed by the Romans during the Social War, it later became a municipium and then a colonia. It was again destroyed by the Saracens in the 10th or 11th century. There are remains of 1st-century B.C. walls, a theater of the period of Augustus or Tiberius, an amphitheater, thermae, an aqueduct, and funerary monuments. The "Bronze of Siris," a fine cuirass (Br. Mus.) was found here in 1820.

Bibliog. E. Magaldi, Grumento, Arch. storico per la Calabria e la Lucania, III, 1933, pp. 325–59; C. Valente, Zona archeologica di Grumentum, NSc, 7th ser., II, 1941, p. 251; P. C. Irsina (formerly Montepeloso). Perhaps the ancient Vertinae (Οὐερτῖνσι), which declined and was superseded by Irsum, on Mount Irsi, 5½ miles east, where Hellenistic-Roman objects have come to light. It was a bulwark of the Byzantine defense against the Normans, who conquered it in the 11th century. Destroyed by Roger II in 1133, it was rebuilt in the 13th century. The Cathedral (13th cent., on foundations of the 10th) was remodeled in 1777. The façade is somber; the interior, in the form of a Latin cross, has three aisles, a dome above the crossing, and a crypt. The only remaining part of the original structure is the campanile, with pointed double-arched windows. The former monastery of S. Francesco (now the town hall) incorporates the remains of a Norman castle remodeled by Frederick II in 1228 and enlarged after 1531. The adjoining church, S. Francesco, was rebuilt after 1531 (façade remodeled 1717, incorporating

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

two 13th-cent. columns). The crypt, originally an oratory built in 1110 (remodeled, 1228), within a quadrangular tower of the castle, has 14th-century frescoes by a Neapolitan artist. Noteworthy also are S. Andrea (1566), the Church of the Purgatorio (1638), and the episcopal palace (1638). The Museo Ianora contains prehistoric artifacts, Italiote vases, coins and medals.

In the vicinity are the Grotta di S. Lucia, a Basilian chapel with traces of frescoes; and, on Mount Irsi, remains of the Hellenistic city, the Church of S. Maria d'Irsi (11th cent.; many times remodeled), and ruins of a castle.

Lagopesole. This village is noted for a castle begun by Frederick II in 1242 and completed by Charles I of Anjou in 1278. The plan is rectangular, with rectangular towers on the corners and a massive keep of rough ashlar.

Bibliog. G. Fortunato, Il Castello di Lagopesole, Trani, 1902; T. Claps, Il castello di Lagopesole e una singolare leggenda su Federico Barbarossa, Arch. storico per la Calabria e la Lucania, III, 1933, pp. 461–71.

Matera (Lat., Mateola?). In an area inhabited since the Paleolithic period, the modern city is of obscure origin. It is known to have been destroyed five times before the 11th century. In 1064 it came under Norman rule, later passing to the Aragonese, forming part of Apulia. It was the capital of Basilicata from 1663 to 1806. The salient characteristics of the modern city are the two gullies (*Sassi*) with dwellings hewn out of the rock, one above the other, the only masonry construction often being the façade. The streets on the higher level are narrow and twisting; many houses have baroque galleries and balconies resting on elaborately carved corbels. The city is dominated by the unfinished castle, with three cylindrical towers and bastions (late 15th cent., incorporating sections of an older Norman castle). The Cathedral (1268–70) is in Apulian Romanesque style. The façade, in three sections (the central one very high, surmounted by a tympanum), is decorated with small blind arcades, a rose window, and a series of blind corbeled arches. It is articulated by pilaster strips, which are also found on the lateral walls. The interior (remodeled, 1627 and 1776) is baroque but retains the original columns; it preserves a carved stone reredos by Altobello Persio da Matera (1539), a polychrome stone Nativity by Altobello and Sannazaro d'Alessano (1534), and carved wooden choir stalls by Giovanni Tantino (1453). Within a courtyard entered through the Cathedral is the little Church of S. Maria di Costantinopoli (13th cent.). Other 13th-century churches include S. Giovanni Battista (restored), with Apulian, Burgundian, and Oriental elements; S. Domenico, retaining part of the original façade and a Romanesque portal; and S. Pietro Barisano, partly carved out of the rock (17th-cent. façade and Gothic campanile). The city contains a number of baroque churches, among them the Carmelo (1608–10), with five arches and a rose window on the façade; S. Pietro Caveoso (1656; remodeled, 1752); S. Francesco d'Assisi (1670), built over the 11th-century Church of SS. Pietro e Paolo (vestiges of frescoes); SS. Lucia e Agata (18th cent.), with a set-back baroque façade; the Church of the Purgatorio (1747); and S. Agostino (1750), with a façade in the style of Borromini. Secular buildings of note include the Palazzo del Liceo Duni and Convitto Nazionale, in the former Seminary (1668–72); the Palazzo di Giustizia, a former convent, with an 18th-century façade; the Palazzo Bronzini Padula (1779); the Palazzo Giudicepietri, incorporating the southern corner of the old Norman castle, decorated with courses of diamond-pointed ashlar; and the Municipio, with a monumental portal (1779). The modern urban renewal plan, drawn up by Luigi Piccinato in 1954, includes the clearance of the slum zones of the *Sassi* and the building of new quarters. The Museo Nazionale Domenico Ridola, in the former monastery of S. Chiara (1698), houses local archaeological finds.

The neighborhood of Matera is rich in prehistoric sites, especially of the Neolithic period. Among these are the fortified villages of Murgia Timone, Murgecchia, Tirlecchia, and Serra d'Alto, which have yielded painted pottery. Other sites, such as Timmari (a village with a necropolis), Croccia Cognato, and Garaguso are typical villages of Bronze and Iron Age cultures, which lasted well into the classical age. Also in the environs are many rock-cut underground churches of the Byzantine period (some decorated with frescoes), including S. Maria de Idris, above another church of the 8th century; S. Barbara; Cappuccino Vecchio; Cristo alla Gravinella (17th-cent. façade); S. Maria della Valle (or Balea, Vaglia), with a Romanesque façade. Spirito Santo (known also as La Palomba), built between two rocks, has a Romanesque façade with a rose window.

Melfi. The town is built of lava on a secondary crater of Mount Vulture, an extinct volcano. It is of Italic origin. Of minor importance in Roman times, it flourished in the Middle Ages under Byzantine, then Norman rule. It was sacked by the emperor Frederick I in 1167 but became a favorite residence of Frederick II. Devastated in 1528 by the French army of Lautrec, it never recovered its former prosperity. There are few medieval remains. The Cathedral (founded 1153) has been remodeled numerous times. The campanile (1153) retains its original form, save for the modern octagonal upper story and pinnacle. It has two orders of Romanesque double-arched windows decorated with geometric designs and two griffins (emblem of the Norman kings) in contrasting colored lava. There are medieval portals in the churches of S. Andrea (12th cent.), S. Maria la Nuova (13th cent.), and S. Lucia (14th cent.), and in a baronial palace (13th cent.). The Castle, of Norman origin, rebuilt by Charles I (1278–81), remodeled in the 16th century, and restored after 1851, is on a quadrangular plan with seven towers and is surrounded by a moat. The Porta Venosina (13th cent.), with a Gothic arch, stands between two towers and walls of the Spanish viceroyal period. In the courtyard of the Vescovado is the Rapolla sarcophagus, Roman, of the reign of Marcus Aurelius (2d cent.). The Antiquarium (in the Municipio) has archaeological objects and Hellenistic vases.

In the vicinity are a number of underground churches, some with remains of frescoes — S. Lucia (1192); Madonna delle Spinelle; and S. Margherita (13th cent., restored). S. Maria del Monte (12th cent.) is a small Benedictine church with a single aisle, cross-vaulted ceiling, and campanile.

Metaponto (Gr., Μεταπουτιον; Lat., Metapontum). A Greek colony was founded here in the first half of the 8th century B.C. The town came under the domination of Taras in the 3d century B.C. It was probably abandoned in the late Imperial period and finally destroyed by the Arabs in the Middle Ages. Aerial protography has revealed the perimeter of the walls (parts of which can be seen on the ground), as well as the layout of the city, on a checkerboard pattern. Still extant are the foundations and portions of the walls of the Temple of Apollo (early 5th cent. B.C.) and necropolises of the 6th and 5th centuries B.C. with tombs covered with slabs and of the Hellenistic period with graves roofed with tiles. About 1 mile north of the city are the remains of a Doric temple of the late 6th century, known as "Tavole Palatine" (VII, pl. 54).

Potenza (Lat., Potentia). Probably of Lucanian or Picenian origin, the settlement became a Roman municipium in the 2d century B.C. The ancient city was situated on the left bank of the Basento; the move to the present site on a high ridge took place in the Middle Ages. The present city consists of the medieval part, extending along the ridge and divided by the Via Pretoria, where the principal edifices rise, and modern quarters with wide streets and residential and agricultural suburbs at each end. The Church of S. Michele Arcangelo (11th–12th cent.) retains the medieval exterior. The interior has been remodeled several times. The Cathedral (built 1197–1200; rebuilt, 1783–99 by Antonio Magri) has both the rose window on the façade and the apse of the original 12th-century structure. S. Francesco (1274) has a 15th-century carved wooden door with Gothic decorations and two 14th-century portals. The single-aisled interior has a Gothic apse and contains a Renaissance marble tomb and a 13th-century Madonna. The Museo Provinciale Lucano houses archaeological, medieval, contemporary, and folk collections.

Rapolla (anc. Strapellum?). In the 10th century, St. Vitalis founded a Basilian monastery in the locality. The town (probably fortified with a castle) was conquered by the Normans in 1042. In was devastated twice during the 12th century but each time was rebuilt. In 1851 and 1930 it suffered damage by earthquakes. The Church of S. Lucia, of Norman origin, shows definite Byzantine influences; the interior has three aisles with two crossings, each surmounted by an elliptical cupola, and a semicircular apse. The Cathedral, rebuilt in the 13th century in Cistercian Gothic style, was restored after the earthquake of 1930. The surviving Romanesque portal is by Melchiorre da Montalbano (1253). The quadrangular campanile dates from 1209. There are many houses and Basilian grottoes hewn from the volcanic tuff, both in the town and the surroundings. The Church of the Crocifisso is carved from the rock and contains 14th-century frescoes.

Bibliog. F. Chiaromonte, Cenno storico sulla chiesa vescovile di Rapolla, Naples, 1848; E. Bertaux, L'art dans l'Italie méridionale, II, Paris, 1904, pp. 784–86.

Venosa (Lat., Venusia). In 291 B.C. a Roman colonia was established. Situated between the territories of the Samnites, Lucani, and Bruttii, it was an important Roman stronghold in the later Samnite wars. The Arabs sacked the town in the 9th and 10th centuries. It came under Norman rule in 1041, was destroyed in 1133, but rose again. It has suffered frequent damage by earthquake. Of the Roman period remain an amphitheater; the so-called "House of Horace," a circular building, perhaps originally baths; and Jewish catacombs (2d–5th cent.) with inscriptions. The most important medieval monument is the Abbey (Abbazia della Trinità), founded in the 11th century by Benedictines under Count Drogo. It comprises the abbatial building (restored) and two churches joined longitudinally, the second unfinished. The older church (completed, 1098; restored several times) retains portions of a late 13th-century portal. The basilican interior has vestiges of frescoes. The second church (12th cent.) is attached to the eastern end of the older one. The plan, which shows influences of French Cistercian architecture, is a Latin cross, with three aisles and a deep presbytery, behind which is an ambulatory with three radiating apses. The Cathedral (1470–1502) has been much disfigured. The façade has a marble portal by Cola da Conza (1512). The three aisles of the interior are divided by pilasters supporting Gothic arches. S. Biagio and S. Maria della Scala are both of the 15th century. The Castle (1470) is quadrangular, with cylindrical towers at the corners. The walls and towers of the town also date from the 15th century. Local prehistoric material is exhibited in the Collezione Preistorica Briscese.

Calabria. Because of its location Calabria has been since prehistoric times (paleolithic rock drawings near Papasidero) a bridge to Sicily. Here lived the Siculi; the Italii, who gave the name to a part of the region and later to the whole of Italy; and the Bruttii (Brettii), whence Bruttium, the name by which the region was known in antiquity. In the area were numerous Greek colonies, which participated actively in the development of the civilization and art of Magna Graecia, especially in the 6th and 5th centuries B.C. After the collapse of the Roman Empire in the West, Calabria once more witnessed a limited cultural flowering in the early Middle Ages under Byzantine rule, a revival linked with the spread of Basilian monasticism, and later under the Normans. Byzantine influence was decisive in the development of the regional architecture between the 9th and 12th centuries. During the baroque period Naples was influential.

Catanzaro. City of Byzantine origin. Among the important churches are S. Domenico (late 16th cent.), with an oratory decorated with 17th-century stucco and inlay; the Immacolata (rebuilt 1765), with baroque façade; the Church of the Monte dei Morti, with a very ornate 18th-century portal; Church of the Osservanza, a small edifice containing a marble *Madonna della Ginestra* by Antonello Gaggini (1508) and works by Giovanni da Reggio (1650). Two noteworthy buildings in the neoclassic style are the Cathedral (rebuilt 19th cent.) and the Teatro Comunale (1818). The Museo Provinciale contains archaeological finds and paintings by artists of southern Italy.

Near Catanzaro Marina are the ruins of the Roccelletta (S. Maria) of the Bishop of Squillace, a Norman basilica of the 11th century.

Bibliog. G. Foderaro, La Basilica della Roccelletta, Arte e storia, IX, 1890, pp. 97–101; E. Caviglia, La Roccella del Vescovo di Squillace, Rass. d'arte, III, 1903, pp. 51–57; G. Mazzocca, Teatro Comunale, Palladio, II, 1938, p. 101.

Caulonia (Καυλωνία). Perhaps established as a colony of the Achaian settlement Kroton (7th cent. B.C.), on the promontory Punta Stilo, Caulonia was a member of the Italiote league and subsequently was largely destroyed by Dionysius the Elder of Syracuse in 389 B.C. Some sectors survived this conquest and destruction, and much of the city was rebuilt at the end of the 4th century B.C. Remains include walls with towers, Hellenistic houses, and Christian tombs.

Bibliog. P. Orsi, Caulonia, MALinc, XXIII, 1915, cols. 685–948, XXIX, 1924, cols. 409–90; A. De Franciscis, Scavi e scoperte nel territorio dell'antica Caulonia, FA, X, 1955, 1831; EAA, s.v.

Cosenza (Lat., Consentia, Cosentia Bruttiorum). Cosenza was the most important town of the Bruttii. A river divides the city into two parts — the older quarter on the steep slope of Colle Pancrazio, and the modern on the level valley floor to the north, laid out on a regular checkerboard plan. In 204 B.C. the city fell to Rome. In the Middle Ages the city grew in size and importance, and political events, especially during the Angevin period, forged links to Naples. The foundation of its Academy in the 16th century made

UP State Museum, Lucknow

Cosenza an important intellectual center. The castle on the summit of Colle Pancrazio was built by the Normans, and then was enlarged and fortified by the Emperor Frederick II, who added the polygonal tower and the splay windows (with later alterations). The Church of S. Francesco d'Assisi (early 13th cent.) retains the portal, a chapel, and an adjoining cloister from the original Gothic construction. The old quarter (15th cent.), between S. Francesco and the Crati, has vestiges of a Roman wall and is characterized by architectural elements of Neapolitan and Catalan derivation, especially in the portals with surbased arches. The Cathedral, built in Cistercian Gothic style (1185–1222), was remodeled in the 18th century, and a pseudo-Gothic façade was added in 1831. Of the original construction it retains three Gothic portals and the large central rose window (restored). The interior has three aisles, divided by piers supporting semicircular arches, and three apses. Within is the tomb of Isabella of Aragon (d. 1271), the work of a French sculptor. S. Domenico (1449) was remodeled in the 18th century with a baroque dome but retains the original façade, with a Gothic porch and rose window. Part of the apse is also from the original structure. The former convent adjoining the Cathedral has a 15th-century cloister. S. Maria di Costantinopoli (deconsecrated), rebuilt in the 17th century, contains several paintings by Willem Borremans. In the Church of the Cappuccinelle is an *Immaculate Conception* by P. Negrone (1558). The treasury of the archdiocese contains a Byzantine reliquary in the form of a cross (II, PL. 485), and the Museo Civico has a varied collection.

Crotone (Κρότων; Lat., Crotona). This was originally a Greek colony, founded about 710 B.C. by Achaians and Corinthians. It was a famous seat of learning, renowned especially for medicine and philosophy — Pythagoras lived and taught there for 20 years. Its fine harbor made it wealthy, particularly after the destruction of Sybaris in 510 B.C. In the 3d century B.C. the city became Roman, and in 194 B.C. a colonia was established. In wars between the Goths and the Byzantine Empire in the 5th and 6th centuries, Crotone was an important Byzantine fortress. In the 16th century it was heavily fortified by the Spanish viceroy Pedro de Toledo. From the Greek period, only traces of the walls, port installations, and a few houses remain. A necropolis of the 3d and 4th centuries is testimony to the Roman dominion. The Cathedral is of the 16th century, with a 19th-century chapel containing the *Madonna di Capocolonna*, a Byzantine painting on wood. The castle, with massive fortifications, was built on the site of the Greek acropolis in 1541 and incorporated much ancient material; it has two cylindrical towers, barbicans, and vestiges of a moat. The Palazzo Barracco dates from the 18th century. The Museo Civico in the castle contains prehistoric and antique material, coins, and inscriptions.

On Capo Colonna (anc. Lacinium Promontorium), to the south, are the remains of the great Italiote sanctuary of Hera Lacinia. These consist of a single standing column and part of the stylobate of a Doric temple (late 6th or early 5th cent. B.C.), from which important fictile revetments have been recovered.

Gerace. Gerace was founded in the 7th century by refugees from Locri. It was a flourishing Norman town. The Cathedral (mid-11th cent.) was remodeled in 1222 and restored thereafter. It is the largest church in Calabria, in the form of a Latin cross with an elaborate transept; its three aisles are separated by reused columns (perhaps from the temples of Locri), interspersed with piers. There are three apses and a vast crypt with a ceiling supported by columns also taken from Locri. Other notable churches are S. Giovannello, a small Norman church with a semicircular apse; S. Francesco (1252), in Cistercian Gothic style, very much remodeled, with remains of the cloister; and S. Anna and S. Caterina, both containing baroque works of art. Atop a rocky eminence is the castle (frequently rebuilt) with 15th-century bastions.

Locri (Λόκροι Ἐπιζεφύριοι). Magna Graecian colony founded in the 7th century B.C. (according to Eusebius, 673 B.C.). Famous for its written code of laws, associated with Zaleucus, Lokroi was the ally of Syracuse against the Italiote league in 424 B.C. and against Athens in 415–413 B.C. In the late 3d century B.C. it was garrisoned by the Romans, and under the Empire the city declined, becoming little more than a village. It was destroyed by the Arabs in the 7th century, and the surviving inhabitants took refuge at Gerace. Scant remains of the circuit of Greek walls are visible. To the north is an archaic necropolis, with pre-Greek graves that contained Greek Geometric vases antedating the colonization. Excavations have revealed portions of four temples. The Ionic temple (5th cent. B.C.) in the Marasà sector, believed to be built above an archaic one of the 7th century B.C., yielded a marble acroterial group representing the Dioscuri (Naples, Mus. Naz.). A Doric temple (late 6th cent. B.C.) near Casa Marafioti was the source of a fictile acroterium, depicting a youth riding a horse supported by a sphinx. Locri was the site of a celebrated sanctuary of Persephone, and many terra-cotta pinaces have been found in the vicinity (V, PL. 429; VII, PL. 75). Other excavations have disclosed a Greek theater and residential quarters. A great ancient center of bronzeworking, Locri has furnished many examples of this craft (VII, PLS. 73, 79), especially mirrors and vases. The Museo Civico holds archaeological material from the ancient city and vicinity.

Medma (Μέδμα, Μèσμα). Founded by colonists from Lokroi in the 6th century B.C., Medma was located on a hill that is the site of modern Rosarno, on the left bank of the Mesima River. It may have been destroyed during the war against Hannibal (ca. 210 B.C.). The site is noteworthy for the excellence of its votive terra cottas from a sanctuary of Persephone and Kore, especially busts of the tutelary goddesses and equestrian figures, as well as for models of buildings, important sources for the study of archaic architecture.

Morano Calabro (anc. Summuranum). Morano Calabro is built on a hill dominated by the ruins of a Norman castle. The Church of S. Bernardino (1452, remodeled 17th cent.) has an ogival portal, a single-aisled interior with a wood-beamed ceiling of Venetian type, and a polyptych by Bartolomeo Vivarini (1477). The Collegiata della Maddalena, one of the finest examples of Calabrian baroque architecture, contains a *Madonna and Child* by Antonello Gaggini (1505). The Church of S. Pietro contains sculpture by Pietro Bernini.

Reggio di Calabria (Ῥήγιον; Lat., Rhegium). Founded in the 8th century B.C. by Chalcidian and Messenian Greeks, the city was de-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

stroyed in 387/386 B.C. by the Syracusans and was rebuilt by Dionysius II a few years later. In the 3d century B.C. Rhegion was an ally of Rome; it then became a municipium during the Social War, but retained its Greek character. From the Greek city, portions of the walls and temple areas still exist. The remains of a sanctuary near the Vicolo Griso Laboccetta are particularly significant because they have yielded numerous terra-cotta architectural fragments and archaic votive material. There are traces of a Hellenistic odeum, and from the Roman period date parts of several thermae and houses. In modern times the black-figured ceramics of the 6th century B.C. known as "Chalcidian" ware have been attributed to potters from Greek Rhegion.

The present-day city has a completely modern aspect because of reconstruction after the earthquake of 1908 and the bombardments of 1943. The plan is regular, with long rectilinear streets paralleling the sea front, and earthquake-proof houses are a common feature. In the Church of the Ottimati four columns and some pavements are all that remain of the Norman construction. The castle has a section of walls of the Aragonese period (15th cent.) and towers. The Cathedral is of modern origin, having been reconstructed in an ornate Romanesque style. The large chapel of the SS. Sacramento has retained its 17th- and 18th-century polychrome decoration. The Neo-Romanesque Church of S. Agostino contains a reredos by S. Conca. The Palazzo Municipale was designed by E. Basile; the Palazzo della Prefettura (del Governo), by G. Zani; the Palazzo della Provincia, by C. Autore; the Palazzo di Giustizia, by P. Farinelli; and S. Giorgio della Vittoria, by C. Autore. The Museo Nazionale (M. Piacentini) contains prehistoric material and archaeological and artistic documentation from all the Greek centers of ancient Calabria. Of particular importance are terra cottas (VII, PL. 62) and vases from Reggio, fictile pinaces and bronzes from Locri, terra cottas from Medma, and the Apollo Alaeus of Ciro. The Museum also has medieval and modern sections (works by Antonello da Messina).

Rossano (Lat., Roscianum). Traces of the Roman period exist in the Sant'Antonio sector. In the Byzantine period Rossano was the most important city in Calabria. The following churches date from this period: S. Panaghia, with remains of frescoes; S. Nicola al Vallone; and S. Maria del Piliere. In the southeast quarter of the town is the Church of S. Marco, the oldest part of which (11th cent.) is similar to the Cattolica at Stilo — square, with five small cupolas on drums, and three apses. Portions of contemporaneous frescoes have survived in the interior. The Cathedral (Assunta), restored in baroque form, has a façade by F. Salvatori that was completed in 1914; a few traces of the original Gothic structure can be seen. The interior contains a fresco of the *Madonna Achiropita* dating from the 11th or 12th century. S. Bernardino, built in the mid-15th century, was afterward remodeled in baroque style. The Museo Arcivescovile holds a manuscript collection that includes the celebrated *Codex purpureus rossanensis* (X, PL. 67), containing the Gospels of St. Matthew and St. Mark illustrated with miniatures on purple parchment, probably a Syrian work of the 6th century.

Approximately 3 miles from Rossano is the Norman Church of S. Maria del Patir (12th cent.), basilican in form and triapsidal. The interior has a 12th-century mosaic floor bearing animal designs.

Laurent, Charles II d'Anjou et l'Abbaye du Patir, S. bizantini e neoellenici, IX, 1957, pp. 259–63.

Santa Severina. Situated on a hill at the site of the Greco-Roman city of Siberene (Σιβερηνή), the town of Santa Severina was subject to both Byzantine and Norman rule. The castle dates from the latter period but was enlarged at later times. Among the notable Byzantine monuments is the baptistery (8th–9th cent.) attached to the Cathedral; a circular building, it is surmounted by a ribbed dome supported on eight columns (restored). The Cathedral (S. Anastasia) was built in the late 13th century but later was extensively remodeled. The Church of S. Filomena (11th–12th cent.) combines Byzantine elements such as the dome, prothesis, and diaconicon with portals of Norman decorative type. It is built over a lower church known as S. Maria del Pozzo. In the "Grecia" quarter (so called because of the Albanian inhabitants who emigrated there in the 15th century) are remains of two small churches: S. Pietro and S. Nicola, with vestiges of frescoes.

BIBLIOG. Philipp, RE, s.v. Siberene, 2d ser., IV, 1923, col. 2070; P. Lojacono, Sul restauro del Battistero di S. Severina, BArte, XXVIII, 1934–35, pp. 174–85; B. Cappelli, Rossano bizantina minore, Arch. storico per la Calabria e la Lucania, XXIV, 1955, pp. 31–53.

Stilo. Founded in the 7th century, it was the center of a number of Basilian hermitages and monasteries. The earthquake of 1783 destroyed the town almost completely. The most important local monument is the Cattolica (restored); a small 10th-century church of Eastern derivation, it has the form of a free cross and is triapsidal, with five small cupolas and traces of contemporaneous frescoes in Byzantine style. The 14th-century Cathedral retains only the portal, with a pointed arch, from the original structure.

Near Stilo stands the Basilian Church of S. Giovanni Vecchio; basilican in form, it is preceded by an atrium. The interior contains frescoes in a Byzantine manner. Grottoes once used as hermitages are found in the cliffs of Mount Consolino, on the summit of which lie the ruins of a late medieval castle.

Sybaris (Σύβαρις). An Achaian Greek colony near the Ionian coast, ancient Sybaris (near modern Sibari) was situated between the Crati and Cosile rivers. Achaian Sybaris flourished in a providential manner, especially after the destruction of Siris. In 510 B.C. the city was destroyed by Kroton, and the inhabitants fled to Laos, Skidros, and Poseidonia (Paestum). Intervention by Poseidonia seems to have made possible the temporary resettlement of a few Sybarites who had remained nearby, but this short-lived community was also destroyed by Kroton. About 445 B.C. the city rose once more as an Athenian colony, taking the name of Thourioi (Θούριοι). The surviving Sybarites founded a new Sybaris on the Traente River (anc. Trais), in the vicinity of modern Castiglione di Paludi, from which walls of the 4th century B.C., a theater, and a necropolis have come to light. Vestiges of a wall (perhaps fortifications) and a hydraulic installation on the banks of the Crati have been attributed to the Athenian-sponsored Thourioi. The submerged site of the first Sybaris has lately been identified at the mouth of the Crati River.

Tropea. Founded in ancient times, this city on the Tyrrhenian coast became the seat of a bishop sometime in the 4th or 5th century and subsequently flourished under Angevin and Aragonese domination. The 11th-century Cathedral holds Early Christian remains. The exterior decoration along the sides and that of the apses show Sicilian-Norman influence. Rebuilt in the 16th century, the Cathedral was restored according to the original design in 1928. In the episcopal palace are displayed remains of the 13th and 14th centuries, as well as a chapel, with 15th-century frescoes. On a rock near the shore is the small Church of S. Maria dell'Isola, with Gothic remains. The Church of the Annunziata represents the type of church built by the Minorites in the second half of the 15th century, but it has been remodeled. The Church of S. Francesco d'Assisi (rebuilt 1661) incorporates a 14th-century Gothic chapel, formerly an oratory, decorated with frescoes. The Palazzo Toraldo contains a collection of Christian inscriptions of the 4th and 5th cnturies; and the Antiquarium houses other local finds.

Vibo Valentia (Ἱππώνιον). Hipponion was founded as a colony of Italiote Lokroi, on the site of an older Siculan settlement from which a necropolis has been discovered. Destroyed by Dionysius the Elder in 388 B.C., the city was later rebuilt but was captured by the Bruttii in 356 B.C. In 192 B.C. it became a Roman colonia, and afterward a municipium. There are important remains of the Greek walls, of a Doric peripteral temple *in antis* (late 6th–early 5th cent.), and of three other temples in the area. In Byzantine times a trenched camp was built on the site. The city was destroyed by the Arabs and was rebuilt by Frederick II in 1235 as Monteleone, the name by which it was known until 1928, when the old Roman name was reassumed. The castle, of Norman origin, was enlarged by the Hohenstaufens and the Angevins. The Renaissance Church of S. Michele (1519) has a façade and side walls with fluted pilasters on the exterior and a bell tower built in 1671. The façade of the Collegiata di S. Leone Luca, or Leoluca (1680–1723), is set between two 19th-century towers. The interior, in the form of a single-aisled Latin cross, contains statues by Antonello Gaggini (1524). The 18th-century Church of the Rosario incorporates a Gothic chapel of the Angevin period (late 13th cent.).

Sardinia (It., Sardegna). The protohistoric period differs both ethnologically and culturally from that of continental Italy. The island contains a number of monumental remains of the period (IX, pls. 401, 402), and certain ancient customs and geographical names survive today. The earliest culture was aëneolithic, characterized by rock-cut tombs, pottery, and schematic statuettes. The succeeding Bronze Age culture, the nuraghe civilization, lasted from the mid-2d to the mid-1st millennium B.C. It takes its name from the peculiar structures in the form of a truncated cone that are found all over the island. This period also produced a considerable quantity of bronze statuettes (IX, pls. 403, 404). In the 8th century B.C. the island was partially colonized by Phoenicians and Carthaginians. There are many Punic remains. In 283 B.C. Sardinia became subject to Rome and remained Roman until the 5th century, when it was conquered by the Vandals. In 534 it was conquered by the Eastern Roman Empire. Between the 11th and 14th centuries Pisa and Genoa disputed control of the island, and this period is marked by a considerable amount of Pisan Romanesque architecture. In the 14th century Sardinia was awarded to Aragon. Much Catalan Gothic architecture goes back to the 14th–16th centuries, especially in churches and castles. The 17th and 18th centuries were stagnant artistically. Because of the remoteness of the island and the innate conservatism of the people, many purely local cultural elements have been retained from ancient times, especially in folk-art forms (textiles, costumes, jewelry, wood carving and inlay, basketry), which still survive (III, pl. 164; V, pls. 341, 342, 344; VI, pl. 277; VII, pl. 311).

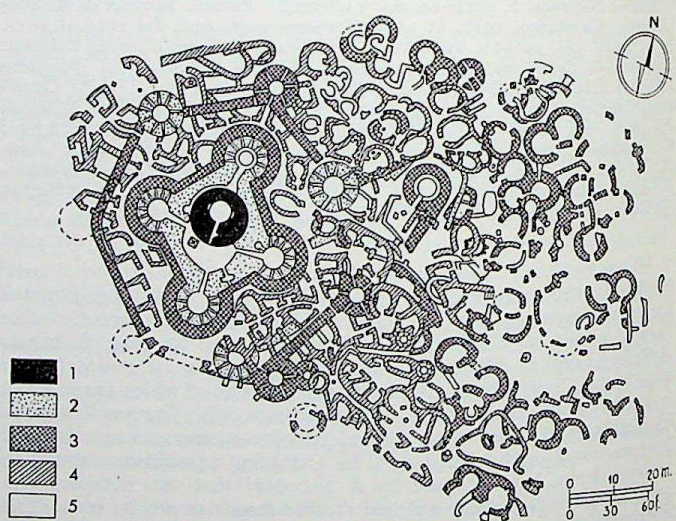
Alghero. Believed to have been founded in the early 12th century, the town was held by the Dorias of Genoa for about 150 years and was their chief stronghold. In 1354 it became a Catalan colony. Part of the 12th- and 13th-century Genoese fortifications, restored and enlarged by the Spanish, is still extant. There are sections of the city walls, with numerous towers, such as the 16th-century Torre dello Sperone. S. Francesco was built in the 14th century, enlarged in the 15th, and remodeled in the 18th. In the interior the choir retains the Gothic vaulted ceiling (restored). The Cathedral is preceded by a neoclassic pronaos. The richly decorated portal, the campanile, and the apse, with lateral chapels and a vaulted ceiling, are in Catalan Gothic 16th-century style. The Casa Doria (16th cent.) has a Renaissance portal and Catalan Gothic windows.

Six and a half miles north of Alghero is the aëneolithic Ánghelu Rúiu necropolis, with rock-cut tombs that have yielded important grave furnishings.

Bibliog. S. Rattu, Bastioni e torri di Alghero, Turin, 1951; D. Levi, La necropoli di Anghelu Ruju e la civiltà eneolitica della Sardegna, S. sardi X–XI, 1952, pp. 5–51.

Barúmini. In the Marmilla region, southeast of Oristano, this zone has about twenty nuraghi; the most important complex is that of Su Nuraxi, comprising a nuraghe and an adjoining nuraghic village (IX, pl. 401). The nuraghe consists of a central structure with a round tower, surrounded by four smaller towers connected



Barúmini, plan of the nuraghe and nuraghic village. *Key*: (1) structures of the archaic nuraghic period; (2) structures of nuraghic period Lower I; (3) structures of nuraghic period Upper I; (4) structures of nuraghic period II; (5) structures of the Punic-Roman period.

by walls enclosing a courtyard in which other fortifications are located. The construction is of several phases, from approximately the 12th to the second half of the 8th century B.C. The village also shows a range of building periods. Of interest are the circular huts of the 8th century B.C., laid out around an open circular area, with a larger communal hut.

Bibliog. G. Lilliu, Il nuraghe di Barúmini e la stratigrafia nuragica, S. sardi, XII–XIII, 1, 1952–54, pp. 90–469; G. Lilliu, Il nuraghe di Barúmini e la stratigrafia nuragica, Sassari, 1955; EAA, s.v.

Bithia (or Bitia). Near modern Chia, on the south coast, this was a city of Punic origin on a site of the nuraghe civilization, as evidenced by remains of a nuraghic village on the Punic acropolis. Some Punic structures were used again later by the Romans, who decorated them with paintings and stuccoes. In a Punic sanctuary was a statue of the god Bes and a depository of votive objects (terracotta figures, vases, Punic and Roman coins). On the beach is a necropolis with Punic and Roman tombs.

Cagliari (Lat., Carales, or Karales). Capital of Sardinia, the town is situated on a gulf on the south coast. Founded by Phoenicians, it became the leading Carthaginian city in Sardinia, then a prosperous Roman port. It was sacked by the Vandals in the 5th century and declined during the Byzantine period. In the 13th century the city came under the rule of the Pisans, who fortified it. In 1327 it passed to Aragon. After 1720, under the house of Savoy, it was the capital of the Kingdom of Sardinia. During World War II it was heavily damaged. In spite of its antiquity, the city now has a predominantly modern appearance. Of the Punic period are the remains of a sanctuary and two rock-cut necropolises. Remains from the Roman period include the baths (called "Casa di Tigellio"), with a mosaic floor; the tomb popularly called "Grotta delle Vipere"; and an elliptical amphitheater partly carved out of the rock. A necropolis (2d–5th cent.) excavated in 1950 contains both pagan and Christian tombs. The only Early Christian Church to have escaped destruction by the Vandals is SS. Cosma e Damiano (formerly S. Saturnino), which has been restored after bomb damage to the eastern bay in 1943. The original 5th-century building of massive ashlar masonry was rectangular, with a hemispheric dome resting on piers. The barrel-vaulted eastern bay, in Provençal style, was added between 1082 and 1119. Another bay on the western end is now an atrium, the vault having collapsed. Of the 13th-century Pisan fortifications, two battlemented limestone towers (Torre S. Pancrazio, 1305, and Torre dell'Elefante, 1307, both by Giovanni Capula) and a gate (Porta dei Leoni) remain. Rectangular in shape, the towers are open on the inner sides with wooden platforms connected by stairs. The Aragonese added other bastions, and the Bastione di St-Remy dates from the Savoyard period. Most of the fortifications were dismantled in the 19th century, and the modern city was built on the site of the bastions and ditches. The older part of the city, Castello, is situated on the hill of that name, where the few remaining old fortifications still stand. The Cathedral (S. Maria) was begun in the 13th century in Tuscan Romanesque style but was remodeled in baroque form in the 17th century. Fragments of the original façade were incorporated in a reconstruction of 1933, and the arms of the transepts retain some of the original structure. The three-aisled interior, in the form of a Latin cross, contains two pulpits fashioned from the dismantled great pulpit of Master Guglielmo (PL. 181) brought from the Cathedral of Pisa; a lectern attributed to Guido da Como (14th cent.); and the tomb of Martin of Aragon, King of Sicily (d. 1409). In the Museo Capitolare is a triptych by G. David (Triptych of Clement VII). The campanile is of the 13th century (restored). Of S. Domenico (founded, 1254; remodeled under the Aragonese; bombed, 1943) there remain only the lower courses of the walls and the Cappella del Rosario (1580), a Catalan Gothic construction with Renaissance influences. S. Francesco di Stampace (late 16th cent.) was destroyed by fire in 1872, and only a portion of the cloister remains. The bastions of the Aragonese castle have been transformed into a terrace with a large double-ramped stairway. A good example of Catalan Gothic architecture is the Purissima, a 16th-century church with a single aisle, lateral chapels with Gothic arches, and vaulted ceiling. In baroque style are S. Michele, with stuccoes by G. Altomonte; S. Anna (1785–1817), in Piedmontese baroque style; the "Cappellone del Sto Sepolcro"; the University (by G. Balgrano, 1765); the Tridentine seminary (18th cent.); and the Prefettura (18th cent.). The 18th-century glacis of the fortifications of the castle and harbor was turned into a public promenade in 1839. The neoclassic building of the Galleria Comunale d'Arte was designed by C. Boyl in 1828. It houses ethnographic and Oriental collections and paintings by Sardinian artists. The Museo Archeologico contains Sardinian archaeological material.

Cornus. At this site of a Punic colony on the west coast, there are remains from the nuraghe civilization, Punic graves, and Roman vestiges. On the acropolis, on the Corchina hill, late Roman remains have been found.

BIBLIOG. A. Taramelli, Ricerche ed esplorazioni nell'antica Cornus, NSc, 1918, pp. 285–331; G. Pesce, EAA, s.v. Cornus, II, 1959, pp. 860–61; G. Pesce, Sardegna punica, Cagliari, 1961, pp. 46–47.

Fordongianus (Lat., Forum Trajani). There are notable Roman remains, including a bridge and baths dedicated to the nymphs. Within the town there is a late 16th-century house with a portal and windows in Catalan Gothic style, with ogival arches. The parish church has part of the old structure in a similar style.

In the vicinity is S. Lussurio (Lussurgiu; 1100–20, restored), a Romanesque church with French influences, on the site of ancient catacombs. The south wall was built in 1250. The façade is Catalan Gothic of the 15th century.

BIBLIOG. A. Vicario, Uno sguardo all'architettura sarda sul principio del secolo XVII, BArte, XXX, 1936–37, pp. 178–87.

Iglesias. This small town grew up in the Middle Ages in the center of a mining region. In the 14th century the Pisan government fortified the town. Sections of the walls with battlemented towers and the castle of Salvaterra remain. S. Salvatore retains some traces of the original 10th- and 11th-century structure. The Cathedral (1285–88) has a transitional Romanesque-Gothic façade. The interior, with a single aisle, was remodeled in Catalan Gothic style. The Church of S. Chiara (1284–88) retains vestiges of earlier Franciscan Romanesque-Gothic structures, with traces of Islamic influence. S. Francesco, similar in style, was remodeled on Catalan Gothic lines in the 16th century. Nostra Signora di Valverde (Cappuccini), built in 1280–1300, has been restored. It retains the original façade in Pisan-Aragonese style.

Nora. An ancient city, its importance in the Punic period is attested by the remains of a sanctuary to Phoenician deities, dwellings, aqueducts, traces of fortifications, a necropolis where inhumation took place, and another where cremation was practiced. From a subsequent Roman city there remain a forum, a temple, vestiges of an amphitheater, a theater, and two baths.

BIBLIOG. G. Patroni, Nora: Colonia fenicia in Sardegna, MALinc, XIV, 1904, cols. 109–268; G. Pesce, Nora: Guida agli scavi, Bologna, 1957.

Olbia (Terranova Pausania until 1939). The name of this port would indicate that it may have been a Greek colony. Of the subsequent Punic city there remain traces of a temple and a necropolis. Olbia existed in Roman times but was destroyed, probably by the Vandals, in the 5th century. Rebuilt and renamed Phausania (or Pausania) in Byzantine times, in the 11th century it became an important commune under the Pisans, who renamed it Terranova. In the 14th century it passed to Aragon. The Church of S. Simplicio, in Pisan Romanesque style, is probably attributable to Tuscan builders who were influenced by the Lombard Romanesque. It was completed between 1100 and 1120 but was remodeled later. The interior contains traces of 14th-century frescoes. In the vicinity are nuraghic remains, in which were found the characteristic bronzes (IX, PL. 404) and other objects.

BIBLIOG. D. Levi, Le necropoli puniche di Olbia, S. sardi, IX, 1950, pp. 5–120; D. Panedda, Olbia nel periodo punico e romano (Forma Italiae, Sardinia), Rome, 1952; D. Panedda, L'agro di Olbia nel periodo preistorico, 1959; G. Pesce, Sardegna punica, Cagliari, 1961, pp. 48–49.

Oristano. Capital of the Giudicato of Arborea (one of the four medieval administrative districts of the island), Oristano was founded (ca. 1070) on a Roman site. In the 11th and 12th centuries it was a flourishing town. The Torre di S. Cristoforo, a survival of the 13th-century walls, is closed on three sides and open on the fourth, with open galleries, like those at Cagliari. The Cathedral was almost entirely rebuilt in 1773, but the apse and the lower part of the campanile date from 1288. The interior contains fragments of the 11th-century ambo and an *Annunciation* by Nino Pisano. Next to the sacristy is the so-called "Archivietto," built in a retardative Gothic-Renaissance style in 1626. S. Francesco was rebuilt in neoclassic style in 1838 by G. Cima but retains parts of the Franciscan Gothic façade, with Islamic elements, of 1250–80. In the Church and Convent of S. Chiara (14th cent.) there are remains of the original construction. The Antiquarium Arborense contains local art and artifacts.

In the environs: S. Salvatore is built over a subterranean Roman sanctuary and contains Roman wall paintings of the 4th century. Adjoining are the ruins of Tharros (see below). S. Giovanni in Sinis is of the 5th century, Byzantine in style, with a dome resting on piers. The interior (enlarged 11th cent.) has three aisles and a barrel-vaulted ceiling. S. Giusta (12th cent; PL. 178) has a Lombard façade and three-aisled interior, with reused ancient columns. The presbytery is raised above a large crypt, and the side aisles have ceilings vaulted with pointed arches. S. Maddalena (14th cent.) is in Romanesque-Gothic style.

Marco, NSc, 8th, ser., XII, 1958, pp. 409–12.

Porto Torres (Lat., Turris Libisonis). Probably of Punic origin, this became a prosperous port under the Romans. In the early Middle Ages it was abandoned on account of the perennial threat from pirates. In the 11th century the site was resettled and under Pisan rule again became an important center. The oldest remains are Roman, including a bridge with seven arches (1st cent.); a temple of Fortune, with adjoining basilica and tribunal (rebuilt 3d cent.); baths; an aqueduct (1st or 2d cent.); and a necropolis. There are remains of the medieval fortifications. S. Gavino (late 11th–early 12th cent.) was built in Pisan Romanesque style on the site of an ancient necropolis. Later it was enlarged by Lombard builders. The interior has a nave and two side aisles divided by columns with Roman and Early Christian capitals (5th cent.). The crypt contains several Roman sarcophagi.

Sant'Antioco (Lat., Sulcis). On a small island 3 miles from the southwest coast, the site was inhabited in the nuraghe period and was later a Phoenician colony. Under the Romans Sulcis was a municipium. It was destroyed by the Saracens in the early Middle Ages and rebuilt in the 11th century. There are remains of a Punic sanctuary and necropolis. The parish church (11th cent.) is built over a part of the necropolis, turned into a catacomb in the early Christian Era. There is a relatively well-preserved fresco (Early Christian) of the Good Shepherd in one of the chambers.

Pesce, Sardegna punica, Cagliari, 1961, pp. 43–44.

Santa Vittoria di Serri. On the basalt plateau, Giara di Serri, near the ruins of the medieval church of S. Vittoria is one of the most important cult centers of the nuraghe civilization. It is surrounded by megalithic fortifications and contains numerous edifices, all prior to the 5th century B.C. Among the most important is the temple built around a well (originally covered by a dome) within an elliptical wall. Another building is a hypaethral temple, on a rectangular plan, of megalithic construction. There was also an enclosure for feasts and markets, containing an inner enclosure associated with the symbol of the double ax, a kitchen, and a building believed to have been a foundry. One of the edifices contained a relief depicting a double amulet (Cagliari, Mus. Arch.). There are traces of dwelling huts, of which one was probably for the guardian of the sanctuary. Bronze statuettes (IX, PL. 403) and pottery have been recovered.

BIBLIOG. A. Taramelli, Il tempio nuragico . . . di Santa Vittoria di Serri, Rome, 1914; A. Taramelli and G. Patroni, Il tempio nuragico ed i monumenti primitivi di S. Vittoria di Serri, MALinc, XXIII, 1914, cols. 313–440.

Sassari. Founded in the Middle Ages, the town became the capital of the Giudicato of Torres. Between the 11th and 14th centuries it was contested between Pisa and Genoa, and in the 14th century it voluntarily placed itself under Aragon. Its present appearance is predominantly modern, although the older part retains the medieval plan, with narrow irregular streets. S. Michele di Plaiano retains some of the original structure of 1082. The Romanesque Cathedral (12th–13th cent.; partly remodeled, 15th cent.) retains some of the earlier structure in the side walls and the lower part of the campanile. The façade (18th cent.) is in Spanish colonial baroque style, and the interior in late-15th-century Catalan Gothic. A number of churches of the 13th century have in common certain characteristics due, perhaps, to Spanish builders, who combined the local Romanesque style with Islamic elements imported from Spain and, later, the Catalan Gothic influences characteristic of Aragonese territories. Among these are S. Donato (1278, remodeled later), S. Pietro di Silki, and S. Maria di Betlem (1250–80). The adjoining Convento di S. Maria di Betlem is in Catalan Gothic style (15th–16th cent.). Secular constructions include the Fonte Rosello (1606), a fountain in late Renaissance style; the Palazzo del Comune (18th cent.); the Palazzo della Provincia and the monument to Victor Emanuel II (both 19th cent.); and the Palazzo di Giustizia (1939). The medieval fortifications were dismantled in 1835, and the modern quarters of the city have spread beyond their ancient perimeter. The Museo Giovanni Antonio Sanna contains collections of archaeological and ethnographic material and a gallery of paintings.

Approximately 11 miles outside the city is perhaps the finest example of Pisan Romanesque architecture in Sardinia, the Abbey Church of SS. Trinità di Saccargia (founded, 1116; enlarged, 1180–1200). It is built of alternating strips of dark trachyte and white limestone. The façade has a small portico (1180–1200) and false galleries above. The single-aisled interior, in the form of a Latin cross, has 13th-century frescoes in the three apses. The campanile (ca. 1180) has two orders of double- and triple-arched windows.

Accascina, Gli affreschi di Santa Trinità di Saccargia, BArte, 4th ser., XXVIII, 1953, pp. 21–30.

Tharros. Ruins of a Phoenician-Punic foundation and a subsequent Roman municipium are found here. There are a large Punic necropolis and two temples; notable finds of jewelry were made here (X, PL. 410; XI, PL. 128). Of the Roman period are a *castellum aquae*, baths, and a drainage system.

Sicily (It., Sicilia). Sicily has partaken of cultural developments in the Mediterranean world from the earliest times. Figural rock art, evidence of Upper Paleolithic — and perhaps even Mesolithic — cultures, has been found in various parts of Sicily (near Palermo, the Egadi Islands). Neolithic, Copper, Bronze, and Iron Age cultures are represented in finds made throughout the island. The Greek colonization, which began in the second half of the 8th century B.C., brought the first notable flowering of culture, and important monuments remain from this period (see GREEK ART, WESTERN). A few traces of Phoenician and Carthaginian civilization are found in the western part of the island, an area that was subject to Carthage. Nor did the cultural significance of Sicily diminish under the sway of republican and imperial Rome, or later in the Byzantine epoch. Of the Arab domination (9th–11th cent.) there is little physical evidence, for almost every trace of this prosperous period has been destroyed or lost; however, documentary evidence is plentiful. In the Norman era (1072–1195) Sicily underwent remarkable architectural and artistic development, representing a distinctive fusion of Byzantine, Arabic, and Romanesque elements.

The Gothic art of Sicily is less ample than that of the mainland in this period. Predominant in the 14th century was the so-called "Chiaramonte style," a Norman Gothic variant characterized by extensive use of the zigzag motif; in the 15th century Catalan Gothic influences were strong. During the Spanish period (16th–17th cent.) late Gothic, Renaissance, and baroque architecture — the latter especially in Palermo, which was largely rebuilt under the Spanish viceroys in the early 17th century — flourished as elsewhere, with a particularly rich heritage of the baroque. Close relations with Italy (above all, Naples) under the Bourbons (1735–1860), as well as the reconstruction of many cities and towns after the catastrophic earthquake of 1693, are evidenced not only in the design of individual churches, palaces, and villas but also in the over-all plans of many cities. Baroque forms continue to be adapted in the minor arts and in folk art.

Acireale ('Ακίς; Lat., Aquilia). The origins of this town, perhaps on the site of the Greek Akis, are obscure. Remains of a Roman bath and of a temple from the republican period are at nearby Cape Molini, on the coast, and parts of another Roman edifice have been found in the Casalotto sector. Already devastated by an earthquake in 1169, the old town near the sea was permanently abandoned after an attack by the fleet of Robert II (d'Anjou) of Naples in 1326. The survivors built the present town, then called Aci, on a lava terrace overlooking the sea.

Again severely damaged by earthquake in 1693, the town was rebuilt in predominantly baroque style. The centrally located Piazza del Duomo is lined with baroque buildings: Church of SS. Pietro e Paolo (17th cent., restored), with statues of the titular saints on the façade; Palazzo Comunale (1659, much restored), with balconies supported by carved corbels; and the Cathedral (1597–1618), with 16th-century façade in Neo-Gothic style by G. B. F. Basile, incorporating a 17th-century marble portal between two bell towers. The Cathedral interior has frescoes by Pietro Vasta (1737) and Antonio Filocamo (1711). The 17th-century church of S. Sebastiano has an ornate façade (completed 1705), preceded by a balustrade surmounted by 10 statues of Old Testament figures. The dome, chapels, and transept are decorated with frescoes by Vasta. The Church of the Filippini and the Baths of S. Venera are neoclassic structures. The Palazzo Pennisi di Floristella, by Mariano Falcini (19th cent.), contains an important collection of Greco-Siculan coins of the 6th to 4th century B.C. The Pinacoteca dell'Accademia Zelantea contains coins, archaeological material, and paintings.

Adrano ('Αδρανόν; Lat., Hadranum; It., Adernò, until 1929). This town on the southwestern slopes of Etna, at the site of a Siculan temple dedicated to the indigenous god Adrano, was founded by Dionysius the Elder in 400 B.C. (sections of cyclopean walls with towers). Roman rule, under which the town declined steadily, is marked by portions of a bath and a necropolis on the outskirts. The Norman castle, rectangular in plan, was built by Count Roger in the 11th century. The Assunta (Chiesa Madre), originally a Norman structure, was enlarged and restored in 1640–56 and again in 1811. The former monastery of S. Lucia (1158), which achieved its present-day aspect in the 15th and 16th centuries, has an elliptical interior and a façade flanked by two bell towers. The Museo Petronio Russo conserves local archaeological material.

In the Mendolito district vestiges of a Siculan town have been uncovered and have yielded substantial artifacts, including the bronzes known as the "Mendolito hoard" (8th cent. B.C.; Syracuse, Mus. Archeol.).

Agrigento ('Ακραγας; Lat., Agrigentum; It., Girgenti, until 1927). Located about 2 miles inland, on the hilly site of prehistoric settlements, the Greek Akragas was founded in 582–580 B.C. by colonists from Gela. The city grew in size and wealth under Phalaris (570–555) and Theron (488–473), to such a degree that its splendor in the 2d half of the 5th century became proverbial. Destroyed by Carthage in 406 B.C., it was rebuilt by Timoleon in 340 and was conquered by the Romans in 210; under Roman rule it continued to flourish.

The early-5th-century city, below and south of the modern city, was arranged along Hippodamian lines. The circumference of the

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

walls, which had nine fortified gates and square towers, was 7½ miles; they enclosed the highest points of the modern city, as well as the summit of the easterly Rupe Atenea, perhaps the site of the acropolis. The agora adjoined the Temple of Olympian Zeus (Olympieion). A series of temples and sanctuaries, mostly of the mid-5th century B.C., were built along the eastern and southern sections of the city wall, on the edge of a natural rampart. Among these is the Temple of Demeter, over whose base rises the small Norman church of S. Biagio. Below, outside the walls, is a prehistoric sanctuary carved into the rock around a spring; this site of an indigenous cult, which has yielded considerable votive material, was adapted by the Greeks and later by the Romans. The so-called temples of Hera Lacinia and of Concordia and that of Herakles, along the southern rampart, are all Doric.

The Olympieion, begun after the victory of Himera in 480 B.C., was one of the largest of all Greek temples; some of its gigantic telamons have survived (VII, PL. 57). At the southwest corner of the ancient city is the sanctuary of the chthonian deities, with temples, sacella, and altars (7th–6th cent.), probably over a prehistoric site. The reconstructed fragment (1836) erroneously called the "Temple of Castor and Pollux" is actually a combination of elements from two temples — four Doric columns from one (5th cent.), the corner entablature from a Hellenistic construction. Beyond the western wall, across the Hypsas River, are the ruins of the so-called Temple of Hephaistos (actual dedication uncertain). Also beyond the walls, to the south, stands the Temple of Asklepios (5th cent.), a small structure *in antis*. Near the Church of S. Nicola excavations have revealed a large Hellenistic-Roman quarter (VII, PL. 236), with shops and dwellings, where excellent mosaics have been recovered. Other Hellenistic works are the small heroön known as the "Oratory of Phalaris" (1st cent. B.C.) and the commonly designated "Tomb of Theron," another funerary monument, probably of the Roman republican period. Along the south walls are Early Christian catacombs.

After the Arab conquest in 827, the city was renamed Gergent (Girgenti) and declined until it occupied only part of the western hill, but under the Normans it became the seat of a rich diocese. To this later medieval period belongs the Romanesque-Gothic church of S. Maria dei Greci, built over a 5th-century Doric temple from which six column bases can yet be seen. The church has a 13th-century Gothic portal. The Cathedral, built largely in the 13th–14th century and altered several times thereafter, has in part been restored to its 14th-century form. The interior has a nave and two side aisles, covered with both wood-beamed and coffered sections, and baroque stuccoes. Adjacent is an unfinished bell tower (15th cent.), which fuses Catalan Gothic with characteristic zigzag Arabo-Norman elements. This sawtooth decoration is also extensively used on the abbey church of Sto Spirito, built in 1290 (interior remodeled 18th cent.), which retains a Gothic portal and rose window on its façade; within are a trompe l'oeil ceiling and stuccoes attributed to Giacomo Serpotta. The cloister has several Gothic portals, the finest of which leads to the chapter house; both refectory and chapter house are roofed with Gothic vaults. The Church of S. Nicola is a single-aisled Cistercian Gothic structure of the 13th century, with remains of a monastery adjacent. The Church of the Purgatorio and the seminary are baroque. *Museums*: Museo Civico Archeologico; Galleria Sinatra (or di Arte Moderna); Antiquarium di Villa Aurea; Museo Diocesano.

Alcamo. Founded by the Arabs in the 9th century, Alcamo grew in importance under the Aragonese kings, during whose rule it was fortified with battlemented walls. It is dominated by a 14th-century castle, quadrangular in plan, with round and square towers at the corners. The Church of S. Tomaso (15th cent.), with Gothic portal and single-arched Gothic windows, is surmounted by small arches. The Church of S. Nicolò (16th cent.) has a round-arched portal and single-arched windows. From the baroque period are the Church of S. Francesco d'Assisi (ca. 1625); the Badia Nuova (or S. Francesco di Paola), built in 1699 by Giovanni B. Amico; the Badia Grande; and S. Oliva (ca. 1725), also by Amico. The Assunta (or Chiesa Matrice), of 14th-century origin, was entirely rebuilt in 1669.

BIBLIOG. P. M. Rocca, Di alcuni antichi edifici di Alcamo, Palermo, 1905; S. Monticciolo, La chiesa di S. Maria delle Grazie, Alcamo, 1942; V. Regina, Brevi note su Alcamo del '700, Alcamo, 1956.

Caltagirone. The site has been inhabited since prehistoric times (scattered necropolises, both in the city and in the surrounding countryside). In the early 11th century Caltagirone — the name is of Arab derivation — was conquered by the Ligurians, and in 1090 by the Normans. Devastated by the earthquake of 1693, the town gained its present appearance, marked by narrow and irregular squares, ramps, and stairways, in the baroque period. Few existing monuments antedate this disaster: part of the bell tower of the Church of S. Giorgio dei Genovesi (1030; rebuilt 1699), and of the left wall of the Church of S. Giacomo (1090; rebuilt 1694–1708); and the Corte Capitaniale, a single-storied edifice with alternate portals and windows, the work of Antonuzzo and Gian Domenico Gaggini (16th–17th cent.). Baroque 18th-century churches include the Rosario (Carlo Longobardi) and the Salvatore (Natale Bonaiuto). An imposing stairway known as the "Scala" rises from the Piazza Municipio to the Church of S. Maria del Monte (1143; rebuilt 1542 and after 1693). Another noteworthy building is the massive Monte di Pietà (1782), the former Bourbon prison, built by Bonaiuto.

Caltagirone has been famous since the Arab domination for its brilliantly colored majolica (III, PL. 157). The use of majolica for decoration of churches and secular buildings is characteristic. In the Villa, the vast public garden designed by Giovanni Basile (1846–48), is a collection of ceramics. *Museums*: Museo e Pinacoteca Civici Luigi Sturzo (Corte Capitaniale); Museo della Ceramica (Teatrino).

Catania (Κατάνη; Lat., Catina or Catana). The site, at the foot of Mount Etna, was inhabited in prehistoric times (early neolithic finds). The city was founded in 729 B.C. by Chalcidian Greeks from Naxos. In 477/476 B.C. it was conquered by Hieron I of Syracuse, who renamed it Etna; when in 461 the original inhabitants drove out the Syracusans, the city resumed its old name. After having been captured by Dionysius the Elder in 403 B.C., and again in 396, the city fell to Rome in 263 B.C. Greek remains include a Chalcidian necropolis, a theater and adjacent odeon, with Roman superstructures, and the acropolis, where many ceramics and terra-cotta figures have been recovered (late 7th–3d cent.). Of the Roman period are parts of the forum, the thermae on the site of the ancient monastery of S. Maria dell'Indirizzo, another bath (now Church of S. Maria della Rotonda), and parts of a large amphitheater.

The Byzantine epoch is recorded by a small basilica (5th–6th cent.) with remains of mosaics and the Cappella del Salvatorello (8th–9th cent.). From the Norman period, only a few portions of the Cathedral (begun 1092) remain. The Castello Ursino, built in 1239–50 (remodeled 16th cent., restored 1924), is square with round towers at the corners. The interior, centered around a court, preserves some rooms of the 13th century. Also of the 13th century is the Romanesque portal of the 18th-century church of Sto Carcere, originally on the Cathedral. The convent of S. Nicolò (begun 1558; 18th cent., remodeled in Spanish baroque style) is built around two porticoed courts. The convent church, built by Francesco Battaglia in the early 18th century, has an uncompleted façade; the interior is a three-aisled Latin cross. The Church of S. Maria di Gesù, rebuilt in 1706, retains the Paternò Chapel and sculpture by Antonello Gaggini from the original construction (15th–16th cent.).

The over-all baroque aspect dates from the reconstruction of the city after the great earthquake of 1693. Architect of this late baroque plan was Giovanni Battista Vaccarini, designer of much of the 18th-century construction, the most important being the rebuilding of the Cathedral (PL. 225). A three-aisled basilica, it followed a design by Girolamo Palazzotto that incorporated remains of the Norman structure. The façade, in the style of Borromini, and the balustraded prospect along the north wall were added by Vaccarini in 1736. The Museo di Castello Ursino has collections of archaeological material and medieval, Renaissance, baroque, and modern art.

State Museum Library • Lucknow •

Cefalù (Κεφαλοίδιον; Lat., Cephaloedium). A pre-Hellenic sanctuary (9th–8th cent.) known as the "Temple of Diana," including a sacred well and some megalithic walls, is situated above the town. In the 5th or 4th century B.C. a new construction of polygonal masonry in classic style was added. The first historical mention of Cefalù came in 396 B.C., when the city signed a treaty with Carthage. It was conquered by Dionysius I and then by Agathokles in 307; the Romans seized it in 254 B.C. The see of a bishop under Byzantine rule, it was subsequently taken from the Arabs in 1036 by Roger I.

The city is dominated by the Cathedral, begun in 1131; the façade (1240), by Giovanni Panettera, has two towers with three orders of single- and double-arched windows (PL. 173). The central section is surmounted by two orders of blind arcades, the lower one with interlacing arches, and is preceded by a triple-arched porch by Ambrogio da Como (1471). The single portal is richly ornamented. The triapsidal interior, with interlacing arches, is a three-aisled Latin cross, with transept and elevated presbytery. The central apse and the adjoining walls are decorated with mosaics (II, PL. 456), which are the work of Byzantine masters, perhaps with local assistants. The adjacent square cloister has paired columns and ogival arches (restored). Also from the Norman period are parts of the so-called "Osterio Magno," residence of Roger II. Museo Mandralisca: paintings, vases, and coins.

BIBLIOG. R. Salvo di Pietraganzilli, Cefalù: La sua origine ed i suoi monumenti, Palermo, 1888; P. Marconi, Il cosiddetto "Tempio di Diana," NSc, 1929, pp. 273–95; G. Centuripe (Κεντόριπα; Lat., Centuripae). The site was occupied by a Siculan settlement that remained independent until the mid-4th century B.C., when it came under Syracusan dominion. It flourished under the rule of Hieron II. Numerous necropolises in the vicinity have yielded rich Hellenistic material, in particular the highly regarded terra-cotta figures and the glazed pottery, painted and decorated with reliefs ("Centuripe ware"; III, PL. 138; VII, PL. 78). Portrait heads in marble (including one of Augustus; Syracuse, Mus. Archeol.) have been found in a Roman building of the imperial era; a Roman bath and a Hellenistic house have also come to light. The so-called "Castello di Corradino" is probably the ruin of a mausoleum from imperial times. In the 13th century the town was razed by Charles I of Anjou and was rebuilt in 1548 as the feud of the Moncada family. The Antiquarium is in the Palazzo Comunale.

Enna (Ἔννα; Lat., Castrum Hennae; It., Castrogiovanni, until 1927). Situated in an almost impregnable position, Henna was a Siculan stronghold (tombs of 8th–6th century at the nearby lake of Pergusa). Though Greek influence was felt as early as the 7th–6th century B.C., the city remained independent until 397, when it fell under the tyranny of Dionysius the Elder of Syracuse, and in 307 B.C. to Agathokles. For a while it was under Carthaginian rule and then passed to Rome in 258 B.C. In ancient times the region was the center of the cult of Demeter, and remains of a sanctuary have been found at the so-called "Rocca di Cerere."

Afterward an important Byzantine fortress, in 859 it fell to the Arabs, who called it Qaṣr Yani (whence the later Italian name) and fortified it. Conquered by the Normans in 1087, the city flourished anew under the Hohenstaufen and Aragonese kings, who were responsible for landmarks such as the octagonal tower of Frederick II (13th cent.) and the Castello di Lombardia, a two-storied octagonal structure that had twenty towers, of which the Torre Pisana is the best preserved of the remaining six. The Cathedral, built in the early 14th century and remodeled in the 16th, retains the transept and the three polygonal apses of the original. The churches of S. Francesco d'Assisi, S. Tommaso, and S. Giovanni all have Gothic bell towers. Part of the 15th-century Palazzo Pollicarini is in the Catalan Gothic style. Of the 16th century are the Church of the Carmine and the portico of S. Tommaso. S. Chiara was built in 1614; S. Benedetto is baroque. Museo Alessi: coins, jewelry, ceramics.

BIBLIOG. E. L. Falantano, Castrogiovanni, Palermo, 1907; EAA, s.v.

Erice (Ἔρυξ; Lat., Eryx; It., Monte San Giuliano, until 1934). Erice was settled by the Elymi. There are significant prehistoric remains in the region, which had a celebrated shrine to the goddess of fecundity, the Roman Venus Ericina, from which but a few fragments have survived. Vestiges of a Punic house exist below the castle, and parts of the city walls are Carthaginian work of the 5th century B.C. Devastated in 260 by the Carthaginians, in 247 B.C. it fell to the Romans, under whom it declined. Marking the Roman period, part of a bath and a well have been discovered.

The town regained prominence in the 12th century, after it was captured by the Normans, who called it Monte San Giuliano and built the castle (12th–13th cent.) on the site of the Temple of Venus Ericina, using salvaged material. They also strengthened the ancient walls. Erice has an over-all medieval aspect, although most of its churches were remodeled between the 17th and 19th centuries. The Chiesa Matrice (or Assunta; 1314) has a 15th-century Gothic porch; the interior, restored in Neo-Gothic style (1865), contains a *Madonna* attributed to Francesco Laurana. In front of the church stands a massive bell tower, originally built as a watchtower by Frederick II of Aragon in 1312. The Church of S. Giovanni Battista retains a 13th-century portal; within is sculpture by Antonino and Antonello Gaggini. The Museo Antonio Cordici holds archaeological material and a marble Annunciation group also by Antonello Gaggini (1525).

Gela (Γέλα; Lat., Gela; It., Terranova, until 1927). Gela is one of the most important archaeological sites in Sicily. Greek colonists from Rhodes and Crete, arrived about 688 B.C. Very prosperous by the late 7th and early 6th century B.C., Gela extended its rule toward the north and west; and about 580 B.C. colonists from Gela founded Akragas (Agrigentum). Under the tyrants Hippokrates and Gelon (early 5th cent. B.C.) the city gained large territories in southeastern Sicily. Even after Gelon became tyrant of Syracuse and transferred a large part of the population there, Gela flourished until 405 B.C., when Carthage destroyed it. Refounded in 339–338 by Timoleon, it was occupied by Agathocles (317–311) and completely destroyed by Phintias of Akragas in 282 B.C. The site was very likely abandoned until 1230, when Frederick II founded the fortified town of Terranova.

On the Molino a Vento height was the archaic Greek acropolis, with temples and subsidiary sacred edifices. Part of the stylobate of the oldest temple (6th cent. B.C.), dedicated to Athena, has been excavated and some of the fictile polychrome decorations recovered (mostly Syracuse, Mus. Archeol.). From another Doric temple, built after 480 B.C., only a single column and part of the foundation remain. The base of another temple, with fictile revetments, was recently discovered under the Molino Di Pietro, around which are signs of other small sacred buildings. Beneath the Nuovo Municipio was a temple dedicated to Hera, and smaller sanctuaries lay on the north slope of the hill. The rebuilt Gela of Timoleon extended farther west, as far as Cape Soprano, with a perceptible urban plan of regular orthogonal blocks. Excavations there have revealed a residential quarter of the 4th century B.C., including vestiges of a bath. Also at Cape Soprano is a stretch of the fortified walls that fully enclosed the ancient city for the first time under Timoleon (VII, PL. 55).

From medieval Terranova, which declined in importance and occupied only the western part of the hill, there remain the Porta Marina, with bulwarks of the Spanish period, and the former Church of S. Biagio (1391), with a small apse in Norman style. The Castelluccio, a 14th-century fortress, dominates the valley of the Gela from a ridge a few miles away. The neoclassic Cathedral (mid-18th cent.) has a façade with two superimposed orders of columns; the lower order may include salvaged ancient material. The Museo Nazionale contains archaeological material from Gela and environs.

Lentini (Λεοντῖνοι; Lat., Leontini). In the 9th and 8th centuries B.C. this was the site of an important Siculan town. Rock-cut tombs have yielded great quantities of pottery and figurines, as well as bronzes of the Finocchito type (750–600). In 730–29 B.C. Chalcidian Greeks from Naxos occupied the site. The settlement was devastated by the Syracusans in 424 B.C. and became subject to Dionysius I in 403 B.C. After a period of revival in the second half of the 4th century, in 214 B.C. it was conquered by the Romans and eventually declined.

There are vestiges of Siculan huts, rectangular in plan. Imposing sections of the archaic Greek walls stand to the south of the modern city; these were rebuilt several times (fortified gate with reentrant bastions). The so-called "archaeological zone" also contains traces of various sacred buildings and some necropolises (6th–2d cent.). In the area of the ancient city are found a number of Early Christian and Byzantine sanctuaries. On the Castellaccio hill, are the ruins of a Hohenstaufen fortress.

The modern town, adjoining the ancient on the north, was built after the earthquake of 1693, which destroyed the old city almost completely. The Chiesa Madre (S. Alfio), with three aisles divided by columns, incorporates a Christian hypogeum of the 3d century. It contains an icon (*Madonna Odigitria*; perhaps 9th cent.) and a Byzantine reliquary and parchments. The Church of the Martyrs (or della Fontana) has a holy-water stoup made from the capital of a column carved with images of the months (13th cent.). The local museum holds material from excavations in the region.

Lévanzo. On this island of the Egadi group, in the Cave of Cala Genovese (or dei Cervi), important samples of prehistoric art have been discovered (XI, PLS. 283, 287, 293).

Bibliog. P. Graziosi, Le pitture e i graffiti preistorici dell'isola di Lévanzo nell'arcipelago delle Egadi, RScPr, V, 1950, pp. 1–43; P. Graziosi, Palaeolithic Art, New York, 1960, passim; EAA, s.v.

Lipari (Λιπάρα; Lat., Lipara). Lipari offers a succession of archaeological evidence from the Neolithic through the Greek epoch. The oldest artifacts, found in the village of Castellaro Vecchio, are the incised and painted pottery of the Stentinello culture. Since the early Bronze Age the Castello of Lipari has been the site of the most important settlements. The inhabitants engaged in extensive Mediterranean trading; hence much Aegean pottery has been found on the island, together with local products. About the 15th century B.C. contacts between the Aeolian Islands and the Mycenaean world seem to have been close, as evidenced in certain round huts of this "Milazzese period" (named after a village discovered in the Milazzese locality on the neighboring island of Panarea). Next came the Ausonian culture (ca. 12th cent. B.C.), related to the Appenine cultures of the mainland. New forms of artifacts, quadrangular buildings, and cremation were introduced in this period (VII, PL. 314; IX, PL. 437). In 580 B.C. a colony of Cnidian Greeks once more established a flourishing civilization, lasting until 252 B.C., when the island was conquered by the Romans. Protohistoric and Greek strata retain the location of an acropolis. Also surviving are a tower from the Greek walls (4th–3d cent.), two Roman burial hypogea, and part of a bath, with mosaic pavement (2d cent.).

Inhabited largely by monks in the early Middle Ages, the island revived once more under the Normans and became the see of a bishop. Sections of the 13th- and 14th-century walls and towers still stand. Sacked by the Turks in 1544, Lipari was afterward rebuilt and repopulated, at which time the existing Spanish citadel was built on the site of the ancient acropolis. The present-day city developed at the foot of the Castello, outside the old walls, in the 18th century. The Cathedral, a Norman construction (1084), was almost entirely rebuilt in 1654 (façade added in 1861). The three-aisled interior is baroque. The Museo Eoliano, in the episcopal palace, contains material of the various island cultures.

Marsala (Λιλύβαιον; Lat., Lilybaeum). A Punic stronghold founded on Cape Boeo after the destruction of the Carthaginian Mozia (see below) in 397 B.C., Lilybaeum remained the chief Carthaginian bulwark in Sicily. Occupied by the Romans in 241 B.C., it became in turn an important commercial and military port, a municipium, and then a colonia, ultimately the chief administrative center in western Sicily. From the Roman period are 3d-century thermae with mosaic floors and a necropolis having aediculae painted with funerary banquet scenes (Palermo, Mus. Naz. Archeol.). Under the Arabs, who called it Marsa-Alì, the port flourished, and continued so under the Normans and Aragonese. In the 16th century it declined after Charles V obstructed the harbor against the Barbary pirates.

Dating from the medieval period are remnants of the bastions and a catacomb beneath the Church of S. Maria della Grotta, with Byzantine frescoes of saints (11th–12th cent.). S. Pietro, with a rose window on the façade, and the Church of the Carmine, with an octagonal campanile and triple-arched portico, are 16th-century constructions. The tower of the Convent of S. Pietro has two levels of triple-arched loggias. The present-day Porta Garibaldi is also a 16th-century work. The Cathedral, founded by the Normans (remodeled 18th cent.), has an unfinished baroque façade; the apse and dome, destroyed in 1943, have been restored. The interior furnishings include eight Flemish tapestries of the 16th century. The Church of the Purgatorio (1701) has an ornate baroque façade and interior stuccowork. The 18th-century Palazzo Comunale has a round-arched portico and a central tower and loggia above. The Porta Nuova is another 18th-century monument. The Museo Civico has an archaeological collection.

On the island of S. Pantaleo, north of Marsala, was the Phoenician city of Mozia (Μοτύη; Lat., Motya). Founded in the late 8th century B.C. on the site of a prehistoric settlement, it became an important commercial center and the chief Carthaginian defense against Greek expansion in western Sicily, until it was destroyed (397 B.C.) by the Syracusans under Dionysius I. Excavations have revealed part of the city, including walls with towers and gates, the rectangular Punic port, a sacred precinct, several houses, necropolises and a causeway that joined the isle to the mainland. The Whitaker Museum houses the finds from local excavations.

Mazara del Vallo (Mazaris, Mazare). Initially a Phoenician trading post, Mazaris became a commercial port for Selinous in the 6th and 5th centuries B.C. In 409 B.C. it fell to the Carthaginians, and to the Romans during the Second Punic War. Its good harbor, close to Africa, made it prosperous, even when Selinous was destroyed; and traces of ancient wharves and of Roman constructions have been found. Under the Normans the town was enclosed with a double wall; there are remains of a castle built by Roger I in 1071. The Cathedral (ca. 1075; rebuilt 1690–94) retains some of the original construction in the apse and transept walls. The façade, completed in 1906, has a portal relief of an equestrian Count Roger trampling a Moslem (1584). Within is a marble Transfiguration group by Antonello and Antonino Gaggini (1537), in the presbytery, and a ciborium signed by Antonello Gaggini (1532). The baroque bell tower was built in 1654–58. The Norman church of S. Nicolò Regale (12th cent.) has an inscribed-cross plan and three apses; the exterior walls have recessive blind arches pierced by single-arched windows. On the right wall of S. Caterina (1318; remodeled 17th cent.) is a Gothic portal in the Chiaramonte style from the original structure; the façade is baroque. Inside is a *St. Catherine* by Antonello Gaggini.

Structures belonging to the baroque period are S. Michele (1637) and the Jesuit College (1675–86), with a decorative portal and porticoed court. Also of the 17th century is the Palace of the Knights of Malta. The seminary and the episcopal palace are 18th-century edifices. The Church of S. Veneranda (1714) has an elaborate façade,

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

with a wrought-iron balcony over the portal. The Museo Civico (Palace of the Knights of Malta) has Roman material and paintings.

A little more than a mile outside the town is the 12th-century Basilian monastery of the Madonna dell'Alto (or S. Maria delle Giummare); its unusual roof consists of a series of parallel transverse barrel vaults resting on the exterior walls.

Megara Hyblaea (Μεγάρα Ὑβλαία). Near the modern town of Augusta a fortified neolithic village, with circular huts, has yielded incised pottery of the Stentinello type (IX, pl. 428). In the Bernardina sector, early Bronze Age pottery of the Castelluccio type has been found in a necropolis. In 728 B.C. Chalcidian Greeks founded a colony that lasted until 482 B.C., when Gelon destroyed it and moved the inhabitants to Syracuse. From the archaic Greek period are the foundations of three temples and subsidiary buildings, near which sculpture (VII, pl. 64) and painted terra-cotta architectural fragments have been found. Traces of the later walls of Agathokles and archaic and Hellenistic necropolises have also been uncovered.

On the Magnisi Peninsula (anc. Thapsos) are many rock-cut tombs with antechambers (ca. 1400–1250 B.C.) that have been the source of quantities of material, both local and imported Mycenaean.

Bibliog. P. Orsi, Megara Hyblaea, MALinc, XXVII, 1921, cols., 109–80; F. Villard and G. Vallet, Megara Hyblaea, Mél. Messina (Ζάγκλη, Μεσσάνα, Μεσσήνη; Lat., Messana). This site on the Strait of Messina was probably inhabited in pre-Greek times. It was colonized by Euboean Greeks, perhaps about 730 B.C. In 493 B.C. the city was taken over by fugitives from Samos and Miletos, and not long afterward became subject to Anaxilas, tyrant of Rhegion, who changed the name. As Messana, it flourished particularly in the 6th and 5th centuries B.C. Very few antiquities remain, and the present over-all aspect of the city is modern. Heavily damaged in World War II, the city has undergone large-scale reconstruction.

The Cathedral, begun early in the 12th century (consecrated 1197), was almost completely destroyed by earthquake and war in modern times and has been rebuilt in the Norman form. Original elements conserved include the lower part of the façade, with three Gothic portals (the central one by Pietro de Bontade, 1468); a 16th-century portal on the right wall by Polidoro da Caravaggio (once the commemorative arch of Charles V); some of the painted ceiling beams; vestiges of the apse mosaics (14th cent.), in Byzantine style; and the tomb of Archbishop De Tabiatis, by the Sienese Goro di Gregorio (1333). The bell tower, with a remarkable Strasbourg clock (1933), was designed by Francesco Valenti in this century from old prints of the original tower. The Annunziata dei Catalani, a Norman church of the second half of the 12th century rebuilt after the 1908 quake, shows Pisan influence. The Church of S. Francesco d'Assisi is a 20th-century reconstruction of the original Gothic edifice (1254); single-aisled, it is especially notable for its three battlemented polygonal apses. There are remains of the Gothic church of S. Maria Alemanna (early 13th cent.) and of the Cattolica, a church of the Greek rite antedating the Cathedral. The fountains of Orion (1547) and Neptune (1557), by G. Montorsoli, have been restored. The Spanish fortress of S. Salvatore (1546) guards the harbor entrance. The bronze statue of John of Austria (Piazzetta dei Catalani) is by Andrea Calamecca (1572). The Teatro Vittorio Emanuele was designed by Pietro Valente (1852); and the cemetery, surrounding the imposing Famedio, was laid out by Leone Savoia in 1872. Among the buildings erected after 1908 are the University, by Giuseppe Botto, and the Palazzo di Giustizia, by Marcello Piacentini. The Museo Nazionale contains archaeological material, medieval and modern paintings and sculpture, and baroque decorative arts.

About 2 miles west of the city are the picturesque ruins of the early-13th-century Benedictine monastery of S. Maria della Scala (or della Valle), known as the "Badiazza."

Bibliog. G. Buonfiglio, Messina città nobilissima descritta in XIII libri, Venice, 1606; L. Ozzola, Appunti sull'arte barocca a Messina, Vita d'arte, III, 1909, pp. 93–102; E. Geburstag, Stuttgart, 1960, pp. 230–40; F. Basile, La palazzata di Messina, Q. Ist. Storia Arch., 31–48, 1961, pp. 299–306; G. V. Gentili, EAA, s.v. Messina, IV, 1961, pp. 1084–86.

Milazzo (Μυλαί; Lat., Mylae). The promontory of Milazzo was the site of important protohistoric settlements between the 14th and 8th centuries B.C. (necropolises evidencing both inhumation and cremation practices). A colony of Greek Zankle (Messina) was established here in 716 B.C. The ancient city was on the high ground of the cape; the modern city lies below. The highest point is dominated by the castle built by Frederick II in the 13th century (incorporating older structures). It has an ogival doorway, set between two 15th-century towers, and a Gothic portal of the 14th century.

Bibliog. G. Agnello, Il castello svevo di Milazzo, RIASA, N.S., IV, 1955, pp. 209–41; L. Bernabò Brea and M. Cavalier, Civiltà preistoriche delle isole Eolie e del territorio di Milazzo, BPI, LXV, 1956, pp. 7–98; L. Bernabò Brea and M. Cavalier, Mylai, Catania, 1959.

Modica (Μότυκα; Lat., Motyce). Set within a hollow and resembling an amphitheater in layout, Modica presents a characteristic ancient city plan; but Greek and Roman evidence is negligible. Although the city was heavily damaged during the earthquake of 1693, it was rebuilt according to the early plan and its present-day appearance typifies the older Sicilian towns. In the chapel of the Casa De Leva is a 14th-century Gothic portal in the Chiaramonte style. The Church of the Carmine (15th cent.) retains a Gothic portal and a rose window on the façade. The Church of S. Maria di Betlem incorporates the late Gothic chapel of the Sacramento (15th–16th cent.). Linking the lower and the upper town is a grandiose stairway leading to the Church of S. Giorgio (18th cent.), probably designed by Vincenzo Sinatra; the imposing façade has an elaborate towerlike central segment of three tiers. The Church of S. Maria del Gesù (late 15th cent.) retains an ornate Catalan Gothic portal; the former convent of the Minori Osservanti, with a small cloister, is adjacent (ca. 1478).

Bibliog. E. Mauceri, La contea di Modica nell'arte, L'Arte, XVII, 1914, pp. 120–34; F. L. Belgiorno, Modica e le sue chiese dall'origine del cristianesimo ad oggi, Modica, 1955; L. Bernabò Brea, Sicily before the Greeks, London, 1957.

Monreale. The founding of the surrounding town was coincident with the building of the Cathedral, one of the masterpieces of Norman architecture (1174–89). The edifice is preceded by an 18th-century portico set between the two Norman towers. The upper part of the façade is ornamented with interlacing arches of limestone and lava in Arabic style, a motif that is elaborated on the exterior of the famed triple apse. The west portal has bronze doors with reliefs of Biblical scenes, the work of Bonannus of Pisa (III, pl. 12). The north wall displays another bronze door, by Barisanus of Trani (1179), reached through a portico designed by Gian Domenico and Fazio Gaggini (1547–69). The basilican interior (pl. 173) has three aisles, defined by salvaged ancient columns and capitals supporting pointed Arabic arches, and a square domeless presbytery in Byzantine style. The trussed ceiling, with wooden stalactites in Arabic style over the sanctuary, is a reconstruction (1811). The pavement of granite and porphyry disks, with interlaced marble strips, was part of the original conception (completed 16th cent.). The apse and side walls are covered with 12th- and 13th-century mosaics (II, pls. 286, 457; X, pl. 193), which are the work of local and Venetian mosaicists influenced by Byzantine masters. The Cathedral contains the sarcophagi of William I and William II (1575). The Chapel of S. Benedetto (1569) was faced with rich marble inlay and stuccoes by Giovan Battista Marino in 1728. Adjoining the Cathedral is the cloister of the Benedictine monastery (12th cent.), surrounded by a portico composed of pointed arches with double archivolts and string molding of Arabic type. The arches are supported by paired columns of varying forms (some plain, others decorated with mosaic) and imaginative figural capitals. In the southeastern corner is a columnar fountain resembling a palm trunk, enclosed by a small inner portico in Arabic style (pl. 426). The treasury holds reliquaries, sacred vestments, and other ritual objects. Fragments of the Norman royal palace are incorporated in the seminary behind the Cathedral.

On the summit of Mount Caputo are the ruins of the Castellaccio, a 12th-century fortified monastery of the Benedictines. The several baroque churches of Monreale include the Chiesa del Monte, with stuccoes of the school of Serpotta.

Morgantina (Μοργαντίνη, Μοργάντιον). The excavations at Serra Orlando, near Aidone, can very likely be identified with the Hellenized Siculan city of Morgantina. The site, which appears to have been inhabited from the Bronze Age, was colonized by Greeks in the early 6th century B.C. and seems to have flourished particularly during the 4th and 3d centuries B.C. The are remnants of the late-4th-century walls, and on the acropolis are vestiges of an indigenous protohistoric village, also marking the earliest Greek settlement, where archaic antefixes have been recovered. The rectangular Hellenistic agora, from the time of Agathokles (4th cent. B.C.), was on two levels, joined by an impressive trapezoidal stairway that probably served for the *ekklesiasterion* as well. A 2d-century Roman commercial center, with porticoed tabernae and macellum, utilized the same site. Behind the agora was a sanctuary of the chthonic deities, Demeter and Kore, the source of many terra-cotta votive objects.

Nicosia. Possibly occupying the site of the Siculan Herbita (Ἔρβιτα), Nicosia became important in the Middle Ages when populated by colonies of Lombards and Piedmontese under the Norman kings. Spread over the slopes of four rocky hills, with steep narrow streets and stairways, it is dominated by the ruins of a Norman castle. The Church of S. Maria Maggiore, erected in 1267 but rebuilt after the major landslide of 1757, has a baroque portal on its façade. From the original 14th-century structure of the Cathedral (S. Nicola), the façade, with an elaborately carved Gothic portal, and a small rose window have survived. On the left wall is a 15th-century portico with ogival arches. The massive Gothic bell tower (13th–14th cent.) has been restored. Churches dating from the 15th century are S. Michele and S. Benedetto. S. Vincenzo is decorated with frescoes by Willem Borremans (1777).

Bibliog. G. Paternò Castello, Nicosia, Sperlinga, Cerami, Troina, Adernò, Bergamo, 1907.

Noto (Νέητον; Lat., Neetum). There are two sites — Noto Antica, abandoned after the earthquake of 1693, and the new Noto built in the 18th century. The ancient town was Siculan (necropolises of the 9th–7th cent. B.C.); it later came under Syracusan domination; thereafter it became subject to Rome. Under the Arabs it was sufficiently important to lend its name to the Val di Noto, one of the three administrative districts of Sicily until 1817. From the medieval period there remain sections of the city walls, a square castle, and a fortified gate (Porta Reale).

The modern city, laid out on a series of terraces coursing the slopes of a hill, constitutes an excellent example of baroque urban planning, with spacious piazzas and stairways punctuating a rectilinear layout. The Cathedral (completed ca. 1770) has three façade portals, is flanked by two bell towers, and is approached by a broad, gentle staircase. The Palazzo Ducezio (1746; the present Municipio), designed by Vincenzo Sinatra, is surrounded with a classicizing portico. The Church of the Jesuit College (mid-18th cent.) is attributed to Rosario Gagliardi; S. Domenico and S. Chiara, with convex façades, are other 18th-century churches assigned to Gagliardi. The convent church of SS. Salvatore (1791–1801), by Antonio Mazza, has a neoclassic façade; the attached monastery dates from 1706. The former Dominican convent houses the communal museum.

In the region, also, are vestiges of a village (18th cent. B.C.), at Castelluccio, which has given its name to an important period of Sicilian protohistory. Here, ovenlike rock-cut tombs have yielded pottery, bronze, and bone burial goods (Syracuse, Mus. Archeol.). The Grotta dei Santi is a Byzantine troglodyte oratory, with traces of frescoes. Near Noto Marina are the remains of the Greek town of Heloros (wall and towers of the 5th century B.C., Hellenistic theater, and hypogeum). A columned structure, called "La Pizzuta," is probably a Hellenistic funerary heroön.

Palazzolo Acreide (Ἄκραι; Lat., Acrae). In a strategic position on the watershed between the Anapo and Tellaro rivers, atop the Serra Palazzia above the modern town, Syracusan Greeks established Akrai as a colony in 664 B.C. (Siculan necropolis, remnants of Greek walls). The town flourished particularly under Hieron II (3d cent. B.C.; small semicircular theater, bouleuterion). The so-called "Templi Ferali," quarrylike chambers (latomies) carved into the face of the rock, have votive or funerary niches and inscriptions recalling the names and deeds of the dead. The notable complex of funerary carvings known as the "Santoni" mark a sanctuary of the Hellenistic cult of Cybele (Magna Mater).

After having declined under the Romans, the town flourished again in Byzantine times and was destroyed, presumably by the Arabs, in the 9th century. The present town arose in the 12th century, as Placeolum. Partly destroyed by the earthquake of 1693, it was rebuilt in the 18th century; thus its appearance is predominantly baroque. The Palazzo Iudica houses a collection of antiquities.

Palermo (Πάνορμος; Lat., Panormus). A Carthaginian emporium, the city fell to the Romans in 254 B.C. It became a municipium and then a colony (20 B.C.). Excavations have brought to light sections of ancient walls, a vast Punic necropolis, and mosaics. Invaded by the barbarians and later subject to Byzantium (A.D. 535–831), Palermo fell to the Arabs in the 9th century and became the seat of an emir. Under the Arabs the city was particularly prosperous. In 1072 Palermo was conquered by the Normans. It was probably under Emperor Frederick II that Palermo achieved its greatest splendor.

One of the first Norman structures is the Church of S. Giovanni dei Lebbrosi (restored). If, as tradition would have it, the church was founded in 1072, it is the earliest; but scholars generally ascribe it to the early 12th century. S. Giovanni degli Eremiti (ca. 1132) incorporates parts of an Arabic building (probably a mosque). The church has five small red domes in Arabic style (I, PL. 413). The small cloister adjacent is of the 13th century. S. Maria dell'Ammiraglio (1143, restored), known as the "Martorana," has a campanile decorated with Arabic lava inlays. The central dome is supported by four columns and is decorated with Byzantine mosaics (II, PL. 458). The Palazzo Reale was originally an Arab fortress, which the Normans transformed into a fortified castle. Of the Norman building, there remain the 11th-century Torre Pisana and the chamber of Roger II, which is decorated with mosaics of secular subjects (PL. 426). The façade of the palace dates from the 16th–18th century. Incorporated in the palace is the Cappella Palatina (ca. 1130), which has a ceiling with Moorish stalactite vaults arranged in a honeycomb design (1143). The chapel preserves 12th-century Byzantine mosaics, as well as mosaics by local artists (PL. 173; II, PL. 457; IX, PL. 6). The pulpit, decorated with mosaics, and the sculptured paschal candlestick incorporate Byzantine and Moorish elements (PL. 173).

In Norman times an immense park extended southeast of the city. Palaces, kiosks, and fountains were erected there, for the most part by Arab artists in the service of William I and William II of Sicily. The palaces had high towers and usually included a large hall with exedrae and stucco and mosaic decoration. Among the edifices surviving are the Zisa (1154–60), which preserves a noteworthy mosaic frieze; the Cuba (1180); the Palazzo dell'Uscibene, probably of Arabic origin, with an adjacent Norman chapel; the Cuba Soprano, of which some arches survive; and the Cubula, a small kiosk surmounted by a red hemispherical dome. Moorish elements are also evident in the Castello della Favara, of which one wing and the chapel added by Roger II yet stand. The reigns of William I and William II (1154–89) were propitious for church building. S. Cataldo (ca. 1155), a three-aisled chapel, has three small domes. The Church of Sto Spirito (ca. 1178) has interlaced blind arcades on the exterior of the three apses. The north wall and transept are decorated with pointed arches. The Church of the Magione (SS. Trinità; 1150) preserves elements of the 12th-century cloister. The Cathedral (begun ca. 1170) was remodeled in the 14th–16th century and again from 1781, when the interior was redone and the dome by Ferdinando Fuga added. Only the two-aisled crypt and the apse date from the 12th century. The Cathedral preserves the royal tombs of the Normans and Hohenstaufens (12th–13th cent.).

The city declined under the Angevins but prospered again in the 14th century under the Aragonese. The Palazzo Chiaramonte

(known as Lo Steri; 1307) has a splendid pointed wooden ceiling, the work of Cecco di Naro, Dareno da Palermo, and Simone da Corleone. Exemplary also is the Palazzo Sclafani (1330). Noteworthy 14th-century churches include S. Agostino (interior remodeled 17th cent.) and S. Francesco d'Assisi, both with Gothic portals and rose windows. The Gothic style in Palermo absorbed Catalan influences in the 15th century. The La Grua-Talamanca Chapel (1429) in the Church of S. Maria di Gesù reflects this development. The work of Matteo Carnevale (Matteo de Carnilivari) marks the transition from the Catalan Gothic to Renaissance style in the architecture of Palermo. He built the Palazzo Aiutamicristo (1490) and the Palazzo Abbatelli (ca. 1495), which are characterized by depressed arches and porticoed inner courtyards. Also attributed to Carnevale is the Church of S. Maria della Catena.

Renaissance buildings of the 16th century retained some traditional elements. Renaissance churches include S. Maria di Porto Salvo, after a design by Antonello Gaggini; the square-plan S. Maria dei Miracoli (1547), attributed to Fazio Gaggini; S. Giorgio dei Genovesi (1579–91); S. Giovanni dei Napoletani (1526–1617); S. Francesco di Paola (1594); and S. Maria degli Angeli (or the Gancia), with the adjacent monastery. The Palazzo Santa Ninfa, the Porta Nuova (1534), the Porta Felice (begun 1582), and the fountain in Piazza Pretoria (PL. 225) are all late Renaissance works. The Norman church of S. Salvatore was remodeled in Renaissance style (1528). In the 16th century new streets were opened, such as Via Maqueda and the present Corso Vittorio Emanuele, which at their intersection form the Piazza Vigliena, whose four corners (the "Quattro Canti") are adorned with statues and fountains (G. Lasso, 1609–20). The baroque architecture of Palermo, both secular and ecclesiastical, is elaborately ornamented (e.g., Palazzo Ugo and Palazzo Villafranca). The interiors of the churches of the period were adorned with marble engravings and inlays. Such churches include S. Caterina (1566–96), the Olivella (1598), the Gesù (or Casa Professa, 1564–1636), S. Giuseppe dei Teatini (1612), S. Matteo (1633), S. Domenico (rebuilt 1636), and the Pietà (1689). The baroque church of S. Teresa (1686–1706) was designed by Giacomo Amato, who may also have been responsible for the Church of the Crociferi (17th–18th cent.). The Church of S. Anna (1606–32) has a fine baroque façade (18th cent.). The 18th-century oratories of the Rosario, S. Zita (1688–1718), and S. Lorenzo (1698–1710) are decorated with stuccoes by Giacomo Serpotta (II, PL. 169). Also 18th-century are the Villa Giulia (or Flora, 1777), the Botanical Gardens (1789), and the Parco della Favorita (1799). Interesting neoclassic architecture of the second half of the 18th century is represented by the work of Venanzio Marvuglia, who built the Oratory of S. Filippo Neri (1769), the Villa Belmonte (1806), and the "Palazzina Cinese" in the Parco della Favorita (V, PL. 200). *Museums*: Museo Nazionale Archeologico (Selinunte finds, prehistoric material, pottery, sculpture, Etruscan objects); Galleria Nazionale della Sicilia (art from the Middle Ages through the 18th century); Museo Diocesano (Palazzo Arcivescovile); Galleria d'Arte Moderna (works by southern Italian artists); Museo Etnografico Giuseppe Pitré (Sicilian folk art); Cathedral treasury.

Piazza Armerina. This town was founded in the 12th century, after William I destroyed the nearby rebel town of Platia. The Church of S. Giovanni di Rodi (13th cent., restored) has a Gothic portal. The 14th-century castle is a rectangular structure with square corner towers. The Church of the Carmine (15th cent.) retains the original campanile, with Catalan Gothic windows, and a small 16th-century cloister. S. Pietro (restored) was built in the early 17th century. The former church of S. Anna has a curved baroque façade; S. Ignazio (1603) preserves fine stucco decoration. S. Rocco (1613) is baroque, as is the Palazzo Trigona della Floresta, which houses a collection of paintings. The Cathedral (1627), designed on a Latin-cross plan by Orazio Torriani, has a baroque portal with twisted columns (1719). The lower part of the campanile has Catalan Gothic windows (1420). The Museo Civico is in a former convent.

Near Piazza Armerina was the city of Sofiana (anc. Philosophiana), which flourished in Roman and Byzantine times. There are remains of houses and a basilica, as well as other material. A short distance from these ruins is the large Roman villa at Casale, variously ascribed to the late 3d or early 4th century of our era or to the second half of the 4th century. The most notable feature of the villa is its late-antique mosaic pavements, one of the finest extant groups of ancient mosaics (X, PL. 178).

Ragusa. The city comprises two zones, Ragusa Superiore (largely modern, on a checkerboard plan) and Ragusa Ibla (narrow irregular streets). The latter area, the old city, was probably the site of the Siculan Hybla Heraea. A Greek necropolis (6th cent. B.C.) has been disclosed in the area. Almost totally destroyed by the earthquake of 1693 and rebuilt in the 18th century, the present appearance is generally baroque. The Cathedral (1706–60) has a wide baroque façade and a tall campanile at one side. The Basilica of S. Giorgio (1738–75) was designed by Rosario Gagliardi. The façade, preceded by an imposing staircase, has three orders of columns; the neoclassic dome was completed by Carmelo Cutrano in 1820. Nineteenth-century structures include the neoclassic church of the Collegio di Maria Addolorata (1801) and the Bridge of the Cappuccini (1820). The Antiquarium houses archaeological material.

Randazzo. The origins of Randazzo are remote; the city enjoyed its greatest prosperity under the Aragonese kings and thereafter declined. Built largely of black lava from Mount Etna, Randazzo preserves its medieval appearance in the narrow winding streets, parts of the city walls, houses with double-arched windows (divided with slim, often twisted columns), and doorways with pointed arches. A square tower of unplastered black lava is all that remains of the Aragonese castle. The Cathedral (S. Maria), built in the 13th century and subsequently remodeled, has three polygonal apses from the original structure and two lateral Catalan Gothic portals of the 15th century. The campanile on the façade dates from 1863. S. Nicolò (rebuilt 1585) retains a 13th-century transept, choir, and polygonal apse. The façade is of the 17th century and the campanile of the 18th. The church preserves a 14th-century baptismal font and sculpture and reliefs by Antonello and Giacomo Gaggini. S. Martino dates from the 13th–14th century but was subsequently remodeled; the façade was built in the 17th century, and the crenelated campanile is a 14th-century structure. The Palazzo Finocchiaro was built in 1509. The museum in the Palazzo Vagliasindi houses artifacts (5th–2d cent. B.C.) from the Greek necropolis at Sant'Anastasia.

Sant'Angelo Muxaro. This hilly site may be identified with the ancient fortress of Kamikos, which according to legend was built by Daidalos for the Sicanian king Kokalos. A Siculan necropolis, with large dome tombs (tholoi), has been excavated. Some of the goldwork found (evidencing Mycenaean influence) may date from the 2d millennium B.C., while most of the tomb furnishings date from the 8th–6th century B.C. Nearby are ruins of a medieval castle.

Sciacca. The town, noted for its hot springs, was known as Thermae Selinuntinae in Roman times. The city was given its present name by the Arabs, under whose domination Sciacca became an important city. It was fortified with walls three times, by Roger I, by Frederick II of Aragon, and by the Spanish viceroy De Vega (1550); sections of the last walls survive. The older parts of the town retain a medieval aspect. Romanesque structures include S. Nicolò (12th cent., restored), with a simple façade, blind arcading, and three apses; the Cathedral (12th cent., rebuilt 17th cent.), which preserves the three original semicircular apses and 16th-century sculpture by the Gagginis; and S. Maria delle Giummare (or Valverde; rebuilt 18th cent.), with a crenelated façade between two towers adorned with double-arched windows. A number of churches preserve Gothic portals, including S. Gerlando (14th cent.) and S. Margherita (1342). The latter has a 14th-century Gothic portal on the façade and a lateral portal by Domenico Gaggini (1468). The 14th-century Castello Luna is in ruins. The Steripinto, a 15th-century palace in Siculo-Catalan style, has a façade of rusticated ashlar. The Porta S. Salvatore (16th cent.), the chief gate of Sciacca, is adorned with plateresque carving.

BIBLIOG. G. Frosina Cannella, Di Sciacca e delle sue anticaglie, Il Buonarroti, XIII, 1879, pp. 3–14; I. Scaturro, Storia della città di Sciacca, 2 vols., Naples, 1924–26.

Segesta (Ἔγεστα, Αἴγεστα, Σέγεστα). Founded by the Elymi, on Mount Barbaro, Segesta was early Hellenized. During the Punic Wars it sided with the Romans. It was devastated by the Vandals and the Saracens in the Middle Ages. There are remains of fortifications from the 5th century B.C., including towers and gates. The famous temple of Segesta (second half of 5th cent. B.C.) stands alone west of the city. Thirty-six columns and the trabeation survive intact (VII, PL. 54). The Hellenistic theater is notable.

Selinunte (Σελινοῦς; Lat., Selinus). Founded in the 7th century B.C. by colonists from Megara Hyblaea, this city represented the westernmost Greek penetration in the direction of the territory of the Carthaginians and the Elymi. The Greek Selinous reached the acme of its power in the 6th–5th century B.C.. In 250 B.C. the Carthaginians destroyed the city. East of the city are three temples (VII, PL. 53): Temple E (dedicated to Hera; first quarter of 5th cent.), Doric peripteral hexastyle; Temple F (end of 6th cent.); and the great Temple G (mid-6th cent.), Doric octostyle, almost 370 feet long. On the acropolis are Temple A and Temple O, both Doric (480 B.C.); Temple C, Doric hexastyle (first half of 6th cent.), once decorated with large polychrome terra cottas; Temple D (6th cent.); and the small Temple B, of the Hellenistic period. Along the principal roads are remains of dwellings of the Hellenistic period. Walls and massive earthworks also survive, including the fortifications of Hermocrates, protected by a moat with a semicircular tower. The city proper was located to the north of the acropolis. Beyond the Modione River was the Sanctuary of Demeter Malophoros, originally a funerary divinity; remains include a rectangular enclosure and a temple with pronaos, cella, and adyton (preceded by two altars), but without columns. There is another enclosure with the small temple of Zeus Meilichios. Much of the material from Selinous is in the Museo Nazionale Archeologico in Palermo (VII, PLS. 58, 59, 68). Two inhumation necropolises excavated nearby have yielded proto-Corinthian and Corinthian artifacts. A cinerary necropolis, northwest of the sanctuary of Demeter Malophoros, has yielded pottery of the 5th century B.C..

Solunto (Σολοῦς; Lat., Solus, Soluntum). Although there was a Phoenician settlement in the area in the 8th century B.C., the city whose remains survive was built no earlier than the mid-4th century B.C. The site remained in Carthaginian hands until 254 B.C. Under Roman rule it became a *civitas decumana*. A portion of the walls remain, in addition to part of the city, disposed over a series of terraces on a regular plan of intersecting streets. The streets are paved with stone blocks and bricks. There are vestiges of an arcaded agora, a small Roman theater with an atrium but without peristyle, and numerous cisterns. The Antiquarium conserves local archaeological material.

Syracuse (Συρακούσαι; Lat., Siracusae; It., Siracusa). Situated on the island of Ortygia and on the mainland opposite the island, the city was founded in 734 B.C. by Corinthian colonists on the site of an earlier indigenous settlement. It became the most powerful city in the western Greek orbit, particularly after it came under the rule of Gelon in 485 B.C. The city enjoyed periods of immense prosperity and political power under Hieron I (478–466 B.C.), Dionysius the Elder (405–367 B.C.), Agathokles (316–289 B.C.), and Hieron II (ca. 275–215 B.C.). The conquest by the consul Marcus Claudius Marcellus (212 B.C.) marked the beginning of the city's decline. The city had expanded from the island of Ortygia (the site of the earliest settlement) to the mainland, and by the end of the 5th century B.C. the newer quarters of the city (Achradina, Neapolis, Tyche, and Epipolae) had been enclosed within the walls. On Ortygia is the Temple of Athena (Doric peripteral, hexastyle), built by Gelon after 480 B.C. and in the early Middle Ages adapted for a Christian church. The hexastyle Temple of Apollo (or Artemis), on Ortygia, is probably the oldest large Doric temple in Sicily (late 7th or early 6th cent. B.C.). In the Achradina quarter is the so-called "Roman Gymnasium," actually a theater of the 1st century of our era, with a quadriporticus and a small temple. In the Neapolis quarter is the Greek theater, which was built in the 5th century B.C., entirely rebuilt in the 3d century B.C., and again rebuilt by the Romans (VII, PL. 55). Also in the Neapolis quarter are the sanctuary of Apollo Temenites, the altar of Hieron II (almost 650 ft. long), and the penal stone quarries (or latomies). In the Epipolae quarter are the most important remains of the fortifications erected by Dionysius I, including the Euryelos castle with its towered keep and moats.

In the Middle Ages the city was limited to the island of Ortygia. A center of important Christian communities, it was an imperial seat during the Byzantine domination (A.D. 663–68). Notable among the catacombs are those of S. Lucia and S. Giovanni, with the adjacent crypt of S. Marziano (4th cent.). S. Giovanni, the first Cathedral, was rebuilt after the earthquake of 1693. S. Pietro (4th–5th cent.; remodeled 14th cent.) preserves fragments of its Byzantine frescoes. Little remains from the Byzantine, Arabic, and Norman periods. As noted above, in the 7th century the Temple of Athena was transformed into a Christian church, the present Cathedral. The cella of the Greek temple, pierced by arches, comprises the nave. The

baroque façade was built by Andrea Palma in 1728–54 and decorated with sculpture by Ignazio Marabitti (1757). Within are statues by Antonello Gaggini. The 11th-century church of S. Nicolò was built over the remains of a Roman piscina. S. Tommaso (1199) has a Gothic portal. S. Lucia (12th cent.) preserves its original apses, portal, and the lower part of the campanile; the rose window on the façade dates from the 14th century. The rest of the church is the result of 18th-century remodeling. Over the altar is the *Burial of St. Lucy* by Caravaggio (1609). Under the Hohenstaufen and Aragonese dynasties, there was notable building activity. The Castello Maniace (ca. 1239), built on a rectangular plan with cylindrical towers at the four corners, preserves a Gothic portal and a triple-arched window. Several palaces have façades adorned with Catalan Gothic windows; some also have Spanish-style courtyards with porticoes and exterior staircases. Notable among these palaces are the Bellomo (13th cent., restored), Montalto (1397), Lanza (15th cent.); and Gargallo (15th cent.) palaces. The Porta Marina (15th cent.) has a Catalan aedicula above the outer arch. After the major earthquake of 1693, the city was rebuilt with baroque structures, some having balconies with elaborate wrought-iron railings (e.g., the Palazzo Beneventano del Bosco). The Church of the Spirito Santo (1727) was designed by Pompeo Picherali; the huge church of the Collegio is a somewhat earlier structure (1635–87). Modern structures include the Fountain of Artemis by Moschetti and buildings by Francesco Fichera. *Museums*: The Museo Archeologico houses material from all of eastern Sicily; the Museo Nazionale di Palazzo Bellomo contains objects from the Byzantine period through the Renaissance; the Antiquarium di Castello Eurialo preserves artifacts found about the Euryelos Castle.

Taormina (Ταυρομένιον; Lat. Tauromenium). Occupied by the Siculi from the 8th century B.C., the city was conquered by Dionysius the Elder in 392 B.C. In 358 B.C. the Greek city was founded by refugees from nearby Naxos. Under the Romans the city was a *civitas foederata*. For aligning with Pompey, it was reduced to the status of a colonia by Octavian, who drove out the inhabitants and established a military garrison. Remains include sections of the walls; the base of a temple (perhaps dedicated to Apollo), part of which was later occupied by a Roman odeum; the so-called "Naumachia" of the 2d–3d century of our era; a temple that may have been dedicated to Serapis; a large theater probably built in the 3d century B.C. and rebuilt in Roman imperial times; and a Roman cistern known as the "Piscina Mirabilis."

In A.D. 902 the city was destroyed by the Arabs, who rebuilt it under the name of Almoezia. In 1079 it was captured by the Normans. The city began to decline in the 15th century. Of the Byzantine period is the so-called "Saracen necropolis" near the Church of S. Pietro. From the Arab period perhaps is a tower incorporated in the Palazzo Corvaia. To the 13th century belong the walls (with the Torre dell'Orologio and the Porta Capena), the castle, and the Cathedral (much remodeled later). Important structures were built in the period from the end of the 14th century to the middle of the 15th. These edifices are Gothic, with some elements of Spanish origin (e.g., portals with depressed arches). Structures of this period include the Badia Vecchia, the Palazzo dei Duchi di S. Stefano, the Palazzo Ciampoli, and the former church of S. Agostino. Sixteenth-century buildings include the Casa Floresta and the former church of S. Maria del Piliere. In the former monastery of S. Domenico is a 16th-century cloister with a 17th-century well. The baroque Palazzo del Comune (1704) was rebuilt after World War II. The Antiquarium preserves local archaeological finds.

Tindari (Τυνδαρίς; Lat. Tyndaris). The Greek city, founded by Dionysius the Elder in 396 B.C., passed to the Romans in 234 B.C. and was a colonia in the Augustan age. In the 1st century of our era a large part of the city disappeared into the sea after a landslide. There are remains of prehistoric necropolises, Greco-Roman walls, a Greek theater (3d–2d cent. B.C.) remodeled by the Romans for gladiatorial spectacles, the so-called "Basilica," and tabernae. Tindari was a diocese in the Early Christian period. There are remnants of Byzantine walls and fortifications. The city was destroyed by the Arabs. The Sanctuary of the Madonna, a modern edifice, preserves parts of a 16th-century structure. The Museo Civico, is the repository for material from local sites.

Trapani (Δρέπανον, Δρέπανα; Lat., Drepanum). Trapani is divided into two sectors: the older, with narrow twisting streets on the end of a peninsula; the modern, with broad streets on a checkerboard plan. An ancient Sicanian village, it became an important city in 260 B.C., when the Carthaginians expelled the population of Eryx and resettled some in Drepanon. It declined under the Romans. The greatest prosperity began under the Aragonese kings, who enlarged and walled the city. In the 14th, 15th, and 16th centuries Catalan Gothic architecture flourished. The Sanctuary of the Annunziata (1315–32; rebuilt 1760) preserves the original façade, with a Gothic portal and a rose window; the baroque campanile was erected in 1650. The sanctuary comprises several chapels. The rectangular Cappella dei Pescatori (Fishermen's Chapel; 15th cent.) has a Gothic arch and an octagonal frescoed dome. The rectangular Cappella dei Marinai (Mariners' Chapel; 16th cent.) has shell-shaped niches around the walls. The rectangular Chapel of the Madonna has a marble arch (decorated with reliefs by Antonello and Giacomo Gaggini; 1531–37), with a bronze gate by Giulio Musarra (1591). On the altar is a *Madonna and Child* attributed to Nino Pisano or his atelier (14th cent.). S. Domenico and S. Agostino, both 14th-century constructions, preserve their original rose windows; the latter church also has a Gothic portal. The 16th-century church of S. Maria del Gesù has a Gothic-Renaissance façade and a Gothic portal; within is a *Madonna of the Angels* in enameled terra cotta, by Andrea della Robbia. The Palazzo della Giudecca, formerly Casa Ciambra (16th cent.), has a tower of rusticated ashlar and Catalan Gothic windows. The Fountain of Saturn was built in the late 16th century. The baroque Cathedral (1635) has a portico (1740) on its façade. The Church of the Collegio has a baroque façade by Natale Masuccio (1636). The Palazzo del Municipio (1696) has a façade adorned with columns and balconies. The Convent of the Annunziata houses the Museo Pepoli, with archaeological material, sculpture, and paintings.

757

IVORY AND BONE CARVING. Because of their resistance to the elements and their workability, ivory and bone have been used in all civilizations for furnishings and utensils. But these very qualities have made them equally suitable as media for engraving and small statuettes (see SCULPTURE). The story of these works, the products of a highly specialized class of artisans — and at times presenting the most highly refined aspect of the art of a particular people — can be traced, in a fairly unitary view, across the boundaries of periods and cultures.

SUMMARY. Materials and techniques, with special reference to tribal art (col. 757). Objects of ivory and bone in the ancient world (col. 763). Ivory work in Byzantium and western Europe (col. 768). Ivory in the East (col. 772): *Islam; India; China and Japan.*

MATERIALS AND TECHNIQUES, WITH SPECIAL REFERENCE TO TRIBAL ART. Among the prehistoric remains found in caves in Europe and Asia are numerous objects made of ivory from the tusks of elephants and mammoths and of bone and horn from other animals. As early as Upper Paleolithic times, primitive man was trying his skill in techniques of carving these materials. The simplest examples represent human and animal figures scratched or incised on the surface of a previously scraped fragment of ivory or on a naturally flat piece of reindeer antler, but prehistoric man also knew how to make effective figures in relief and to model figurines in the round, both naturalistic and abstract, representing animals — probably connected in some way with hunting magic — and, more rarely, female figures (PL. 235; I, PL. 436; VII, PLS. 351, 352; see PREHISTORY). A few of the patterns seem to be completely nonobjective.

Figural carving was highly developed in Eastern agricultural societies, especially in Egypt. The two forms of ivory used — hippopotamus and elephant — have definite characteristics that make it fairly easy to distinguish between them. The tusks, or incisor teeth, of the elephant (which are the ivory of commerce) and those of its ancient cousin, the mammoth, have a pattern, easily visible in section or on any cut surface, of thin, curving lines arching outward from the center and intersecting at regular intervals, producing an effect that suggests the engine turning on the case of an old-fashioned gold watch. Also, the tusks of the elephant family, in growing, are built up layer by layer, in thin cones, and when the ivory is very old the component parts tend to separate into these conic sections; this tendency has been observed in the case of the ancient Egyptian carvings in elephant ivory on furniture from the royal tombs at Abydos.

In contrast, hippopotamus ivory does not have the pattern of crossing lines; its inner structure, seen under magnification, is very different. Moreover, it can be identified by certain characteristics which are peculiar to it and are connected with the form of the raw material. Hippopotamus ivory comes from the long, tusklike canines and lower incisors. The canine tooth of the hippopotamus is roughly triangular in section and has a marked curvature, the curve being far more extreme than that of any elephant tusk; this curving form is preserved in numerous ancient Egyptian carvings, notably in the so-called "magic knives"; made of longitudinal sections, these were engraved with figures of animals, real and mythical, for occult purposes. The incisor tooth of the hippopotamus is long and straight, round in section; a considerable portion is hollow, which does not leave much solid ivory for carving. Both canines and incisors are sharply beveled near the point by abrasion from contact with opposing teeth; they never have the rounded, tapering end seen in elephant and other tusks. When hippopotamus ivory is very old, as in objects recovered from ancient Egyptian tombs, it tends to develop longitudinal splits and occasional transverse cracks, so that it comes apart in long chunks or blocks; it does not disintegrate in cones as elephant ivory does.

Probably at first under Egyptian inspiration, the ancient Phoenicians developed an extensive ivory-carving industry, doubtless using ivory from the elephants of Syria and Asia Minor (until these finally became extinct), as well as African ivory imported through Egypt. Also, it would seem that ivory was already coming from India at the time of King Solomon (10th cent. B.C.). The Phoenicians, being a strongly commerce-minded people, worked extensively for export, sending their carved ivories into Palestine and Mesopotamia as well as to parts of the Mediterranean world as far away as Spain. Engrossed in mercantile endeavor, they seem to have had little appreciation of the intrinsic qualities of tone and texture that characterize ivory as a medium, and they painted, gilded, and even encrusted it, with glass, lapis lazuli, and other valued substances, until sometimes little of the original surface could be seen.

Both Phoenician and Cretan influences may have affected the style of the huge chryselephantine statues of the Olympian gods created by Phidias and other Greek masters of the 5th century B.C. In order to obtain ivory pieces of sufficient width for the giant faces the sculptors must have cut cylindrical sections from the central portion of a large elephant tusk; these were presumably sawed part way through, longitudinally, and then softened by soaking — perhaps in vinegar and almond oil — until they could be opened out flat. The pieces of worked ivory and beaten gold were probably fastened onto wooden cores, the ivory parts undoubtedly being further ornamented by staining or painting, just as the stone statues generally were in ancient Greece.

Egyptian, Phoenician, and Greek techniques of ivory carving must have ultimately reached Rome. Early ivories have been found in Etruscan tombs, but it has been suggested that these were probably importations — perhaps of Phoenician workmanship — rather than products of a local industry. Ivory was popular in Rome and was highly valued among the Romans: Pliny the Elder, writing in the 1st century of our era, reported that because of its scarcity, even the bones of elephants, cut into layers, were beginning to be used as a substitute; owing to the demand, an ample supply of ivory was by then "rarely obtained except from India" (*Naturalis historia*, viii, 4).

We also learn from Pliny that in his time the people of northern Europe were using the horns of aurochs for drinking — anticipating the later Norse drinking horns — and that the Romans had a fairly substantial industry devoted to the use of horn, applying it to many articles of luxury, sometimes dyeing it, sometimes painting it, sometimes engraving it (*ibid.*, xi, 45). Undoubtedly in this period antlers were still being carved by the German tribes.

With the coming of Christianity to the Roman world, ivory carvers turned to producing objects of worship, with Antioch and Alexandria as centers; Constantinople, which was founded in 330, soon took the lead in this field. Some of the ivory used in Constantinople was walrus ivory from northern Russia, brought south by viking traders. This kind of ivory was to be the type most used by the ivory carvers of northern and western Europe during the Middle Ages. It is readily differentiated from other types. The tusks, or canine teeth, of the walrus are much larger than hippopotamus tusks, often exceeding 2 ft. in length, and are generally oval in section. A newly taken tusk has a white outer layer, which gradually turns yellow with age and exposure; the fossil tusks that Alaskans call "beach ivory" are often beautifully mottled in shades of violet and brown. This outer layer, not very thick, is plain in section: it does not have the fine intersecting lines of elephant ivory. The inner core of the tusk consists of a secondary deposit of dentine, which fills the original pulp cavity as the tooth grows outward. This core substance, somewhat darker than the outside, looks as though it were composed of many small round crystals. When a thin section of a walrus tusk is examined against the light, the inner core is definitely translucent, in contrast to the outer section, which is opaque.

The Moslem countries of the Near East and North Africa acquired both the ivory-carving technique and walrus tusks from Byzantium long before the conquest of Constantinople by the Turks, and the art reached a high point of development, in Persia particularly. Elephant ivory was a great deal easier to come by, since it could be obtained either from central Africa or from India, but the Moslems valued the walrus ivory much more highly; they prized it especially for sword and

UP State Museum, Lucknow

dagger hilts because it was reputed to have magical properties capable of stanching the flow of blood and healing wounds. Similarly, its fancied power to reveal the presence of poison led to its wide use for ornamental spoons. In order to show that the substance they were using was indeed walrus ivory, the carvers would deliberately expose the core, either by carving down to it or by splitting the tusk in half and mounting the two pieces outside to outside so that the inner surface was the one that showed. The latter technique is particularly in evidence in the hilts of the Turkish yataghans.

Through the influence of Islamic culture and through trade with Persia, walrus ivory was brought into northern India, where again it was highly valued for its supposed magical and medical properties. But long before this there had been in India a tradition of working elephant ivory. The quality of this work gradually declined during the Moghul period, but it revived to some extent in the 19th century. Even in the period of decline, however, ivory was carved into plaques for the decoration of walls, doors, and other woodwork. Indian ivory workers usually soften the ivory first by wrapping it in wet cloths for several days; in much of the actual carving the use of the bowdrill, to create fine lacelike effects, is apparent. To avoid waste, they often split a tusk in half and use both pieces. Thus one finds modern figures of elephants, horses, and other animals which are convex on one side and concave on the other.

In modern times much Indian ivory work has been done on the lathe rather than by hand carving, and some of it is artificially colored. Hyderabad is especially noted for its dyed and colored ivories in red and green. Since the tusks of the Indian elephants are smaller and coarser in texture than those of the African ones, there has been extensive importation of tusks from East Africa. In general, the Indian ivory is softer, whiter, and more opaque than the African and shows the characteristic pattern of arching lines less clearly.

In Ceylon, ivory was used even more extensively than it was in India, and the carving of ivory was considered a high art. The Singhalese used ivory from the native elephant, whose tusks are exceedingly small but provide ivory of fine quality and good texture. They made Buddha images, usually painted, and detailed statuettes of rulers and other mortals, always in the form of standing figures, as well as ornamental door plaques and such objects of utility as fancy combs and knife handles. Ivory turning was less esteemed but was highly developed. Horn was employed for sword handles, circular boxes, and combs.

The Burmese ivory carvers in Moulmein developed a distinctive style. Taking whole tusks or sections of tusk from the native elephant, they first carved the outside with intricate patterns of birds, animals, and flowers, following a tradition evolved by the carvers of teak. Then they carved out of the interior one or more figures — generally Buddha images — in such a way as to make them clearly visible through the latticelike openings in the outer tracery of plant and animal forms. The same technique was used in the making of ivory knife hilts and sword scabbards.

In Africa there have been two principal centers of fine native ivory carving — the Ivory Coast region, formerly centering in Benin, and the Congo region. Elephant ivory was of course readily accessible in both these areas, but, particularly along the Congo River, hippopotamus tusks as well were carved. A sensitive feeling for the innate form of the tusks distinguishes the products of both these regions. The carvers often worked whole tusks with carving in low relief, projecting from a surface which, since the depth of the carving was kept uniform, maintained the original roundness and the graceful lengthwise curve of the tusk.

In Benin, during the 19th century and earlier, giant tusks up to 5 ft. long were worked in horizontal bands of geometric designs representing interwoven cords or endless knots; others were even more elaborately decorated with rows of royal figures in full regalia. These huge tusks were originally mounted on fine bronze bases in the form of idealized portrait heads, and set up on the royal altars in the city of Benin. Legend has it that they were anointed with blood, and surviving examples in European and American museums usually have an unpleasantly rough surface said to result from the removal of the crusting caused by such libations. The actual carving is often extremely detailed — the rendering of crowns, necklaces, weapons, and so forth being fairly minute — but it is apt to be rather crude; in some cases the crudeness contributes to an impression of strength. More refined work was often done by the Benin ivory craftsmen on smaller objects such as trinket boxes (PL. 250) and bracelets (see GUINEAN CULTURES).

In the region of Loango, along the lower Congo, entire tusks of small elephants were often decorated with processions of figures in low relief, advancing upward toward the point of the tusk in a gradual spiral; the larger hippopotamus teeth were similarly decorated. Higher up the river and along its tributaries, in the former Belgian Congo, much ivory carving was done (PL. 250), especially by the Mangbetu people. This tribe seems to have used great quantities of ivory, pressing it into service for every possible utilitarian and decorative purpose. Even in the fashioning of a rather plain handle for a knife or a ceremonial cleaver, the great skill of the Mangbetu workers is apparent. Their art is obviously the product of a long tradition; unfortunately it is not possible to study the development of the tradition because, as a consequence of the tribal custom requiring that upon the death of a king his residence and all his property be destroyed, there are no ancient examples. A sign by which many of the Mangbetu ivory carvings can be quickly recognized is the depiction of figures with strangely tall, narrow heads; this reflects the tribal custom of binding infants' heads in order to make them long and pointed, a shape regarded as a mark of beauty. Such heads often form the finials of handles, and they are seen on the ends of tusks made into trumpets.

Turning to Indonesia, we find that Java and Sumatra, particularly, had a high tradition of ivory carving. This found its chief expression in the carving of handles for the traditional dagger, the kris. The most typical of these handles represent old Hindu guardian deities, such as Garuḍa, or rakshasa (Skr., *rākṣasa*, ogre). Unlike the Balinese images of these beings, which are fairly naturalistic, the Javanese examples are conventionalized almost beyond recognition. This is a reflection of the dominance of Islam, with its abhorrence of the image. The tusks of elephants native to Sumatra supplied some of the ivory for the Indonesian carvings, but far more valued, and hence more often found in the finer knives, is dugong ivory, that is, ivory from the tusks of the sea cow (*Halicore dugong*). This ivory comes principally from the female sea cow, surprising as this may seem, in view of the general opinion (even in scientific circles) that only the male dugong has tusks and that those of the female are abortive or rudimentary. The female dugong outwardly does not appear to bear tusks, but inside the skull are huge ones, fully twice as long as those of the male, much larger in diameter, and almost entirely solid (whereas the tusk of the male has a deep basal cavity and prominent surface scoring, both of which reduce the amount of usable ivory). This conclusion is based on an examination of dugong skulls, male and female, in the American Museum of Natural History, New York, and a study of Indonesian knives in the Lau Collection in the University Museum, Philadelphia.

The shape of the tusk of the dugong determined the form of the handles of the *röntjongs* of Sumatra, and this odd form was continued even in the case of hilts made of other materials, such as gold, precious wood, and buffalo horn. Dugong ivory is used throughout this area, as far as the Philippines. The Indonesians also seem to have been pioneers in the use of another out-of-the-ordinary substance — "hornbill ivory." This is a dense, carvable substance found in the solid casque of the helmeted hornbill (*Rhinoplax vigil*), growing above the upper mandible. Structurally speaking, hornbill ivory is neither ivory nor horn nor bone, yet it has locally been called "ivory" (*gading* or more precisely *angang gading*) for many centuries. It is softer than real ivory and very different in coloring. The hornbill "ivory" proper, contained within the casque, is a soft creamy yellow, becoming somewhat reddish at the top and sides, where it comes into contact with a brittle outer sheathing of vivid red.

761

The latter is more like true horn, and has an amusing resemblance to a huge lacquered toenail. It is the core material that has generally been used for fine carvings; once a highly valued commodity in East Asia, it was carved into unusual and costly ornaments in Java and in China (PL. 248). The outer sheathing, which was even more greatly prized, was sometimes removed and worked separately, especially by the Chinese. On the island of Borneo the whole casque, together with the attached upper mandible of the beak, was often carved into huge earrings for important chieftains. Such earrings are still being made and worn among the Kelabits of Sarawak.

China's long history of ivory carving — perhaps the longest — includes the working of walrus ivory, in addition to elephant tusks and mammoth ivory from Siberia. In northern China, walrus ivory was used at least as early as the T'ang dynasty; it was not regarded as a mere substitute for elephant ivory but was a far more expensive material, since it was popularly supposed to guard against poison. During the Ch'ing dynasty ivory carvers in many cases used only the crystalline core, frequently dyeing it a deep green with verdigris; the dyed form was much in demand for jewelry in the Manchu court. Hippopotamus tusks were commonly worked in Canton, especially the sharply curved canines, which were ideally suited for arched ornaments such as the popular elephant bridges and the elaborate scenic bridges that became a Cantonese specialty.

Another substance that the Chinese used for fine carvings and valued as an antidote to poison was rhinoceros horn. This dark-brown material is not true horn but comes from the concretion of hairlike fibers on the nose of the Asiatic (and African) rhinoceros which is known as its horn. Sometimes entire horns, up to 3 ft. long, were made into ornaments, but usually the horns were cut into sections and carved into ornamental cups. These cups, whose costliness made them available only to the very wealthy, generally show the fine ends of the fibers on the bottom of the inside or on the underside of the base, and their thinner edges, usually translucent, often have a golden glow.

Another of the major ivory-carving cultures, from the point of view of quantity produced, is the Eskimo, especially that of the peoples inhabiting northwestern Siberia and northern Alaska. These Eskimos seem to have inherited the tradition from an earlier people who belonged to the Old Bering Sea culture (V, PLS. 1–4, 8, 9). The Eskimo worked mainly in walrus ivory, to a lesser extent in bone and antler, using these substances for all manner of things, from hunting implements, sled runners, and boat fittings to household implements, personal ornaments, and toys. In a region where the only wood available was occasional drift logs found along the beaches, and where metal was nonexistent, there was no choice but to use these readily accessible animal materials (see ESKIMO CULTURES).

Although made primarily for utility, the Eskimo carvings are often works of art, with shapes dictated by function and with simple decorations consisting sometimes of small embossed figures or nucleated circles (PL. 249), sometimes of engraved pictures. Originally the figures of men and animals or complete hunting scenes engraved on walrus tusks and pieces of bone, sometimes on reindeer antlers, were probably drawn as records of events or for hunting magic. Later such carving was executed primarily as decoration of objects the Eskimos had made, such as tubular boxes for tobacco and snuff, and needlecases. There are also examples of engravings that appear to have been made just for the pleasure of the making.

The Eskimo people of northeastern Canada and Greenland also have for many centuries used walrus ivory for making tools and utensils, but they never seem to have achieved the artistic skill of their cousins in Alaska. In a few centers on the Labrador coast the work has been encouraged by the Grenfell Mission, and there are a few places in Greenland where artists have been trained under Danish guidance in recent years. The work cannot be said to be especially artistic, and it does not seem to be spontaneous, most of the designs having been suggested by Europeans as appropriate for European trade. And even in Alaska the Eskimo is making ornaments for the tourist trade, using power tools to fashion objects in fresh walrus ivory and the beautifully mottled "beach ivory."

The Indians of the northwest coast of North America far surpassed the Eskimo in their fine carvings in walrus tusk, the large bones of deer, and whalebone (PL. 249). Whalebone is easily recognized by its coarse texture; it has in exaggerated form the small pores and surface checking characteristic of animal bones in general. The Indians also made some remarkable horn spoons for ceremonial use, steaming and shaping the huge light-colored horns of the mountain sheep to make the dipper portion and adding exquisitely carved handles made from the much smaller black horns of mountain goats. The totem-pole style of decoration on the handles makes these easy to identify. Many other Indians of North America used large bones (particularly bones from the bison) and the antlers of deer and elk to make all manner of tools and implements.

Other primitive northern peoples, both in Europe and in Asia, made extensive use of reindeer antlers, as well as of walrus and mammoth tusks, for carving. Sometimes, as in the case of the modern ivory work of the Yakut, the Chukchi, and the Koryak tribes of eastern Siberia, the carving was solely a means of artistic expression; more commonly it was a means of decorating useful objects. The Lapps of northeastern Europe have long been noted for their pipes, spoons, knife handles, and sheaths of reindeer antler, decorated with primitive yet effective engravings, often depicting the reindeer itself. The Lapps, the Dolgans (PL. 249) of the Yenisei region in Siberia, and other peoples who domesticated the reindeer had a ready supply of this material from their own herds.

In medieval times and later, European carvers had at their command, brought from the far north, narwhal tusks as well as walrus ivory. However, these long, straight, spiraling tusks, known as "unicorn horns," were so greatly prized in the whole state that they were rarely cut up for carving. Among the exceptions were beakers and reliquaries, which turned to account the hollowness of the tusk, and swords, scepters, and bishops' staves. An elaborate use of narwhal ivory was made in the construction of the Danish coronation chair (ca. 1665) in Rosenborg Castle, Copenhagen.

Among the less valued substances — in addition to bone, which was much used as a substitute for ivory in the making of knife handles, combs, and ornamental panels, often beautifully engraved — was staghorn: from the antlers were made hilts and handles, particularly for rustic hunting swords and domestic carving sets. Ornamental carvings of staghorn are still made in forested regions such as the Austrian Tirol.

The 16th century brought great changes in European ivory work, with the widespread use of the lathe for turning small columns and splinters of ivory to be employed in the decoration of furniture. In the 17th century came an extensive use of ivory for inlays, and there was much demand for thin-sawed ivory panels; these were etched or engraved and set into wood, often in combination with tortoise shell, a type of decoration generally called Boulle work (or buhlwork) after André Charles Boulle, the 17th-century French cabinetmaker who devised this method of inlaying.

In more recent times, with the development of power-driven machinery, European ivory workers have had the advantage of circular power saws, which cut the tusks very quickly and neatly and with minimum wastage of the valuable material, and of strong power lathes for shaping. But perhaps the greatest change came with the introduction by Sir Hubert von Herkomer — better known as painter and academician — of the power drill for fine carving. These tools and the new commercial methods have spread all over the world, replacing the old hand craftsmanship. Wherever this has happened — in Bombay and Colombo, in Hong Kong and the ports of Japan, and even, as has been said, in Alaska — a decline in the artistic quality of the products is all too apparent.

Finally, there is a type of ivory that came into extensive use rather late, though perhaps known in ancient times — the ivory from whales' teeth. The 3d-century Roman writer Solinus mentions the use of teeth of a marine animal in the making of sword hilts in Ireland (*Polyhistor*, XXXV), and this reference could be to the teeth of sperm whales. Ivory from whale and porpoise teeth had probably provided material for

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

small objects in England and Scandinavia for many centuries, but the greatest use of whales' teeth for carving came during the 19th century. English and American whalemen used to while away their time on the long and tedious voyages by scrimshawing, as it was called — carving and engraving whales' teeth, as well as occasional walrus tusks and, more rarely, a hippopotamus tusk picked up in an African port. Some of these untrained engravers proved to be natural artists of great ability, and much of this scrimshaw work ranks high as folk art. Whale ivory can easily be recognized by the short, stubby shape of the whale teeth, their broadly rounded ends, and their conical base cavities; in section, it can be identified by the thick outer layer of cement and the interior of dentine, both marked with fine concentric lines.

The British and American whalemen also carried sperm whales' teeth and walrus tusks to Hawaii and other South Sea Islands, including Fiji and New Zealand, using them in barter with the native peoples, who carved these materials into necklaces and other ornaments in accordance with their own traditions. In all these places the indigenes had probably been doing some ivory work in whale and porpoise teeth before the Europeans came — this was certainly true in Hawaii — but the scope of the work was vastly extended with the increase in raw material resulting from trade with the whalemen.

Schuyler Van Rensselaer CAMMANN

Clear analogies with ivory and bone carving are offered by the art of wood carving. But since wood is an extremely perishable material, our knowledge of the art of wood carving is limited in the case of many old civilizations. This makes it difficult to follow a particular historical filiation in any thoroughgoing way. Moreover, wood is available in a wide range of dimensions, so that it lends itself to sculpture of large as well as small proportions (see SCULPTURE).

A closer affinity with ivory and bone — both because of the way it is worked and because of the smallness of the objects produced — is presented by amber. The term covers various fossil resins. Amber was much used in preclassical times from the Neolithic period on, especially in the Baltic countries (finds have made been in Danish, Swedish, and English tombs). But it was traded to the Mediterranean region (finds in Egypt, Syria, Mycenae, Italy) and thus came to be extensively worked in Islamic countries and in the Near East.

OBJECTS OF IVORY AND BONE IN THE ANCIENT WORLD. In Egypt a large number of objects of practical and personal use, in both ivory and bone, have been found in the predynastic tombs — among them arrowheads, hooks, fishhooks, bodkins, spoons, pins, combs, bracelets, necklaces. The first crude female figures in ivory appear in the Aëneolithic period, represented by the Badari finds. Ivory combs with handles ending in stylized zoomorphic figures — gazelles, giraffes, ostriches, and waterfowl — are characteristic of the predynastic era. At the end of this period, the handles show these motifs finely incised in three or four registers on both faces. The scenes are well differentiated and begin to acquire greater fluency. New animals make their appearance, depicted with a lively naturalistic feeling: the elephant, the lion, the antelope, the hyena, the wild boar, the snake. Finally, on the handles of ivory knives of late predynastic times, the ornamental passes over into the historical and descriptive with the appearance of human beings in scenes of war and the chase. A typical example is the knife handle from Gebel el Arak in the Louvre (IV, PL. 321), one side of which shows a desert hunting scene, with the hero subduing two lions (a motif of Mesopotamian origin), the other, warriors fighting in single combat, and a naval battle. A number of ivory plaques used as labels for jars of balsamic oil placed in the tombs of kings of the 1st dynasty have incised on them summary depictions — to us not always clear — of notable events.

Ivory was much used as decoration for the funerary furniture of the 1st–3d dynasties (ca. 2850–2600). Ivory supports (in the form of bull's legs) for beds and gaming tables found in the royal cenotaphs of Abydos reveal a particularly refined technique and an attentive observation of anatomy. Playing pieces were often of ivory, too, generally in the form of resting lions, in accordance with a canon that lasted until the end of the Pharaonic period. There are statuettes of sovereigns carved in ivory, but these are exceptional. In an archaic example (1st dynasty) from Abydos in the British Museum the king is dressed in an ample fringed mantle, his hands are crossed on his breast, and he wears the crown of Upper Egypt (IV, PL. 326). A second example, marked by highly individualized features, represents Cheops (Khufu; 4th dynasty) seated on a cube-shaped throne (Cairo, Egyptian Mus.); this, although carved with much refinement, is not far removed in style from similar works in stone. The production of ivory statuettes of nude female figures continued into the Middle Kingdom, a period which also produced ivories bearing finely incised decorations of subjects having magical significance. Four ivory statuettes of dancing pygmies, which were made to move by a system of strings, are felicitous expressions of the grotesque (Cairo, Egyptian Mus., and Met. Mus., New York; PL. 236). The greater part of the ivory and bone objects of the New Kingdom and the Late Period were made for the dressing table and for related uses (PL. 236).

Sergio BOSTICCO

The ivories of the ancient Near East that have come down to us can be divided, chronologically and stylistically, into two main groups: the first, belonging to the latter part of the 2d millennium B.C., reveals a connection with the Mycenaean world; the second, from the early centuries of the succeeding millennium, shows greater homogeneity and can be ascribed, despite the different origins of the various motifs, to a well-defined school, clearly Phoenician.

The ivories of the 2d millennium, the most notable examples of which come from Megiddo, Ugarit, Minet el Beida, Byblos, and Alalakh, faithfully reflect the complex culture (and not only in its artistic aspect) of the eastern Mediterranean on the eve of the invasion of the Peoples of the Sea: Mycenaeans and Phoenicians elaborated on Egyptian models, but reciprocal and overlapping influences are so strong that it is not always possible to establish whether a particular work should be assigned to the one or to the other. A case in point is the magnificent piece found at Minet el Beida depicting the *Potnia Theron*, in which Cretan-Mycenaean influence is apparent in both style and subject (PL. 237). It is also clear that the inspiration of many motifs is Asian — for example, animals in combat and the griffin — or Egyptian — for example, the Sphinx. On the other hand, Hittite influence, chiefly noticeable in a few Syrian works, seems relatively slight. If a large plaque from Megiddo showing a number of divinities, monsters, and men, which has been regarded as unquestionably a Hittite work, is correctly attributed, then it must be admitted that Egyptian influence made its way as far as Anatolia, for this piece has Egyptian motifs. The ivories from Megiddo are particularly important: some of the examples depict rather complicated scenes — triumphs, banquets, chariot battles — rendered in a style that can be described as local, or Syrian, and this in turn makes it possible to speak of a Phoenician contribution to the art of this period, hitherto thought to have been inspired entirely by Mycenae.

The ivories of the 1st millennium (PL. 237; I, PL. 526) differ from those of the preceding period: with the decrease in Mycenaean influence, the Egyptian is felt more strongly, although confined to motifs such as sphinxes confronted by Horus as a boy and variations on the palmette. However, there is no lack — indeed there is a preponderance — of new motifs of Near Eastern origin such as the woman at the window, the lion hunt, musical scenes, and in general female figures. In the study of such ivories a historical fact must be borne in mind: the powerful Assyrian empire, in particular the Assyrian court, had become the best client of the Phoenician artisans, many of whom went to Assyria to work. Ivories originating in Syrian cities (Samaria, Damascus; actually the Damascene examples were found at Arslan Tash, where the Assyrian king Adadnirari III had taken them) are mostly of mediocre quality, while those

UP State Museum, Lucknow

765

originating in Assyrian cities (Khorsabad, Nimrud) are in many cases real masterpieces. Particularly noteworthy are some examples found at Nimrud: A plaque of gilded ivory depicts a youth, seized in the jaws of a leopard, against a background of stylized flowers. In an example found in 1957 a young stag is shown, a motif which had not until then been seen in the art of western Asia. Naturally, not all the Assyrian ivories are on the same artistic plane. Nevertheless they are on the average definitely superior to those found in Syria. That we are dealing here with Phoenician and not native Assyrian artists is clear, for the ivory works of native Assyrian artists do not depart from the cold and stately style of the bas-reliefs of the royal palaces. We can therefore conclude that in this period too the best works — indeed the only great school in the field of ivory work — can be traced to Syria and credited to the Phoenicians.

Giovanni GARBINI

Ivory carving spread from the Near East through the Mediterranean world (see MEDITERRANEAN PROTOHISTORY; CRETAN-MYCENAEAN ART). Crete has bequeathed to us, from prehistoric times on, remarkable ivory objects, among them a cylindrical seal with scorpions on one side and on the other a composition of spirals. From the palace at Knossos comes the statuette known as the *Acrobat* (IV, PL. 64), a figure famous for the agility of his jump, apparently over the bull — a theme also treated in frescoes in the palace. The physical structure is handled with minute care, even to details like the veins; the hair is encrusted with gold. In Palaikastro were found ivory figures of nude boys, magnificently rendered in the tenderness of their age, their gold loincloths tied at the side, evidently with cords, the loops for which can be seen. This combination of ivory and gold is found frequently in antiquity, among all peoples. On the social plane, it answered to the requirements of a wealthy ruling class of taste and refinement; on the esthetic plane, it satisfied the predilection for strongly contrasting monochrome tones.

But more ivories of this age have been found in tombs on the mainland — at Mycenae, Sparta, and Menidi — than in Crete, and for this reason they may more properly be classed as Mycenaean. At the same time it must be noted that it is a question whether these ivories do in fact belong to the Cretan-Mycenaean civilization. They reveal a strong Near Eastern influence and in some cases, for instance, the small helmeted male head from Mycenae (PL. 237), we are doubtless dealing with Syro-Phoenician works (see above). For the most part the ivories are utilitarian objects; typical is a small box with hunting scenes dating from the 12th–11th century B.C. These Mycenaean figured ivories are closely related to objects found on the island of Cyprus, especially at Enkomi (see CYPRIOTE ART, ANCIENT), among them a cup on which is depicted a reclining calf, and a mirror handle showing a man fighting against a winged beast. Indications of Aegean influence are not lacking in ivories of Samaria and Nimrud, such as the superb plaque with a cow suckling a calf, in the Louvre (I, PL. 526). A second group of ivories from Nimrud show, in turn, Cypriote influence. The numerous references in the *Iliad* and, more especially, in the *Odyssey* lend credence to the belief that the use of ivory was widespread in the Homeric age. The house of Menelaos at Sparta, we are told, had walls covered with gold, silver, electrum, bronze, and ivory; of the "gates of dreams" (*Odyssey*, xix, 563), one was of ivory and one of horn — which suggests a Near Eastern environment, a view supported by recent excavations.

The great tradition of Mediterranean ivories was continued in Greece in the archaic period (see ARCHAIC ART; I, PL. 341). In Athens there have come to light many statuettes, one a female figure, from the Geometric period (1000–750 B.C.) which already reveal the essential characteristics of Greek archaic art. Of the utmost importance was the discovery of two tiny sphinxes in a temple near Perachora. Daedalic works of the first quarter of the 6th century B.C., these are executed with extraordinary vigor and at the same time great delicacy. The Greek colonies on the coast of Asia Minor were prolific, and the production was of high quality. The sanctuary of Artemis at Ephesos is the place of origin of two statuettes, one of a female priestess, the other of a chief priest (and eunuch; *Megabyzos*) — Ionic works of the 8th–7th century B.C. showing Near Eastern influence. In continental Greece many ivories of the same period were found in the ruins of the sanctuary of Artemis Orthia in Sparta, where they had been left as votive offerings; outstanding among them are a group of seated women and a man with long hair, from the 7th century B.C. The sanctuary of Apollo in Delphi is also rich in ivories; the hero subduing a lion (PL. 238) is one example. At this point there intervenes in all Greece a hiatus in the finds extending practically to the Hellenistic period, but to draw conclusions from this would be unwarranted. The Hellenistic ivories begin with a bust of Seilenos found at Sidon, which reveals great skill as well as great sensitivity. A little later in date is a statuette of extraordinarily fine workmanship representing a pygmy (PL. 239). Two statuettes of Athena fighting a giant, found in Paestum and belonging to the 2d century, are works of a certain amount of taste but of a decidedly regional character. A telamon in the Museo Nazionale, Naples, comes from Pompeii. A statuette of an actor from Rieti, in the Petit Palais, Paris, is striking for its polychromy. A fine statuette of Harpocrates from Szombathely in Hungary dates from Roman imperial times but in style is Syro-Hellenistic of the 2d century.

Among the ivory objects famous in ancient times but now lost is the Chest of Kypselos (tyrant of Corinth, 6th cent.), which was of cedar with inlaid decoration of ivory and bone, a technique which is found in the above-mentioned sphinxes of Perachora. It follows from this that even furniture was often inlaid with ivory. Practically speaking, there is no object for either use or ornament in which ivory cannot play a part. Particular interest attaches to chryselephantine work, which is well documented by the discoveries at Olympia and Delphi. However, not a single fragment has come down to us of the famous works of Phidias employing this technique, in the making of which he availed himself of the aid of Kolotes, whom we know to have been his collaborator in the creation of the *Zeus* of Olympia. The other widely renowned work of Phidias (q.v.) was the *Athena Parthenos* on the Acropolis of Athens. And we know that Skopas (q.v.) made an ivory statue, the famous *Hera* of Argos.

The taste for chryselephantine work merits a brief digression. The forerunners of this style were not so much the Cretan boys of Palaikastro as that kind of Assyrian work of which an example remains in the gold relief from Arslan Tash with incrustations of ebony. Ivory in ancient times was generally painted, following the practice that was customary for sculpture. In the great statues of Phidias, however, it is believed — though it must be granted that the sources are silent on this point — that the ivory parts were not painted. It is certain that combining gold and ivory as was done in the age of Phidias expressed a deeply-rooted chromatic sense responsive to pure and vivid color unmodified by chiaroscuro. The same taste is evident in vase painting and hence may be presumed in wall painting, which was innocent of *sfumatura* or any gradation of tones. Of large ivory sculpture there remain only a head and hand in Rome (Vat. Mus.) and a hand in the Cabinet de Médailles, Paris. Literary sources inform us that ivory was used for decorations in the interior of houses and also in decorating ceremonial vessels such, for example, as those which belonged to the Hellenistic king Ptolemy IV Philopator (Athenaeus, v, 541) and to the Syracusan tyrant Hieron II. The leaves of the door of the Temple of Athena in Syracuse were made of ivory, and according to Cicero, Verres had destroyed a very fine head of Medusa entwined with serpents which ornamented this door (*Verrine Orations*, iv, 124).

Etruria was as much subject to foreign influence in the art of ivory carving as in the other arts. Ivories of a more or less Oriental type were frequently imported in the 7th century B.C. (see ORIENTALIZING STYLE); those done locally were in the Syrian style. Of prime importance are ivories of the 6th century such as the decorative furniture and casket panels of Ionic-Etruscan style, the finest of which are perhaps those of Orvieto (PL. 238) and of Tarquinia. The little calf-bearer relief of Ionic style from the neighborhood of Perugia (PL. 238) should also be mentioned.

As was pointed out earlier, ivory was well known and widely used in Rome. It decorated the richest furniture and must have been very expensive at least until the beginning of the

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Empire, for Horace speaks of it as a luxury in which he takes pride in not indulging himself. According to Propertius (ii, 31), the Temple of Apollo erected on the Palatine by Augustus had doors of ivory depicting the flight of the Celts from Delphi and the slaughter of the children of Niobe. Bone was also very widely used in Rome, particularly for small objects such as dolls, dice, pyxides, styluses. Finer pieces, such as the portrait bust from the second half of the 2d century of our era in the Vatican Library, were rare; how much the scarcity of finds is a matter of lessening interest in ivory and how much pure chance, it is hard to say. It is not until the 4th century, when there was a great revival of ivory work, that documentation becomes possible. It must be borne in mind, however, that these ivories — whether Christian in character or pagan but inherited by the Church or by monasteries — have been preserved because they were used as ornaments for furnishings or for sacred books. Certain it is that in the 4th century the art of ivory working reached a level comparable to that attained in Greece and in the the great preclassical civilizations of the Mediterranean world.

Gianguido BELLONI

The representative works of the Asiatic prehistoric cultures, for example, the Isakovo (3500–2500 B.C.) and the Serovo (middle of the 3d millennium), are carved in bone, horn, and ivory. Sufficient to remind us of this is the impressive head of a bear from Bratsk, which epitomizes in its realism a sculptural trend that was to find notable echoes in surrounding regions (see ASIATIC PROTOHISTORY).

The prevalence of metals, particularly of bronze, did not preclude production in ivory and bone; even in the period of the apogee of the so-called "art of the steppes," admirable works in these materials exist side by side with the considerably greater metallic output. It is chiefly the Scythian works — products of a culture linking Greek and nomad — that are of interest. The subjects, like those of the works in metal, are inspired by animals and conform to that highly original style which adds to a savage vigor a frequently virtuosic decorative sense. A spoon with bear's-head handle in Moscow, found at Chkalov and datable to the 6th–5th century B.C., a lion's head in fullface, and finally some heads of wild asses coming from the steppes of western Siberia but probably of Scythian inspiration indicate the technical ability and originality of Scythian ivory workers.

It is not beyond the bounds of possibility that accurate knowledge of the developed technique of ivory working reached India from the west — from Greece, Asia Minor, Scythia, and Persia. But this is only a hypothesis. Certainly there were typical local products: proof of this is the object known in Tamil as *kammal*, a small round instrument made in series (with increasing diameters) from the vertebrae of fish and probably designed to enlarge the ear-lobe perforation gradually through successive use. The *kammal* proper of southern India is related to various objects made from the bones of cows, the uses of which remain unknown. The excavations of Arikamedu (Virampatnam) have brought to light a great number of these objects, together with others of lesser importance — some of bone, some of ivory — which make it possible to follow the development of methods of workmanship. J. M. Casal, the discoverer, comments that he was astonished to find both types of objects characteristic of Virampatnam in excavations in the House of the Griffins on the Palatine, Rome, dating from republican times. We have here evidence of commercial exchanges, probably indirect, between southern Indian and Rome going back to the 2d century of our era. The *kammal* is thus important not only as an example of material and technique but also as a historical document attesting to exchanges between India and the classical world in a very early period.

As to Indian production proper, even though the techniques of ivory work were derived from the Asian and the classical West, and notwithstanding the paucity of documentation, there is no doubt that the art attained a high level of excellence. The discovery of an ivory statuette in Pompeii shows that objects of this kind found their way to the West and were valued in the markets of the classical world. The fact that the ivories of Begram, in Afghanistan, worked in a different technique and intended for different purposes, are unquestionably Indian in style (in part resembling those of Mathura, in part those of Amaravati) demonstrates that the Indian schools had, in this specific art form, attained such prestige that their works were well received even in regions themselves in contact with both the classical West and the Far East. A fuller account of the ivories of Begram is included in the section on India (see below).

Mario BUSSAGLI

IVORY WORK IN BYZANTIUM AND WESTERN EUROPE. The production of ivory increased in the West in the period that saw the end of the ancient world (PL. 240). Late-antique art and Byzantine art, with their Christian inspiration, seem to represent, rather than a point of arrival, a point of departure for the medieval world. As in every civilization and period in which the esthetic impulse finds its best expression in the minor arts, in these times ivories tend to assume, both in subject matter and in fineness of technique, the function performed in other periods by painting and full-scale sculpture.

From the 4th to the 6th century there were many centers of ivory production, and the assignment of single works, which must depend on iconographical and stylistic analysis, is still in many cases debated.

At first ivories with secular subjects predominated, but gradually these were replaced by works with religious themes. Among the former, particular importance attaches — because of their certain dating and high artistic quality — to the consular diptychs. These were sent out by the consuls as notification of their new dignity and as inaugural gifts; the outside was decorated with a portrait of the magistrate or sometimes a representation of circus games, and the inside was used for writing. Later the decoration of the outside was a framed medallion. The Roman series extends from the year 406 (Probus; Volbach, no. 1) to the year 530 (Orestes; Volbach, no. 31) and the Constantinopolitan series from the year 506 (Aureobindus; Volbach, nos. 8–14) to the year 540 (Justin; Volbach, no. 33). On some diptychs the figure of an emperor is represented, generally identifiable only with difficulty. Others relate to minor functionaries (Probianus; Volbach, no. 62) or allude to events allying two families (e.g., the Nicomachi and the Symmachi; I, PL. 301; Volbach, no. 55) or depict imperial apotheoses, hunting scenes, mythological episodes, the poet and his muse, and other themes. Besides the usual diptychs there are some with five plaques on each valve intended for the binding of manuscripts (the Barberini ivory in the Louvre; Volbach, no. 48). Cylindrical boxes carved out of the base of the tusk and intended as incense containers were also decorated with mythological scenes. Bone was frequently employed, often with sgraffito, for lesser objects such as combs, medallions, tesserae, handles.

Among ivories with sacred themes there were only a few diptychs (Adam and St. Paul, Florence, Mus. Naz.); these were disposed in several registers, with or without division. More numerous were the quinquepartite ivories used as bindings for codices (Milan, Ravenna, Paris, Echmiadzin). Of the many caskets, some were certainly intended from the beginning as reliquaries; there are some examples preserved intact (Brescia, PL. 240; Pola), others only in part (London). It is not clear whether certain detached reliefs with episodes from the life of Christ (Munich) and with Christ and the Madonna between saints were parts of caskets, bindings, and the like, or were independent devotional objects. Cylindrical pyxides with representations of sacred subjects (Berlin; Trier; Bologna; Florence; London; Pesaro, PL. 240), originally used for incense, then for the Eucharist, were made in considerable number. On the other hand, liturgical pectorals, medallions, and buckles for belts were few. Panels of ivory were widely used in episcopal thrones: a surviving example is the "throne of Maximian" in Ravenna (V, PLS. 340, 432); those once known in Trier and Grado are lost.

Byzantine production of works of art in ivory enjoyed a vigorous revival after the iconoclastic period, especially from the 9th to the 11th century, with emphasis on caskets decorated

769

with representations of mythological subjects. Some 50 complete examples are extant (Paris, London, Rome, Florence); they are of parallelepiped form with covers either flat or in the shape of a truncated pyramid (I, PL. 303; II, PL. 481). There are a few examples with Christian themes. Certain single leaves of ivory are of an official character (Coronation of Romanus II, Louvre); those of a religious character served as miniature portable altars (the Forty Martyrs ivory, Berlin, Staat. Mus.; Death of Mary, Munich; Last Judgment, London, Vict. and Alb.). There are also triptychs (Louvre, Vat. Mus.), sometimes arched, as in the case of the Virgin in Utrecht. Triptychs with scenes in several registers are less numerous. Still other reliefs, such as that with St. John and other saints enclosed by roundels in the Victoria and Albert Museum, served as book covers. Among the statuettes — a rare type — the Virgin in the Victoria and Albert Museum and the group in the Dumbarton Oaks Collection, Washington, D.C., dating perhaps from the 12th century, should be cited. The principal center of production was Constantinople; there were others, but they are rather difficult to identify with certainty.

When it comes to the rare pieces of Western provenance antedating the Carolingian period, we should take note of the quinquepartite binding of St. Lupicinus in Paris (Bib. Nat.), not forgetting the controversial hypothesis as to its Merovingian origin; of the Irish binding at Stonyhurst College, Lancashire, England, and of the Franks Casket with panels in whalebone in the British Museum (I, PL. 287). Carolingian ivory carvers (see CAROLINGIAN PERIOD) took up again the Early Christian types: diptychs in two or three registers (London, Milan), bindings of the quinquepartite type (London, Vatican), single reliefs for devotional use (Brussels, Paris, Munich, etc.). The centers of production — determined on the basis of stylistic similarity to groups of manuscripts — appear to have been Lorsch for the Ada Group (quinquepartite ivories in London, the Vatican); Reims for the Liuthard Group (Crucifixion in Munich; II, PL. 284); Metz for another important group (Crucifixion in London, diptych in Würzburg). There were other workshops in France and the Rhineland; the workshop of Saint-Gallen appears to have been connected later with these — as does a monk named Tuotilo (cover of Cod. 53, Saint-Gallen, Stiftsbib.).

In the Ottonian period (q.v.), while the French ivory centers declined those of the Moselle and Rhine regions continued to flourish; various workshops, not all of which can be satisfactorily localized (Crucifixion on cover of the Codex Aureus Epternacensis, Nürnberg, Germanisches National-Mus.) exerted an influence that reached the Netherlands and Liège. The workshop of Cologne began to take the lead, and it remained actively in operation throughout the Romanesque period. Other flourishing workshops were those of Reichenau (panels in Munich) and Bamberg (cover of the Würzburg Gospels). Besides bookbindings, liturgical combs, small buckets, liturgical knives, panels with imperial coronations and scenes of devotion, there were produced portable altars such as those of Melk and altarpieces such as that of Henry II for Magdeburg (now dismembered). Italian production (linked with the transalpine ivory centers) was rather slight between the 7th and the 10th century (pax of Duke Orso, Cividale, Mus. Arch. Naz.; binding of Berengar I, Monza, Cathedral Treas.; bucket of Gotifredo, Milan Cathedral). The diptych from Rambona (XI, PL. 326) is attributed to a Roman workshop.

In the Romanesque period other categories of objects in ivory made their appearance, among them tau crosses, crosiers, carved disks to serve as pawns, and other chess pieces (see ROMANESQUE ART). Ivory is also found used in reliquaries of complicated architectural form such as were produced by the school of Cologne (Eltenberg Reliquary in London; VI, PL. 261) and in caskets in the form of churches (Stuttgart). To the ever active German workshops, those of southern France, the Low Countries, and England were now added, and there was considerable use of bone at this time. In Italy there was a short-lived workshop in the north which either was in touch with transalpine workshops or was influenced by monumental sculpture (covers at Nonantola and Modena). But more important and more independent was the Salernitan workshop to the south, to which the altarpiece of Salerno Cathedral may be attributed. Among other works credited to this atelier are several tesserae from larger works since dismembered; the tesserae formerly part of the episcopal throne in Grado, on the Adriatic coast; the coffer in Farfa, in central Italy; and perhaps the coffer in Bagnoregio, near Orvieto, which is somewhat Arab in manner.

In the Gothic period (see GOTHIC ART) the French workshops, especially those in the general region of Paris, became preeminent, and their influence on the others renders classification difficult. Among sacred subjects the single statuette was considerably developed [*Virgin* from the Ste-Chapelle in the Louvre; *Virgin and Child* in Villeneuve-lès-Avignon (PL. 243)], as was the group [*Annunciation, Deposition* (PL. 243), and *Coronation* in the Louvre]. Triptychs have single figures or groups in high relief in the center, the subjects in the wings being arranged in various registers, often in an architectural frame (PL. 245). Secular works now included looking-glass mounts (PL. 244) and jewel boxes ornamented with depictions of episodes taken from romances, especially the Breton cycle.

In this period the German and English production of ivory carving slackened somewhat as compared with the enormous increase in France. Still more markedly in decline was Italian production: examples are few and of little value, and there is not always agreement about them. An exception is the *Madonna and Child* of Giovanni Pisano (VI, PL. 211), which reaffirms the relation between ivory and monumental sculpture.

Guglielmo MATTHIAE

In the 15th century, ivory work may be said to have entered a waning phase, although for the first few decades the late Gothic style maintained itself where there was still medieval resistance — as there was in Germany, Flanders, and France — to the new ideas. In Italy the workshop of Baldassare degli Embriachi was, from the late Trecento on, a particularly active center of ivory and bone working (in Florence and then in Venice); among the patrons were the Viscontis of Milan and the Dukes of Burgundy and Berry. In 1431 the sons of Baldassare, Giovanni and Antonio, inherited from their father a supply of both worked and unworked material, and they continued the atelier; besides small objects — caskets (PL. 242), diptychs, triptychs, and portable altars — the Embriachis produced monumental works such as the altarpiece of the Certosa of Pavia (PL. 245). Typical of their style was the fitting of reliefs into wooden frames decorated with certosina (i.e., minute geometric inlays of elephant ivory, bone, hippopotamus ivory, mother-of-pearl, and precious woods), a technique that had been used in the Trecento by the Carthusians. Through the Embriachis this technique found its way into the furniture made by the Lombard-Venetian workshops.

During the Renaissance, coincidentally with the slump in the ivory trade resulting from Turkish seizure of routes of communication to the East, there was a sharp decline in the quality of ivory carving in Italy: it was reduced to the level of artisanship by efforts to achieve effects and techniques of monumental sculpture little suited to the material, and to update it by employing the art of perspective. In the late 15th century some important works were still being produced [Florentine triptych in the Louvre, formerly attributed to Benedetto da Maiano; Mantegnesque reliquary in the Cathedral of Graz, Austria; *Triumph of Love* (PL. 246)]. In the 16th century the imitation of full-scale sculpture became rather pedestrian: imitations of Michelangelo, especially a then well-known crucifix type, abounded. In addition to small sculptures (sometimes, especially in northern Italy, of considerable excellence), the ivory workers made objects of everyday use carved and engraved with scenes of various sorts (hunting horns and powder horns, rosaries and frames, knife handles, chess pieces; PL. 244). Ivory began to be used again in intarsia, along with mother-of-pearl, for serving trays, display saddles, and furniture. In this field the tradition was to continue into baroque times in the typical Boulle work.

In the 16th century — the Portuguese having found a route to the East round the Cape of Good Hope and having established colonies in Africa and Asia — a new center of export arose, namely Goa, in India. Indian ivory was carved either in Goa or in Portugal and Spain (religious subjects especially were treated: crucifixes, representations of the Good Shepherd, rosaries, etc.).

The ductile quality of ivory fitted in with the baroque tendency toward virtuosity, and this, together with a new influx of the material resulting from the increased Dutch traffic in it, led to a revival of the art of ivory carving, especially in Flanders, Germany, and Austria (PL. 247). Some of the works produced, for example, the small horse in a net by the Sicilian Filippo Planzone (1604–30), in the Museo degli Argenti in Florence, and works in the Chinese taste by Johann Eisenberg (18th cent.) — a sphere pierced with four large holes, within which are smaller concentric spheres — are frankly exercises in ingenuity. But the greater number of ivories imitate monumental sculpture, especially in the 17th century, presenting in miniature not only the traditional crucifixes and Madonnas with saints, but also secular scenes, bacchanals, battles, landscapes in low relief, and groups of several figures in full round. Many ivory carvers treated themes from Roman history and from mythology in the picturesque style of Bernini and Rubens, often following prints from paintings. Among these artists were Gérard van Opstal (ca. 1597–1668), active in Paris, whose works include five bas-reliefs of Bacchic scenes and cupids in the Louvre, and Lucas Faydherbe (1617–97), whose *Dance of the Putti* in the Prado is one of his many decidedly Rubensian works. To the Flemish school belongs Francis van Bossuit (1635–92), who took Bernini as his model. The vitality of the Flemish school is demonstrated by the influence it exercised in Germany. In this period new items were added to the traditional repertory of ivory carvers: beer mugs, vases and centerpieces, frames for looking glasses, plates, furniture decoration, candelabra, scientific instruments, and others.

As we draw nearer to the 18th century and to the rococo taste, which in Germany especially struck a note of fantasy and caprice, ivory came to be used for all kinds of bibelots, from objects intended to be displayed in curio cabinets or behind glass in drawing-room china cupboards to accessories of costume. An extensive production of small portraits either in full round or in the form of medallions (a type known in antiquity) made its appearance, and ivory once more came into use for snuffboxes, handles for fans and cutlery, toilet articles, and the like. Combined with ebony — according to the method initiated by Simon Troger (ca. 1693–1786), who composed small groups (PL. 247) — and with various metals, especially silver, ivory and bone retained in their various applications a generally aristocratic character; indeed production was centered in the various princely courts. In Bavaria, at the court of Maximilian I (1597–1651), Christoph Angermair executed large chests — truly pieces of furniture — made entirely of ivory. In Augsburg, Georg Petel (VI, PL. 144) and Ehregott Bernhard Bendel (1668–1736) were active. Nürnberg saw two centuries of activity by the various members of the Zick family. The microscopically detailed and virtuosic carvings and the reproductions — sometimes macabre — of anatomical forms, all characteristic of the school of Nürnberg, can be skipped over, but mention should be made of such outstanding artists of the school as Leonhard Kern (1585/88–1662), Benedikt Herz (1594–1635), and, most particularly, Balthasar Stockamer (d. ca. 1700), who, employed by Cosimo III de' Medici, executed on the designs of Pietro da Cortona the *Hercules* and the *Hydra* in the Museo Nazionale, Florence. Finally, an admirable portraitist active from 1750 to the beginning of the 19th century was Michael Hammer.

The city of Ulm was known for a school of ivory workers founded in the second half of the 17th century by David Heschler and continued by Johann Michael Maucher (active in Würzburg from 1693 on), by the brothers Michael Knoll (1740–1800) and Wilhelm Benoni Knoll (d. 1764). In Dresden, Melchior Barthel (1627–72) was active, as was that Balthasar Permoser (1651–1732) who as a young man had been in Florence and worked for Cosimo III de' Medici, forming his style after Bernini and Pietro da Cortona. Members of the Lücke family were active at the Saxon court and in Brunswick.

Ranked among the finest ivory workers are Jacob Dobbermann, who was active in the first half of the 18th century (PL. 247), and Ignaz Elhafen, who was born in Nürnberg in the second half of the 17th century and worked in Italy, in Vienna, and at the court of Düsseldorf, following designs and engravings by Pietro Testa, Pieter Saenredam, Raphael, Charles Lebrun, and Pietro da Cortona. In Austria, Matthias Rauchmiller (1645–86), Johann Caspar Schenck (d. 1674), and Matthias Steinle (1644–1727) were the outstanding masters of the art.

Baroque France, after the decline of the Parisian ateliers in the 15th century, had flourishing workshops in Dieppe and in Normandy. Jean Cavalier, David Le Marchand (1674–1726), particularly esteemed in England, and Jean Mauger (ca. 1640–1719/22) were in vogue in all the princely courts. A noted dynasty of ivory carvers was the Rosset family of Saint-Claude, in the Franche-Comté. Joseph (1706–86), who was the ablest, assisted by his sons Jacques (1741–1826) and Antoine (1749–1818), executed medallions and busts of Voltaire, Montesquieu, Rousseau, and other celebrated persons of the time, reproducing their faces on the snuffboxes and caskets designed in series which were so much in fashion.

In the hierarchy of this art Italy held a place of lesser importance. Mention should be made of Antonio Leoni, who was born in Venice and was active in Düsseldorf 1704–16, and of Giovanni Battista Pozzi (ca. 1670–1752), who numbered among his principal patrons Prince Eugene of Savoy, and in Rome, Cardinal Alessandro Albani, whose collection of busts of ancient philosophers he reproduced in ivory.

In general, as has been said, in Europe the character of works in ivory is aristocratic; this is true even of the realistic efforts of Peter Hencke (d. 1777), who was active in Mainz; he seems to have invested his reliefs of drunken peasants with something of the burlesque and caricaturing spirit of a Brouwer and even to have created — as in the case of the anonymous tinker serving as a perfumeholder, in the Museo degli Argenti in Florence — works which are in effect genre yet belong in the aristocratic drawing-room.

In the 19th century, with neoclassic ideas holding sway for the most part in sculpture and architecture, ivory entered a period of pronounced decline despite the efforts made in several international expositions to improve its fortunes. Up to the middle of the century the ateliers of Saint-Claude remained in operation. In Italy Giuseppe Bonzanigo (1740–1820) was noted as a specialist in microscopically detailed work. In Belgium there was an ephemeral and artificial revival of ivory production following on the exploration of the Congo.

Current ivory and bone carving, whether in handicraft or in industry, has virtually no artistic significance.

Luigi SALERNO

IVORY IN THE EAST. *Islam.* In Islamic lands ivory carving in the round was rare. By far the greater proportion of ivories were executed in either relief or intaglio. There was also much *a jour*, inlay, and incrustation work, in addition to simple engraving and surface cutting. Among the objects produced were caskets, small boxes, and pyxides, hunting horns, chessmen, combs, sword hilts, as well as mimbars, cenotaphs, and door panels. In Christian Egypt, and later in the early Islamic period, bone was skillfully carved by Coptic ivory workers (III, PL. 445). In the Islamic section of the Staatliche Museen, Berlin, and in other collections there are a great number of revetment panels, originally forming part of pieces of furniture of some kind, which belong to the transitional period in the East between the Early Christian and the Islamic period. Some of these at least can be considered as pre-Islamic (i.e., ca. 7th cent.) and as Egypto-Coptic. They show without question a relation to the decorations of the façade of Mshattā — a relation that is made even clearer by the comparison of an example in Berlin with an ivory fragment in the Benaki Museum, Athens (cf. Migeon, 1917, fig. 146): that these two examples belong to the Ommiad art of the 8th century admits of no doubt.

773

A similarly transitional aspect is presented by some ivory pyxides, closely resembling one another, with slightly bulging bodies and cupola-shaped covers (mostly missing). They are decorated on the outside with relief carving of vine leaves and grapes springing from vases or developing into a clear spiral design; an example in the Victoria and Albert Museum has birds as well. There are other examples in Berlin (Staat. Mus.) and in Paris (coll. of the Marquis de Ganay). To this category of works also belongs a small basin in New York (Met. Mus.). In general there is a tendency to consider these Syrian works of the 6th to the 8th century; a later dating would ascribe them to the general vicinity of the Ommiad dynasty, during which the technique of wood carving had its flowering, about 800.

The Coptic tradition in Egypt was mainly one of using bone and ivory in wood — a type of intarsia work. Many intarsia works of arched shape (panels from cenotaphs; some at first erroneously thought to be bookbindings) are preserved in the museums of Cairo, Berlin, and New York. Their origin can certainly be placed in the 8th and 9th centuries, and their Islamic character is equally certain. It is possible that the technique was also practiced in the Tulunid period (9th–10th cent.), but no examples of this period remain. Nor is there any known example of Abbasside ivory work.

A large ivory pyxis preserved in the Church of St. Gereon, Cologne, takes us into an entirely different area of Islam. An Arabic inscription on the cover states that the pyxis was made in Aden for the emir 'Abd-Allāh ibn-al-Rabī', governor of Yemen from 775 to 780. This established provenance is of particular importance, for it raises the question whether a whole series of other objects which have the same decoration of concentric circles and points also come from southern Arabia. At issue chiefly is a group of chessmen that have always been assigned to the first Islamic period (8th–10th cent.). Because of their close relation to other small objects of bone decorated in the same primitive way and indisputably going back to the Coptic era, an Egyptian origin had been previously postulated for the entire group.

A type of work in the round made at a relatively early date was the chess piece (analogous to the Western bishop) known in the East as the "elephant" (*al-fīl*); a 9th- or 10th-century example, perhaps from Mesopotamia, is in the Museo Nazionale, Florence. Entirely different is the imposing carving of an elephant in the Bibliothèque Nationale, Paris, which comes from Saint-Denis and is thought to have been a gift from Hārūn al-Rashīd to Charlemagne. It could reasonably be taken for Indian if there were not on the lower part of the base an inscription in Arabic referring to a master named Yūsuf al-Bahīlī, perhaps an Iraqi. This ivory can be placed somewhere in the 10th century, and it may be connected with the Arab conquest of the Indus Valley. A smaller elephant from Saint-Denis, even more markedly Indian, is from about the same period.

The first example of ivory painted in several colors dates from the 10th century: a chest, rather large and flat, in the Museo Arqueológico, Madrid, has a long inscription in Kufic characters with Shiite formulas, which mentions the Fatimid caliph al-Mu'izz and states that it was made at his residence, Sabra al-Manṣūriya, near Kairouan in Tunisia, in other words, before the move of the caliph to Egypt following his conquest of that country; thus it must have been made between 952 and 969. This chest, however, has a rather isolated place in the ivory work of the Islamic world, in which the technique of painting was taken up again only later, and then in Sicily, a region culturally and geographically close to North Africa.

It is interesting to note that the art of ivory carving, the beginnings of which can be traced to the Ommiad period, did not develop in the East proper but rather in Islamic Spain, chiefly in Cordova, the very capital of the descendants of the first dynasty driven out by the Abbassides; it is a warranted conclusion that the ivory workers emigrated from Damascus, where, in the 8th century, the art had had its first efflorescence, to Andalusia, and there worked at the court of the Ommiads. The examples that have survived go back no further than the 10th and 11th centuries, but they are unquestionably products of a high order of craftsmanship that presupposes earlier stages of development.

Fortunately the works are so frequently inscribed (always on the lower rim of the cover) that in many cases we have not only the name of the commissioner of the object but also a definite and indisputable date; in some cases women of the caliph's family are named as purchasers, and a poetic inscription on one pyxis (D752, Hispanic Society of America, New York) declares that it was intended to hold sweet-smelling essences. It is established that the guild of ivory workers was active not only in Cordova but also at the palace of Medina az-Zahra built outside the gates of the city by 'Abd-er-Raḥmān III. On a box in the Instituto de Valencia de Don Juan, Madrid, which is dated 966 and was intended for a princess, Medina az-Zahra is named in the inscription as the place of manufacture; the decoration, rather deeply carved, consists, as in the pieces previously mentioned, almost exclusively of arabesques and foliage. Dated two years earlier, 964, is a splendid pyxis from Zamora (Mus. Arqueológico, Madrid); the decoration shows peacocks and gazelles scattered against a background of foliage of Moorish type.

In this period we encounter for the first time the name of one Ḥalaf, an ivory worker, whose signature appears on a box dated 966 in the Church of Fitero (Navarre) together with the name of Medina az-Zahra as the place of origin. It is his name that appears, too, at the end of the inscription on the imposing pyxis in the Hispanic Society in New York, which extols its own beauty as well as the precious purpose it serves. From a different workshop, but also dated 966, is a small casket in the Musée des Arts Décoratifs in Paris.

Here follows chronologically a splendid series whose place of origin — whether Medina az-Zahra or Cordova itself — is in question. Three pyxides are chiefly concerned: one in the Louvre, dated 968; one of the same period in the Victoria and Albert Museum; and a third, without a lid, again in the Louvre. All three show, in a series of medallions, various figural scenes taken mainly from court life (princes on their thrones, musicians, falconers, elephants, etc.) but also from the late Byzantine and Sassanian worlds (Dioskouroi, birdcatchers, pairs of horsemen beside a tree of life, animals fighting, etc.). Some of these motifs, used in disregard of the Moslem prohibition of the rendering of figures, are a novelty in Islamic art, so that there is a crying need for a more exact history of these works.

A casket in the Cathedral of Pamplona made in 1005 for the minister 'Abd-al-Malik, as is clear from the inscription, marks the end of this brilliant period. It shows the same repertory of motifs as the above-mentioned pieces but so far surpasses them in profusion of figural composition as to rank as the outstanding work of the Cordovan school. Four signatures of ivory carvers can be deciphered in different places, from which it can be concluded that we are dealing here with the cooperative work of a large atelier. Roughly contemporaneous is a pyxis in the Cathedral of Braga (Portugal), a more modest work but elegantly carved with arcades in relief. This too was commissioned by the minister 'Abd-al-Malik, who fell in 1008. As the last example of the series we may mention a casket in the Victoria and Albert Museum.

The decline of the power of the caliphs of Cordova in the first half of the 11th century meant the end of Cordova's ivory industry. The ivory workers found a new field of activity in Cuenca, in Castile, under the protection of the Dhul-Nunid dynasty, which had come into power in Toledo. A casket in Burgos which comes from S. Domingo de Silos bears an inscription stating that it is the work of Muḥammad ibn-Zayān, created in the city of Cuenca in the year 1026. There is an entirely new orientation in that the decoration of animal motifs — somewhat crude as to detail — is very different, being arranged on the surfaces in horizontal bands rather than in medallions, with hunters placed here and there. The cover, on the other hand, with its birds and intricate scrollwork, reminiscent of the Ommiad taste, reflects the tradition of the Cordovan school. A casket from Palencia in the Museo Arqueológico, Madrid, also appears to be close to the Cuenca workshop (PL. 242); its date is 1049.

The caskets and boxes mentioned above, like the pyxides, were probably originally colored with paste and enlivened with

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

gold backgrounds. They had locks and hinges of gilded silver, often replaced later by coarser ones. Most of these objects came rather early into the Christian West; in princely houses they served as jewel boxes, in churches and monasteries as reliquaries.

That Arab ivory carvers also served Christian clients even before the definitive conquest of the Kingdom of Toledo by the Castilians (1085) is certain. An outstanding example of their work is a processional cross of which part is in the Louvre and part in the Museo Arqueológico, Madrid; the three arms that are preserved come from San Millán de la Cogólla, as do some small strips with very similar decoration in the Madrid museum which once served to adorn a portable altar and which are surely of the 11th century.

While in the latter half of the 11th century the Islamic ivory art of Moorish Spain was gradually dying out, other centers of ivory production with quite different aims were flourishing. It was now principally the hunting horn that was the object of artistic adornment. The legendary ivory horn — named "Olifant" — of Roland may have given rise to the manufacture of these magnificent objects, all of which go back to this prototype and thus have been invariably associated with this paladin of Charlemagne. It is probably true that these *tubae eburneae*, as they are called in medieval sources, were part of the equipment of royal personages. It is curious that there is no trace of their use in the East and that they are found only in the Christian West — the more so since a great number of them give clear evidence of Saracenic workmanship.

Among the ivory horns that have come down to us, about 30 in all, three types can be distinguished. The first is best represented by the so-called "horn of Charlemagne" in the Cathedral of Aachen, which, together with another in the Staatliche Museen, Berlin, stands at the head of the series. In the second type (Berlin, Paris, London, Edinburgh, Stockholm, New York) the entire surface is decorated with animal motifs except for the links to which the pendant is attached, which are in the form of medallions. Of the third group there are characteristic examples in Florence (Mus. Naz.) and in Brunswick; in these the animals are arranged in vertical bands, in circles, or are freely rendered around the rim of the horn.

In both composition and details these ivory horns reflect the Fatimid style as it developed in the 11th and 12th centuries in Egypt and Syria (PL. 244). But certain peculiarities, as well as the occasional occurrence of motifs alien to Islamic art, suggest a contact with the Byzantine and pre-Romanesque art of the West; if we are here dealing with works by Arab artisans, the possibility must be entertained that they were resident in Sicily or southern Italy. The case was also reversed, for example, in Apulia, where Christian sculptors from time to time came under the influence of their Saracen fellow artisans. In this connection should be mentioned a very small number of oliphants bearing the same decoration as the second group mentioned above; these are so mediocre in execution as to have been at times taken for forgeries but have recently been recognized as Romanesque imitations of Islamic models. Contemporarily with the horns here described and clearly in the same workshops were produced caskets, doubtless for jewels, similar in form to, but slightly larger than, the somewhat earlier Spanish ones. Only a few of this type are preserved (Berlin, New York, Mastricht, Leningrad).

At a relatively early date, both boxes and horns were given, after they had served their secular purpose, to churches and monasteries, where they found use as reliquaries and were specially valued because of the costliness of their material. Fatimid elements and strong Saracen influence are also present in liturgical objects for Christian use. In England, it is clear, the oliphant type of horn was particularly widespread, and it seems that ivory drinking horns served as feudal attributes, the inscribed "tenure horn" constituting the official record of the bestowal of a grant of lands.

In this entire group of works in ivory, not one bears an inscription in Arabic, which is further reason for questioning their Islamic origin. It is especially difficult to localize their provenance with any certainty, and we must be content with purely hypothetical attributions. Detailed study of the carving shows that they are close to Egypto-Syrian artistic trends, and this seems to justify the Fatimid thesis. Chiefly it is a matter of ivory (more rarely bone) panels used as covers, rectangular or polygonal in shape, sometimes curvilinear, with arabesques, animals, or human figures carved in high relief, and the background showing; originally these must have been affixed to wooden caskets or strongboxes or to pieces of furniture. An especially fine series is preserved in the Museo Nazionale of Florence (PL. 242); another is in the Staatliche Museen, Berlin. Figures of musicians, dancers, revelers, hunters on foot and on horseback, and peasants are seen against a background of vine trellises; the closest parallels to these are some friezes in Cairo (Mus. of Islamic Art) from the destroyed western palace of the Fatimids, which are very similar in decoration. Thus the ivory panels may go back to the 11th century; according to Maqrīzī, many ivory boxes decorated with such panels were included in the treasure of the Fatimid sovereign al-Mustanṣir (1035–94). Fragments have been brought to light in the ruins of Fostat (Old Cairo), and in no case is it possible to speak of any degree of adaptation, as in the case of oliphants, to Western conceptions.

When it comes to the category of ivories that are not carved in relief but painted and gilded — for the most part jewel boxes, pyxides (known to have served to contain the Host), and combs — the time and place of production are rather easily determined. The material here could be much thinner than in the case of the carved ivories; the painting was done in red, green, and blue with black outlining, and gold was applied either in paint or in leaf. In many cases the decoration has of course been partially or wholly worn off. In addition to medallions with arabesques, a variety of animal motifs, falconers, harp players, and so on, there are subjects that are unquestionably Christian. However, the fairly frequent occurrence of Arabic inscriptions, in Kufic or in cursive script, mostly with wishes for the anonymous owner, proves that we are here dealing with the work of Saracen artisans. Of about 100 works of this type examined by P. B. Cott (1939) and J. Ferrandis Torres (1935–40) the most important are a small box in Berlin (Staat. Mus.), a box with flat cover and single figures in the Cathedral of Würzburg, and a third box, somewhat later in date, in the Cappella Palatina in Palermo.

Following tentative attributions to various Eastern countries, eventually general agreement was reached that most arguments speak for an origin in Sicily in the 12th and the early 13th century, that is, in the Norman and Hohenstaufen periods — which is further corroboration of Arab workmanship. Some late-13th-century pyxides with very shallow carved decoration on the front only (grapevines with birds, hares, etc.) in the museums of Paris, Lyons, and Cairo, which have close connections with the painted ivories in design, may be of Sicilian origin, even though they are no earlier than late-13th-century. That works having ivory intarsia, such as the well-known chest in the Cappella Palatina in Palermo, are Sicilian has been questioned by U. Monneret de Villard (1938), who holds that they stem from Egypt, where the technique had a long tradition. But stylistically they can be fitted neither into the Fatimid nor into the succeeding — the Ayyubid — trend, and further examples in the same technique, in a more evolved phase, found in Spanish cathedrals (León, Tortosa) can hardly have originated elsewhere than in the Spain or Sicily of the 13th century, given their suggestion of Western motifs. One of these caskets bears the signature of a certain Muḥammad ibn-al-Sarrāj. A small group of related panels of excellent workmanship in Ravenna (Mus. Naz.) and Leningrad (The Hermitage) may be considered as *mudéjar* modifications of Moorish carving; decorated with single animals and animals in combat, on a ground of vines, they show Arabo-Gothic influence and probably date from the end of the 13th century.

An important decorative function in association with architecture accrued to ivory carving (though limited to plant motifs and inscriptions) in the period of Cairo's ascendancy under the Mamelukes (see MAMELUKE ART). Whereas at first in decoration of borders of doors and mimbars only wood intarsia was used, now more and more often larger or smaller ivory panels with very delicate arabesques are found, and sometimes

777

even the whole surface, with dedicatory texts, is carved in the more precious material. Among objects of daily use, boxes with simple, closely carved geometrical decoration and marginal inscriptions were popular — a weak reflection of the once highly developed ivory industry.

This essentially completes the story of medieval Islamic ivory carving. Mention should perhaps be made of the scimitar and dagger handles among the Moorish arms of the 14th and 15th centuries; these — at times very richly adorned — played a greater role in Persia and India in the 16th–17th century but were later often executed in narwhal ivory, which looked much the same but was cheaper than elephant ivory. The powder horns enlivened with figural motifs of all sorts suffered the same substitution. Small objects in ivory, such as inkwells, boxes, and toilet articles, were produced in the Islamic East up to recent times; these pieces, though in many cases very tasteful, are insignificant in the artistic development of ivory carving.

Ernst KÜHNEL

India. The use of ivory and bone in India before the Christian Era is attested by the finds from Taxila in the Punjab (West Pakistan). According to Sir John Marshall several of the objects antedate the 2d century B.C.; a greater number, from the earliest of the successive sites, the Bhir mound, and from Sirkap, the next site chronologically (i.e., the Taxila of Parthian times), belong to the period extending from then to the 1st century of our era. Mostly these are objects of daily use: personal ornaments, articles for the toilet and for domestic use, pieces used in games. But many of the finds seem to have been imported, and according to Marshall the origin of the ivories of Taxila must be sought in Greece and western Asia. This opinion is in accord with A. K. Coomaraswamy's view that the use of ivory had a non-Indian origin.

However, the existence of ateliers of ivory workers in India before the beginning of our era is known from an inscription on the south portal, or torana, of the Great Stupa of Sanchi; according to this, the guild of ivory workers of Vidisa (mod. Bhilsa) executed and donated this, the most ancient torana, which dates according to A. Foucher and Sir John Marshall from the 1st century B.C. The ivory figurine of Indian workmanship found in Pompeii confirms the activity of Indian ivory workers at a date only slightly later.

The figurine from Pompeii has been linked with the female figures depicted on the Great Stupa of Sanchi, and with the torso of a woman from the same site, by P. Stern, who has pointed out definite similarities in headdress and costume. These and other similarities of iconography and attire (the double belt, the heavy headdress, and the great braids of hair, falling in an arc down the back) establish the work as contemporaneous with the three later toranas (north, east, and west) of the Great Stupa — in other words, as belonging to the beginning of the Christian Era. Four mirror handles, of which three are more or less similar, found at Taxila must be from a period hardly more recent. The rather coarse look of the female figures suggests work that is local but inspired by Indian models. A comb also from Taxila has, on the contrary, real artistic merit. It was discovered at Sirkap in the stratum belonging, according to Marshall, to the 1st century of our era, and the style and the motifs seem to establish an Indian origin. This piece with intaglio carving has with reason been regarded by A. Ghosh as closely connected with the ivories from Begram and, in the treatment of the figures, with the sculpture from Mathura and Amaravati.

However valuable, the data concerning ivory carving in ancient India supplied by these works remain fragmentary. Quite a different range is presented by the Begram finds, an important group of objects in ivory and bone discovered in 1937 and in 1939–40 in the course of excavations by J. Hackin, Ria Hackin, and J. Carl. The first lot was discovered in a walled-up room in the royal palace: Begram (anc. Kapisi), was the summer residence of the Kushan dynasty. The 1939–40 excavations brought to light further objects, and here again ivories of Indian origin were found with Hellenistic-Roman glass and bronze (chiefly from Alexandria), and with fragments of Chinese lacquer. The ivories from Begram are above all close in style to Mathura and go back to the "half century following the advent of Kanishka" — a still disputed date somewhere between the end of the first and the middle of the 2d century of the Christian Era.

Some rare figurines of good size and some motifs in console form have been found, but the bulk of these ivories are bands and rectangular plaques used to decorate furniture (chairs, stools, and perhaps small chests). The frequency of feminine themes — scenes of dressing and of diversion — justify the belief that these objects appertained to a gynaeceum. The photographs, sketches, and notes made in the course of the excavations by J. Carl made it possible for P. Hamelin to reconstruct the general appearance and the decoration of several chair backs and footstools. Their form was already known through their representation in reliefs in the style of Mathura and Amaravati, particularly the curving upper band above the backs supported by console-shaped motifs alternating with decorated plaquettes and finely turned colonnettes. Frequently covered by a strip of mica, the plaquettes were affixed to the wooden structure by copper nails or by ivory pegs. Various techniques were utilized in executing the lively scenes and ornamental motifs decorating these bands and rectangular plaques, all of which reveal great technical ability, even virtuosity (PL. 241).

The scenes represented on some of the plaques relate to an episode identified by A. Foucher as belonging to a Jātaka (story of the previous life of the Buddha). All the remaining scenes appear, on the other hand, to be of purely secular inspiration: graceful female figures are represented in groups of two or three — sometimes accompanied by children or domestic animals — busying themselves at the toilette, or making music, or playing ball, or gathering flowering branches, or enjoying sweets. Sometimes a larger group gathered round a seated personage of importance evokes the brilliant atmosphere of the court scenes depicted at Amaravati. Other plaques show only one or two female figures standing under a torana in one of the undulant poses that are so typically Indian. One of these attitudes — "dancing" and, as it were, "falling" — has been compared by Stern to the same posture occurring in works in the Mathura style.

The decorative motifs coincide in general with the ornamental repertory of works more or less contemporaneous (Sanchi, Amaravati, Mathura especially). Many of these subjects are definitely Indian, or if of foreign origin, are already strongly Indianized. Several motifs are of Western inspiration, particularly a rinceau with tendrils (found by J. Hackin in Roman art of the 1st century of our era, and also to be found in Persia) and a complicated motif that gives rise to the rinceau. The association of human faces and of the heads and protomas of animals recalls a similar association in the carving known by the Greek term *grylloi* and probably of Mediterranean origin.

The excavations of 1937 also brought to light three large female figures carved in very high relief and of unusual dimensions (ca. 20 in. in height). They stand on a *makara* (fantastic marine animal), and thus relate to the decidedly Indian theme of river goddesses — of which they are among the oldest representations. One of them, however, wears a long tuniclike robe of very light material and of foreign type.

In spite of these foreign strains, the ivories of Begram — now in the Kabul Museum (PL. 241) and in the Musée Guimet, Paris — are essentially manifestations of Indian taste and are close to the indigenous styles: to that of Mathura in the first place and then to the style of the Great Stupa of Sanchi and to the style of Amaravati. Seen from another angle, reflecting as they perhaps do the decoration of vanished palaces, they remain the sole witness to the secular art of ancient India.

The references to ivory objects in literature alone testify to the esteem in which this artistic genre was held during the Gupta and post-Gupta periods. With the discovery of an ivory in early Pala style, an interesting find made in 1854–56 in the Province of Sind became even more valued. Northeast of Hyderabad, at a site identified as being that of the old city of Brahmanabad, A. F. Bellasis discovered, in fact, several ivory figures, which appear to have decorated a coffer or a number of coffers. These pieces, of which the largest is about $4^1/_2$

inches high, are chiefly standing female figures, very *hanchées*; they often hold a lotus in one hand and a scarf in the other, and one is looking at herself in a mirror. According to D. Barrett these ivories, preserved in the British Museum, are near in style and iconography to the art of central India in its westernmost aspects, that is, in Gwalior and Malwa; he notes certain resemblances to the sculptures of the temples of Candravātī (Jhalawar, Malwa), which seem to be 10th-century or slightly earlier. Thus the ivories discovered by A. F. Bellasis may go back to a comparable date.

The later Indian ivories are numerous and better known, testifying to the activity of many workshops in very diverse parts of the country: first of all in the south, in particular Ceylon and Travancore; then in Mysore; and to a lesser degree in north India and Orissa. The museums of Colombo and London own fine collections of pieces from Ceylon, some of which go back to the 15th century. The variety of objects in ivory is very great, ranging from images of the Buddha and a variety of statuettes to handles of all sorts, combs, book covers, and coffers made of ivory plaques held together with metal mountings. There are perfume atomizers so thin that they can be squeezed. Architectural appliqués of ivory are recorded in the *Mahāvaṃsa* (historical chronicle of the island of Ceylon), which, as early as the 12th century mentions a royal park in Ceylon "girdled by pillars with rows of representations in ivory" and a pavilion built of this material. Such ivory appliqués are seen on the posts and the lintels of entrances. In the Ridi Vihara in Ceylon pierced ivory is combined with ebony in door frames. In the same region there are, among the pieces in bas-relief, plaques representing the gate guardians, or *dvārapāla*s, placed on either side of monastery doors.

The old techniques reappear: on the one hand, ivories incised or carved in low relief, against a ground either smooth and plain or pierced, and, on the other hand, turned ivories. Examples of ivory incrustation and appliqué are numerous; some still can be seen at the palace of Tanjore. Coomaraswamy (1913) mentions two chairs, of the 17th or 18th century, decorated with ivory plaques enriched with colored lacquer. In this type of work, first the surface of the ivory is engraved and then the lacquer is poured hot into the incised parts; after scraping and polishing, the design appears in color on the ivory ground. The process is still in use in Tanjore, particularly for musical instruments, and also in Mysore and Ceylon. The work done in Travancore is allied to the Singhalese traditions: many of the ancient Indian motifs are retained. The 18th-century objects have a beauty that is still in evidence in more modern examples. Coomaraswamy notes that the Travancore ivories preserved a purity of design, while those of Ceylon and Mysore fell into an obvious decline as a result of the effort to detach the figures from the ground by exaggerating the relief. The works from Mysore had, however, given evidence of true quality in the 18th century (VII, PL. 491), and the region had been a center of work in ivory incrustation; black lacquer also was used.

Northern India too had its centers of production. In Orissa some fine ivory statuettes of the 18th century maintained the tradition of earlier Indian sculpture. The inlaying of ivory in wood — often in sandalwood — was an art especially developed in the Punjab (chairs, small caskets, musical instruments, and even the decoration of doors, as in the Golden Temple at Amritsar). Subtle floral ornament inspired by the Moghul style predominant in northern India from the 17th century on is frequently found: delicate flowered sprigs curve up and down or form harmonious rinceaux. The doors of the palace in the city of Amber and of the Bari Mahal in Udaipur were covered with a veneer of ivory plaques in Moghul style showing hardly any Hindu influence.

Madeleine HALLADE

CHINA AND JAPAN. In the Paleolithic age, man seems already to have been making articles of bone, as can be inferred from the fact that fragments of objects of bone, indented or notched, were found with the skeleton of Peking man at Chou-k'ou-tien. Among the other finds from the site are earrings of bone and other personal ornaments made by piercing holes through the dogteeth of animals of prey — all presumably Middle Paleolithic. Ivory and bone carving emerges into the light of history in the Shang dynasty (ca. 1523–1028 B.C.). By this time fair progress seems to have been made in processing various materials; the art of casting bronze vessels had attained notable refinement. In An-yang, which is thought to have been the center of Shang civilization, pail-shaped vessels of ivory have been excavated. These were made of the thicker part of the elephant tusk, the base of the tusk forming the mouth of the vessel; inserted in the other end was a raised bottom. The surface of these vessels is carved with a row of motifs, each resembling a cicada as viewed from above. In the lower part is carved a design of a monster. These motifs are much the same as those found on the bronze vessels of the period. There have also been found in An-yang and its environs a number of bone receptacles with exquisite *t'ao-t'ieh* designs (III, col. 476) carved on them; among these finds are fragments presumably of vessels for wine and spirits. Ornamental bodkins made of bone and fish-shaped pendants of ivory (ca. 1 in. long) have also been brought to light in the same area. Nor is this all. There have been recovered a quantity of fragments bearing carved characters indicating that records of the time were incised on tortoise shell and animal bone. Among the decorative designs on bronze utensils of the Shang dynasty are some representing the elephant. The Freer Gallery of Art in Washington has a bronze piece of the Shang dynasty made in the shape of an elephant (III, PL. 224). It may be inferred that the nobility of the Shang dynasty had a strong interest in and appreciation of elephants and ivory.

From the Chou through the Han dynasty (ca. 1128 B.C.–221 B.C.) ivory carvings must have been turned out in some quantity, but the ivory works that have come down to us are not abundant. From ancient Chinese sources we learn that in these dynasties ivory was used for seals, and for the staff or baton (*hu*) borne by dignitaries when wearing ceremonial dress and that vehicles were decorated with ivory carvings. We learn too that craft products of ivory and rhinoceros horn were noted local specialties of Ch'ing-chou and Yang-chou, and that during the Han dynasty ivory wares of exquisite workmanship were imported from Rome. Another Chinese source states that in the 4th century an ivory tower was sent to China from India as a present, and it seems likely that all sorts of ivory works of Indian make had found their way to China prior to the Han dynasty. It is also recorded that Chinese ivory workers carved Buddhist images in ivory in the 6th century. With the establishment of the T'ang dynasty in the 7th century, the use of ivory in China grew more and more extensive: it became a favorite material for articles of luxury used by the aristocratic class. Surviving ivory works from the T'ang dynasty are not plentiful, it is true, but, judging from the records, the poetry, and the relics of the time, the art of carving in ivory must have enjoyed considerable development during this dynasty.

It is worthy of note that the China of the T'ang dynasty apparently was considerably influenced by the ivory art of Europe, the Near East, and India, as a result of the vigorous interchange carried on with India, Persia, and Byzantium; it may be that many of their products were brought into China. Numbered among such imports must be the portable shrine adorned with carvings in ivory depicting a Jātaka (Lanchow, Kansu Provincial Mus.); it was presumably made in India in the 8th century.

Works of art of the highest quality were produced for the emperors and high officials of the T'ang dynasty in the government workshops, and it was probably in these shops that the production of superior works in ivory centered. Ivory tusks were evidently imported from Annam and Burma, but elephants were bred in China too, it is said. The various ivory works produced during the T'ang dynasty may be divided roughly into two groups — those entirely of ivory and those in which ivory is combined with other materials. The former include plectrums for string instruments, flutes, rulers, the stones used in the game of *go* (Chinese chess), *hu*, combs, hairpins, jewel boxes, and small folding screens; the latter include boxes, furniture, stationery items, and musical instruments.

781

The techniques employed are of two kinds. One, featuring skill in relief carving and openwork, presents ivory in its natural color, while the other, in which designs were engraved on the dyed surface of ivory, reveals the true color of the ivory only in the carved parts. The latter method, the technical term for which is *po-lou*, was much in demand for its capacity to produce an effect at once pictorial and ornamental. Another decorative method extensively practiced was inlaying ivory, that is, inserting a veneer of ivory in the surface of an object made of another material. The use of ivory for the *hu*, which was an attribute of the most exalted personages of ancient China, is a measure of the esteem in which this material was held. Rhinoceros horn was also held in high esteem, as is clear from the facts that it was carved into winecups, and that inlays of rhinoceros horn were applied to utensils.

During the Sung dynasty (10th–12th cent.) both ivory and rhinoceros horn were imported from Persia and Arabia. That the techniques of inlaying and carving ivory and rhinoceros horn were handed down from the T'ang dynasty is known from literary sources. Works whose dating is so clear as to establish them as having been handed down from the Sung dynasty are few and far between.

Fukien was famous as a center of ivory carving during the Ming dynasty (14th–17th cent.; PL. 248). Chief among the ivory carvers of the Sung dynasty were Fang Ku-lin, Chu Hsiao-sung, and Chu Lung-ch'uan; the leading artist in rhinoceros horn carving of the same dynasty was Pao T'ien-ch'eng. The ivory works of the Sung dynasty include seal boxes, incense cases, folding fans, and chopsticks, all adorned with carvings — of landscape with several-storied structures, of human figures, and of flowers and birds. These works are not so elaborate in detail as the products of the Ch'ing dynasty (17th–20th cent.; PL. 248), but artistically they have greater merit. A number of Buddhist images and figures of lohan (Buddha's disciples) carved in ivory have come down to us from the Ming dynasty; these are works of art giving evidence of skill raised to a very high level.

During the K'ang-hsi era of the Ch'ing dynasty a number of manufactories were established in Peking for the purpose of supplying the Court, and one of them had a department devoted to ivory carving. Skilled artisans for this workshop were assembled from all parts of the country. Chief among the types of articles produced there — all artistic works of a high order — were the *wan-chên* (hand rest used in writing small characters), *pi-tung* (cylindrical vessel to hold writing brushes), *pei-p'an* (stand for a winecup) *ho-tzŭ* (small vessel with lid), seal boxes, *ju-i* (originally an object held by a Buddhist priest while preaching, later a room ornament), *ch'a-p'ing* (single-leafed screen), *kua-p'ing* (hanging tablet), chairs, and *wei-p'ing* (folding screen). All these were ornamented with carving; the decorative motifs included a Taoist hermit, the *tao-shih* (a supernatural being who figures in Taoism and Buddhism), birds and animals, a several-storied structure, landscape, fruit, flowers, poems. The carvings are sometimes in relief, sometimes in line engraving, sometimes in openwork, and sometimes in the more elaborate technique known as *lou-k'ung* (in which the cutting is done in such a way as to give the effect of a carved object set in a concavity). Still other works are colored with pigment or dyes. Very few of these ivory carvings bear marks showing when they were made. The so-called "medical ivories" belong to a separate category. Small reclining female figures, generally nude or lightly clothed, they were used by Chinese women when consulting a physician to indicate their symptoms without a physical examination.

Among the ivories that European nations imported from Ch'ing China and from the Chinese Republic are fine specimens of *sa-shan* (folding fans) and *tao-ch'iu*. The latter is a series of several detached concentric spheres carved ingeniously within a pierced ivory ball; each sphere is decorated with a different openwork design. Some *tao-ch'iu* have more than 10 inner spheres. These spheres within a sphere are begun by carving a ball out of a piece of ivory. Then several holes are pierced from the exterior toward the center. The knife is then thrust in to carve a central ball about $^1/_4$ in. in diameter. The outer spheres are then carved, one after another, till the *tao-ch'iu* is completed. A similar technique is applied to the carving of an ivory ornament of which the nucleus is a carved palace, with chairs, folding screens, human figures, and even tinkling bells and lanterns hanging from the eaves represented inside. The traditions of the dexterous Ch'ing ivory carvers have not been lost; the Chinese ivory industry flourishes in Kwangtung province. With a view to further improvement in quality the Chinese government has required the formation of a cooperative association to handle the production of ivory works of all types, from choice ornaments such as *tao-ch'iu*, down to articles of daily use such as chopsticks and combs.

In Nationalist China (Taiwan) the use of ivory is rare, but carvings in bone and horn are being produced. Buffalo horn is the material commonly used, the chief products being combs, buttons, flower vases, *shui-ti* (tiny vessels for holding water used in preparing India writing ink), smoking pipes, paperweights, paper knives, and dishes.

In the Neolithic age in Japan, that is, the age of the Jōmon earthenware culture (200 B.C. or earlier) various articles of daily use were made of bird and animal bone or horn: bone fishing hooks, harpoons, combs, hairpins, sewing needles, girdle pendants, and so on have been dug out of shell mounds. The decorative designs on these works are akin to those on earthenware of the Jōmon (lit. rope-pattern) type. Carvings in deer horn have also been dug out of shell mounds. Bone and horn thus have a much longer history in Japan than does ivory.

In the history of ivory carving in Japan the two high points are the 8th century and the 18th century. The Asian continent and Japan have of course had close cultural relations from earliest times, and it is therefore quite possible that the technique of ivory carving came to Japan from China even before the 8th century. But it would be difficult to prove this from the extant remains, though many 8th-century ivories survive.

In the Aëneolithic age, following the Neolithic, bronze and jade works evidently began to be made; perhaps personal ornaments made of bone or horn gradually came to be replaced by articles of these new materials. The use of deerhorn was apparently maintained; from ancient tombs of the 5th century there have been excavated specimens of relief sculpture in horn on scabbards, with designs based on crossing straight lines and curves. As for the *magatama*, the comma-shaped ornaments, often of jade, that were the characteristic personal adornment in ancient Japan, there is a body of opinion which holds that their curved form is a conventionalization of the shape of animal teeth or tusks; be that as it may, 4th- and 5th-century *magatama* were chiefly of stone and glass. With the introduction of Buddhism into Japan from the continent in the 6th century, various handicraft techniques were also imported. Such techniques developed in Japan along with the growing practice of adorning Buddhist temples in a style according with the extravagant life led by the aristocracy of the time. In 8th- and 9th-century Japan it became the fashion among the nobility to ape the T'ang culture of China, and it was natural that the ivory art of the T'ang dynasty should be welcomed in Japan. It seems that ivory as a material was imported from China. So strong was the influence of Chinese culture that it is next to impossible to tell which of the ivory works preserved in the Hōryūji (the temple that is the oldest wooden structure in Japan) and the Shōsōin (the Imperial Treasury in Nara) are of Chinese make and which are of Japanese make.

The technique known as *bachiru* or *hane-bori* (*po-lou* in Chinese) was applied to the making of all sorts of ivory objects. This method consisted of engraving a design on an ivory surface, which had been dyed red or green, in such a way that the carved parts would form a design in the white of the ivory. In some cases the carved design was dyed in another color instead of being left white. This technique was frequently applied to articles made entirely of ivory. Among such ivory works that have come down to us are small cylindrical cases decorated with flower and bird designs, plectrums for the *biwa* (a lutelike instrument), with designs of birds and flowers, landscapes, and animals; rulers

with similar designs; and stones used in the game of *go*, with centered motif of a bird holding a flower in its beak.

There are also examples of ivory carving in the round, such as the holder of a bamboo writing brush and the rollers for a scroll preserved in the Shōsōin. This bamboo brush holder is in the shape of a pagoda, a motif apparently thought appropriate for a brush with which Buddhist scripture would be written. As might be expected, the Chinese custom by which an exalted personage held a *hu* when in ceremonial dress was introduced into Japan, where noblemen carried it on ceremonial occasions. The *shaku*, as the Japanese call this flat ceremonial baton, was sometimes made of ivory. As a rule, the ivory *shaku* bore no decorative design, but the patterned grain of the ivory was often used to advantage, just as choice grains are turned to account in woodcraft. Ivory and rhinoceros horn were much used for knife handles, and the ivory parts were usually adorned with carving. It was also the custom to decorate boxes, vessels, and furniture with ivory inlays forming designs of straight lines or curves. Sometimes deerhorn was substituted for ivory. Other uses of ivory are indicated by the frames of the stringed instruments treasured at the Shōsōin, which are decorated with arabesque designs of inlaid ivory, shell, or amber, and by the goban, or Japanese chessboards, which are similarly decorated. It is recorded that incense burners made of ivory were used in this period, and it was customary to adorn the back and chest of a horse with some sort of decoration of ivory or horn; quivers were also so decorated. Rhinoceros horn was another prized material; there is a floral-shaped sake cup carved out of rhinoceros horn in the Shōsōin.

The art of ivory carving evidently fell into desuetude in Japan after the 8th century, for delicate works comparable to those preserved in the Shōsōin ceased to be produced. Even in the 15th and 16th centuries, when things Chinese appealed strongly to the Japanese taste, there was no significant ivory production. Toward the 18th century it became the fashion in Japan to wear an inro (lit. "seal box") at the girdle. Originally intended for holding the seal (*in*), the inro actually was used as a medicine holder. As a concomitant of this custom of wearing a girdle pendant there developed the art of the netsuke, a miniature toggle that did duty to anchor the inro (PL. 248). Ivory netsuke were carved with all sorts of motifs, including human figures, birds, animals, plants, insects, and fish. The use of the netsuke was not restricted to the inro, since the tobacco pouch and pipe case were also worn at the girdle and required fasteners. Pipe cases and inro as well were made of ivory. Various materials besides ivory were used for making netsuke, among them deerhorn, whalebone, boar tusk, rhinoceros horn, metal, wood, earthenware, and shell; but ivory was by far the favorite, for it is more amenable to carving, more durable, and more pleasant to the touch than the others. Peculiar to Japan, this appendage of the girdle pendant — the netsuke — occasioned the development of a uniquely Japanese art of elaborately detailed miniature carving on a microscopic scale. Needless to say, netsuke have always captured the fancy of the curio collector; beyond this, though they can hardly be said to be possessed of noble sculptural beauty, they do have a charm of their own, which may be likened to that of the Chinese *tao-ch'iu*.

Chief among the noted carvers of ivory netsuke who flourished before the 20th century were Kaigyokusai (1813–92), famous for his rabbits and mice; Tomotada (mid-18th cent.?), for his fine oxen; Tomochika I (1800–73), for his human figures and skulls; Mondo (1857–1917), for his carvings of Taoist hermits; Mitsuhiro (1810–75), for his human figures, birds, animals, fish, insects, and plants; Minko (1735–1816), for tours de force such as carvings of human figures and animals with movable eyes; and Rantei (late 18th cent.), whose forte was carving animals, birds, and flowers. Among the carvers of deerhorn netsuke was Kokusai (mid-19th cent.); Tomiharu (1723–1811) and Issai (late 18th cent.) were famous as carvers in boar tusk and whalebone, respectively.

In the latter half of the 19th century, when trade with foreign countries began, ivory carvings — chiefly netsuke and dolls — were produced in large numbers for export. The skill of the Japanese artisans, added to the fact that the differential in wage standards made it economically feasible for them to work at a relatively slow pace, enabled them to turn out carefully elaborated ivory works which met with considerable success.

JAINISM. Jain art in general evolved in the same manner as Indian art, but it is imbued with a very different spirit. Early Jain buildings resemble Buddhist structures, and later ones Hindu archictecture, but they reveal characteristic differences of planning and decoration. Although Jain sculptures and paintings are of the same type as Buddhist and Hindu ones, the iconography and psychological approach are different. Buddhist figural art is characterized by a warm humanity and that of the Hindus by dynamism and sensuality, whereas Jain art is cold and intellectual, the result of the Jain doctrine, of the history of the sect, and of the social position ot its members.

SUMMARY. Doctrine (col. 786). History (col. 787). Architecture col. 788). Sculpture (col. 792): *Sculpture before the 4th century; Iconography; Sculpture after the 4th century; Bronzes*. Painting (col. 797). Minor arts (col. 798).

DOCTRINE. The present Jain doctrine was formulated by Vardhāmana (ca. 599–527 or ca. 549–477 B.C.), called Mahāvīra (Great Hero), who was a contemporary of the Buddha. Mahāvīra reformed a religion preached over 200 years earlier by Pārśvanātha, and although he is considered the historic founder of Jainism the Jains themselves regard Mahāvīra as the last in a series of 24 tirthankaras (saviors) or jinas (victors; whence the name Jains, followers, or sons, of the victor). Like early Buddhism, Jainism is an atheistic, rationalistic, ascetic, and anti-Brahmanical doctrine, but with a "scientific" (physical) rather than a psychological emphasis. It interprets the world in terms of soul-monads, several kinds of ether and atoms which can form various compounds. Karma (the effect of action), which Buddhism regarded as a moral force, represents such a "physical" element, attracted by the activity engendered by earlier karma. Thus the circle of life through hells, animal and human existence, and many heavens is kept going from birth to rebirth. But avoiding murder, theft, lies, lewdness, and avarice and by self-discipline, patience, fasting, self-mortification, study, and meditation the influx of further karma can be stopped, and the soul-monad, omniscient and blissful, be freed from the entanglements of matter. As a result of this "physical" interpretation of salvation the Jains have occupied

themselves very much with speculations on the structure of the universe; the number of worlds in the infinity of space; the world axis with Mount Meru in the center of Jambudvīpa (where India is situated); the number and character of the other continents, oceans, heavens and hells, and of their inhabitants; and the number and character of successive world periods in the infinitude of time, oscillating between bad ages in which man has sunk down to the most primitive level and golden ages of a paradisaic life without sorrows and sins. The bad, though not yet the worst, age is believed to have commenced after Mahāvīra's death, with the result that the decline of the true religion has become inevitable, the Jains remaining the last group of "elect ones."

The Jains accept the Hindu gods and goddesses, though under different names, but concede to them only a subordinate role as higher, but not fundamentally different, beings. They also accept the Hindu myths and legends, but give them a rationalistic interpretation. The real objects of veneration are the 24 tirthankaras, the great world teachers. Though the devotees cannot communicate with these blissful monads on the summit of the universe, Iṣatprāgbhāra, the tirthankaras can strengthen the devotees' faith and reduce their karma. The lay devotees aspire merely to a rebirth in a better world; only the monks and nuns try to achieve salvation, sometimes by starving themselves to death.

By the 3d century B.C. the Jain religion had split up into two sects: the more rigorous Digambaras ("clothed in space," i.e., nude) and the moderate Śvetāmbaras ("clothed in white"). The Digambaras, who once predominated in the south, originally went about completely naked as did Mahāvīra, regard the original scriptures as lost, and differ in many details of ritual, monastic rules, and iconography from the Śvetāmbaras. The Śvetāmbaras, found mainly in the north, at present are more numerous and influential.

HISTORY. The Jains were originally one of the many ascetic sects of eastern India. The order never was strong, nor did its doctrine appeal to the emotional masses. But it found a lay following among the more sober-minded educated classes, especially merchants, bankers, administrators, army officers, and scholars. These gave rich donations, built beautiful temples and monasteries, and wielded considerable influence, even becoming the dominant political power in many states. Another access of strength came from foreign converts, especially Scythian immigrants, as Jainism did not acknowledge the Hindu caste system, which denied to non-Indians an elevated social status. In consequence, Jainism, although losing influence in its home country, gained strength in all frontier areas, first at Mathura, then in Rajasthan, Gujarat, the Deccan, Mysore, and the south (Tondainad, Tamilnad, the Pandya country, and Kerala). There it played a glorious pioneering role; the rise of local art and literature was more or less its work. Because they were in the minority the Jains generally were in a position similar to that of the Jews in Europe and were periodically exposed to cruel pogroms (their martyrs, tradition relates, suffered mass executions by impalement, on the stake, in boiling cauldrons or oil mills, on red-hot copper sheets), for example, in the Tamil south in the 7th century and under several Chola emperors, in Mysore in the 12th century, and in Gujarat during the reign of the Solanki king Ajayapāla (1174–77). Many Jains later embraced the Saiva or Vaishnava faith; a number of Saiva temples and caves and a few Vaishnava ones belonged to the Jains.

The Jains got along rather well with the Moslems. Though fanatic sultans and governors periodically destroyed the Jain temples and idols, others, more tolerant, were prepared to accept these as memorials of great human teachers, though they took exception to the "indecent" naked statues. They granted lucrative contracts (army provisions and equipment or tax collection) to the great Jain bankers and merchants, were prepared to listen to suave Jain scholars, and permitted the restoration of the mutilated sanctuaries. Especially in the late 16th and early 17th centuries the Jains exercised considerable influenced at the court of the Great Moghuls.

This situation affected the character of later Jain art very much because it engendered a spirit of loving conservation. Temples were carefully rebuilt many times more or less on the original pattern, and damaged sculptures were replaced by new ones. Copies of illuminated manuscripts were distributed to distant temples and monasteries, which were provided with underground "bunkers" and secret vaults. Even today the ancient treasures of Jain art are the best protected in India, the most important collections being kept in huge steel safes. For this reason Jain art could preserve the medieval tradition intact despite the cataclysm of the Moslem invasions; furthermore, the late medieval Hindu temple style both in the north and in the Deccan, the architecture of the Gujarat sultanate, and finally early Rajput painting were inspired by it to a considerable degree. But because of the fairly good relations with the Moslems Islamic art infiltrated to some degree.

ARCHITECTURE. Very little early Jain architecture has been preserved, and it does not differ greatly from Buddhist architecture. Stupas were erected over the ashes of the tirthankaras and Sthaviras (their successors as spiritual leaders). One such stupa still stands on Vipulagiri hill near Rajgir. Remnants of another stupa (of the seventh tirthankara Supārśvanātha, according to the *Tīrthakalpa* of Jinaprabhasūri, A.D. 1333), belonging to the late Śuṅga-Kushan period, have been excavated at Kaṅkālī Tīlā, Mathura. Stupas are pictured on the reliefs of some *āyāgapaṭas* (*āryakapaṭras*, votive tablets) found at the same place and at Maholi ($3^3/_4$ mi. southwest). The great Udayagiri inscription of King Khāravela (1st cent. B.C.) of the Meghavāhana dynasty of Kalinga mentions the erection of a huge Jain temple enclosing a hall of beryl decorated with painted walls and ceilings — probably resembling a Buddhist chaitya hall — on the spot of the present Liṅgarājā temple in Bhuvaneshwar (Orissa). The same king and his family laid out a retreat for Jain arhats (hermits) on the Kumari (now Udayagiri and Khandagiri) hills, $6^1/_4$ mi. northwest. Some of these caves are single cells, others rock-cut copies of whole houses. Except for Khāravela's inscription, we could not attribute these to the Jains for nothing of the decoration reveals their Jain character: the deities depicted are early Hindu, for example, the sun-god Sūrya and the lotus goddess Gaja-Lakṣmī (Padmā-Śrī); the figural reliefs in the Rānī Gumpha have been interpreted by some as scenes from the life of Pārśvanātha and by others as episodes from the popular stories of Vāsavadattā and of Śakuntalā; and the whole building is even thought to have been a theater. The Barabar and Nagarjuni Caves (south of Patna), of the 3d century B.C., cannot be strictly claimed for the Jains, as the Ājīvika monks, to whom they had been donated, had turned, from followers of Mahāvīra's order, into its most bitter opponents. The only other early Jain cave in northern India is the Sonbhandar at Rajgir (Bihar). Excavated by Muni Vairedeva (probably identical with the Śvetāmbara teacher Vajra, d. A.D. 57), this cave has two chambers containing tirthankara images, and was also used as a habitation for monks (*caityavāsa*). Other early Jain caves, of the Śātavāhana, Kshatrapa, and Vākāṭaka periods (1st–4th cent.), are found in Saurashtra (Talaja) and the northern Deccan, for example, Cāmar Leṇā (a few miles northwest of Nasik), at Bhamer (Khandesh), Bhamchandra (25 mi. northwest of Poona, now Saiva), Dharasinva (with a vast vihara hall, 37 mi. north of Sholapur), Nāgarjuna's Koṭrī and Sītā-kī Nahānī at Paithan (on the western flank of Kanhar hill fort) near Pitalkhora, and Ankai Tankai (also on the flank of a hill fort) near Manmad. Except for having occasional jina (tirthankara) images the caves do not differ from their numerous Buddhist counterparts. The only Jain cave temple of the classic Gupta period is No. 20 at Udayagiri (Bhilsa) with a dedication inscription to the tirthankara Pārśvanātha, dated A.D. 426 under Kumāragupta I. In the south proper there are few Jain monuments although Jainism had been the dominant religion during the Samgam (i.e., originally Jain *saṅgha* = order) Age, because most of them were destroyed during the fanatic Saiva revival (6th cent. onward). Here and there rock-cut hermitages, sometimes with Brahmi or Pallava Grantha inscriptions, are found, for example, at Tirumparan-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

kunram and in Ramanathapuram district. Other monuments, such as those at Kuzhithera (Chitral Koyil) in Kerala and Narthamalai in Pudukkottai, were later turned into Saiva temples.

The later Jain cave temples belong to the 7th–10th century. The earliest probably is the small shrine at the foot of a great cliff at Sittanavasal (Pudukkottai), founded by the Pallava king Mahendravarman I (ca. 600–30) before his conversion to Saivism; it is completely covered with beautiful murals (royal portraits, dancers, pond with lotus gatherers, jumping deer, and ascetics). Not much later are the Jain caves (dedicated to Pārśvanātha) at Aihole and No. 4 at Vatapi (mod. Badami). The last group in the Deccan are the five Jain caves (Nos. 30–34) of Ellora. They were begun in the 9th century, probably under the Rashtrakuta king Amoghavarṣa (814–80), a rather weak but highly cultured ruler, who, in contrast to his fanatically Saiva predecessors, was sympathetic to the peaceful Jain tenets; excavation ceased with the fall of the Rashtrakuta empire in 974, but the caves remained in use until the 13th century. Ellora by that time had been superseded as the capital by Manyakheta (Malkhed-Malkair), but, like most ex-capitals it continued to flourish as an industrial and mercantile center, and was dominated by Jain businessmen. The Choṭā (Little) Kailāsa is, as its name implies, a smaller (only one-storied) imitation of the famous great Śiva temple (No. 16, the Kailāsa) standing in a court carved out of the cliffside. The Indra Sabhā, a real cave but preceded by a court with a freestanding rock-cut chapel, and the Jagannātha Sabhā, a pure rock-cut cave, are two-storied, though the lower stories were never completed. The decoration is like that in the Buddhist and Brahmanical caves, but richer and harder; there are some fine images of Pārśvanātha, Gommaṭeśvara (see below), Indra (Kubera), Kuṣmāṇḍinī-Ambikā, etc. (PL. 251). The last Jain caves of the Deccan are near Chandor (dedicated to Candraprabha, 12th cent.). The latest in India are at Gwalior, by the 8th century (under King Ama, 753–60, son of Yaśovarman) a center of Jainism. The caves are situated along the foot of the cliffs of the hill fort. The oldest ones, of the 6th–8th century, are on the west side, outside the entrance to the Arvahi cliffs; those of the 8th–9th century are above the Lower Fort (Bādalgarh); the majority, executed by order of the Jain ministers of the Tomār rajas, especially of Duṅgar Siṅgh (1425–54) and Kīrti Siṅgh (1454–79), are on the southeast and northwest sides and on both ends of the Arvahi cliffs. All of these caves contain chapels with one or several images and reliefs, and sometimes cells for monks. The early sculptures are of high artistic quality (especially the birth of Mahāvīra and a yaksha couple); the late ones are sometimes grandiose and extremely crude (PL. 256).

Numerous Jain idols, in stone and in bronze, which date from the Kushan period (2d cent.) on, exist. Although a sizable number of early Hindu and Buddhist temples constructed in dressed stone are still standing, not a single Jain temple earlier than the 6th or 7th century has survived. This may be because the Jain communities were concentrated in the big cities, which were destroyed many times and thoroughly, and also because the middle class preferred brick construction as it was cheaper, but there is reason to believe that the temples were deliberately destroyed during periods of persecution, since the number of genuine medieval Jain temples preserved is unnaturally low when compared with those mentioned in inscriptions, the ones existing now having been rebuilt or at least heavily restored in the last centuries. The oldest still surviving Jain temples seem to be a ruin on Vaibhara hill near Rajgir, which encloses an apparently contemporaneous later Gupta Pārśvanātha image, and the Odegal Basti (from *vasati*, *vasatikā* = temple) at Sravana Belgola, a triple shrine in the flat-roofed early Gupta style (probably 6th–7th cent.).

The not too numerous genuine medieval Jain temples in the south belong to the Digambara sect, who are believed to have originated there with the immigration of Bhadrabāhu early in the 3d century B.C. Their first settlement was lonely Sravana Belgola in western Mysore (PLS. 252, 253). Its temples on and between two bare rock cones are rather well preserved. On Doddabetta, or Vindhyagiri, hill stands the colossal monolithic statue of Gommaṭeśvara (or Bāhubali, son of the firs tirthankara Ṛṣabhanātha, said to have renounced the world after a bitter struggle for empire with his brother Bharateśvara), carved ca. 983 under Cāmuṇḍarāya, regent for the Ganga king Rācamalla III; around its fortified enclosure (containing a set of excellent tirthankara images) are the already mentioned Odegal Basti and two small shrines of the Vijayanagar period. On Chikkabetta, or Chandragiri, hill are the majority of temples: the Candraprabha Basti (8th cent.); the important Cāmuṇḍarāya Basti (A.D. 995), erected by Jinadevaṇa, the son of Cāmuṇḍarāya; the Kattale (1118), Śāsana (1117–18), and Eraḍukatte (1118) *bastis*, erected by Gangarāja, the great general of the Hoysala king Viṣṇuvardhana (1100–52); the beautiful Savatigandhavārana Basti (1123), built by Viṣṇuvardhana's queen Śāntale Devī (the famous temple dancer and musician). In the village are the huge Bhaṇḍāri Basti (1159), built by Hulla, the treasurer of King Narasiṁha I (1152–75), and the Akkana Basti (1181), erected by the wife of a minister of Ballāla II (1172–1220). They belong to the finest examples of Hoysala art. The Meguṭī temple in the fort at Aihole was erected in 634 by Ravikīrti, court poet of the Chalukya king, Pulakeśin II. The temple dedicated to Pārśvanātha at Pattadakal is of the 7th or 8th century. The other temples belong to the 10th–13th century, when the Western Chalukyas, Kadambas, Hoysalas, Yādavas, etc., were struggling for supremacy over the Deccan. Such, for example, are the temples at Aihole south of the town, Halsi, Degamve (Kallagudi Basti, A.D. 1175), Yalavatti, Belgaum (two in the fort, 1205), Anjaneri (near Nasik), Halebid (Pārśvanātha and Śāntinātha *bastis*, 11th cent.), Angadi (11th cent., Mysore), and Lakkundi (1171). Most of them are outside or at the periphery of the town; those that are in or near its center were erected after its reduction to a provincial industrial town.

The only surviving Jain centers of any importance in the Tamil country are Tirumalaipuram (with a 10th-cent. *basti*) and Tiruparuttikunram, a suburb of Kanchi (Conjeevaram), containing the Candraprabha and Vardhamāna (Trikūṭa Basti) temples built by the Chola emperors Rājendra I (ca. 1014–44) and Kulottuṅga I (1070–1120), and added to by Rājarāja III (1216–46), Bukka II (in 1387–88), and Kṛṣna Deva Rāya (in 1518). These temples, in provincial late Pallava style, are remarkable for their unique murals, which date from the 16th–18th century, with fragments from the 14th century.

The temples of the Vijayanagar period, apart from those already mentioned at Sravana Belgola and Tiruparuttikunram, belong mainly to two areas: Vijayanagar proper as well as its successor Penukonda and South Kanara (hinterland of Mangalore). The Vijayanagar (mod. Hampi) temples are the Gaṇigitti Jainanātha Caityālaya, erected in 1385 by Irugappa, general of Harihara II (1347–1404) and his brother Bukka II, who had added the mandapa at Tiruparuttikunram; a *basti* on a hill between the Viṭṭhala temple and Acyuta Rāya's temple; and the group of temples on the Hemakuta, near the Pampāpatī temple, of a very simple style and with few sculptures, almost the only temples in the Deccan of the 14th and 15th centuries. The South Kanara temples, mainly of the 12th–16th century, are of the Kerala-Malabar coastal style, being constructed completely or partly in wood or imitating wood forms in stone. At Mudbidri there are 16 *bastis*, the largest and most notable being the Hosa Basti (1430). There is a Jain temple at Guruvayankeri. Karkal and Venur (Yenur) have colossal statues of Gommaṭeśvara.

There are also few genuine medieval Jain temples in northern India. The earliest are the Mahāvīra and Saccikā Devī temples at Osian (near Jodhpur, erected by Vatsarāja Pratīhāra, ca. 780–800). The next is the Śāntinātha at Deogarh (near Lalitpur with an inscription of 862 by the Pratīhāra king Bhoja I), very archaic, with a pronounced circumambulation passage and an open mandapa; around this are the remains of about thirty other Jain shrines and numerous detached images (8th–13th cent.). Other Jain temples or ruins stand at Gyaraspur (Mālādevī and Bajra Mātā), Un (Goaleśvara, 11th cent.) and Purana Chanderi in Malwa; at Khajuraho (10th–11th cent.) and Mahoba (12th–13th cent.) in Bundelkhand; Amwa near Ajanta (ca. 11th

UP State Museum, Lucknow

cent.); Sirpur (Ṛṣabhanātha, 1412) and Aundha (Nāganātha, 13th cent., now Saiva) in Berar; and Tringalavadi (Ṛṣabhanātha, 1188) near Nasik. The best preserved of all these temples are those at Khajuraho: Pārśvanātha (VII, PL. 472) and Ādinātha, 11th century; here also is the Ghantai, a fine mandapa ruin. The earliest Indo-Islamic mosques, the Quwwat-ul-Islām at Lalkot (Delhi) and the Arhai-dīn-kā-Jhonpṛa at Ajmer, are simply remodeled Jain temples, for the arcaded courts of these temples could easily be transformed as desired.

The center of Jain art was and still is Gujarat and Rajasthan, especially Marwar, Mewar, Jaisalmer, and Bikaner. Here the number of temples is legion, and the wealth of their decoration simply overwhelming. This is the result of the great influence which Jain ministers and generals exercised under the Solanki (or Chaulukya, ca. 961–1244) and Vāghelā dynasties of Gujarat (ca. 1222–98), because Kumārapāla (1143–73), the founder of the younger branch of the Solankis, and then Lavaṇaprasāda and Vīradhavala, the first Vāghelās, had been placed on the throne with the help of the Jains. As the Solanki empire expanded over southern Rajasthan, Jain art spread over that whole area. Most important are Anhilwara (mod. Patan), Dholka, Pawagarh, Taranga Hill, and Mount Abu (Dilwara and Achalgarh; PL. 254) in Gujarat; Satrunjaya near Palitana (PL. 257) and Girnar near Junagarh in Saurashtra; Bhadreshwar (Vasai), Devakota, and Sambhavanatha in Cutch; Hathundi, Jalor, Kekind, Kumbharia, Mandor, Nadlai, Nadol, Pali, Phalodi, and Pindwara in Marwar; and Bijolia, Chitorgarh, and Nagda in Mewar. The principal builders were Vimala Shā (prime minister of the Solanki ruler Bhīma I, 1022–64), who founded the great temple groups of Dilwara, Kumbharia, and Satrunjaya; Kumārapāla, who built at Chitorgarh, Achalgarh, Girnar, Jalor, Taranga Hill, Devakota, etc.; and Vastupāla and Tejapāla [mighty ministers of the last Solanki ruler Bhīma II Bholo (the Simpleton)], who built at Dilwara, Satrunjaya, Girnar, Sambhavanatha, Sanchor, etc. All these rulers and ministers were shrewd enough not to neglect the temples of the Hindu masses, just as tolerant Hindu rulers made, or at least confirmed, donations to Jain sanctuaries. Some of these temples are in ruins; others have been restored, enlarged, and embellished many times, beginning in the 14th century, but especially in the 15th to the early 17th century (ascendency of the Rajput federation from Rana Kumbha to Sangrām; tolerant rule of the Moghul emperors Akbar and Jahāngīr), and again in the 18th and 19th centuries.

Most of these reconstructions and numerous new temple foundations (e.g., the famous Caumukh temple at Ranakpur, 1440) were due to the munificence of the Jain ministers of the various Rajput maharajas, especially the Jain pattidars (holders of trade monopolies). In the 19th century the role of patron was taken over by the big Jain bankers and millowners in Ahmadabad, Bombay, Calcutta, etc. These later temples, often temple cities (for, as in Buddhism, the donation of each temple or image is regarded as a meritorious work contributing to salvation), spread over northern Rajasthan, first during the 13th and 14th centuries (time of worst Moslem invasions) to Jaisalmer, Lodurva, and Rajgir; in the 15th to Bikaner; in the 16th to Amber, Sanganer, Bairat, Sikar, etc.; in the 18th and early 19th centuries to central India (Sonagiri or Sonagarh, near Datia; Mau Ranipur), then Bihar (Rajgir; Mount Parasnath or Sammeta-Sikhara, near Hazaribagh), Berar (Muktagiri, near Ellichpur), and finally to modern Delhi (the Chandni Chauk), Ahmadabad (especially the Hāṭhī Siṅgh temple), Indore, Calcutta (garden of Badrīdās), and Bombay.

As the Jain cult adjusted itself to the Hindu ritual in many ways, even to the introduction of temple music, very emotional hymns, and dancing girls, so too did the style of the temple, except in minor details. Even the sculptures and murals on the temple walls and ceilings superficially looked very similar, differing only in the details of their iconography. However, because the Jains were an often-disliked minority amid the Hindus and Moslems, because fundamentally all tirthankaras were equally venerated, and because among the Śvetāmbaras the lay congregation had an active share in the cult, certain special features, with a special terminology, developed. Most Jain temples (*basti*) stand in the midst of a closed court (*bhamti, bhamli*) surrounded by a covered arcade, behind which are arranged chapels (*khuntā-re-mandir, devakulikā*) — often topped by their own shikaras — for all the tirthankaras, and sometimes also for minor deities, and cells for the resident monks (*caitya-vāsin*). In other cases (e.g., at Ranakpur) large subsidiary shrines (*madar*) or niches (*gokhala*) are grouped around the sanctuary (*mūlagarbhāro gambhara*) with its altar (*śaluṅkhā*). Detached minor temples have a circumambulation passage (*bhrama*) around the sanctuary, closed, as the mandapa often is, by a stone screen (*pinjrā*). In the temples of Gujarat and Rajasthan the hall (*sabhāmaṇḍapa, cāvaḍā, cāvaḍī, cauṛī*) in front of or around the sanctuary fills most of the court; at Ranakpur it is two to three stories high. In the court or in front of the temple there stands a flagpole (*mānastambha*), or sometimes a slim tower, such as the one at Chitorgarh (PL. 255), erected by Allata in 895 according to an inscription which is now lost, but in any case dating before 1100. A special type of temple is the *caturmukha* (*caumukh*). The center of this temple is occupied by a symbolic world mountain (Meru) around which are grouped four tirthankara images (*samavasaraṇa*), with four corresponding sanctuary doors, mandapas, and temple entrances. Variations of *samavasaraṇas* are Mount Parasnath, on which 20 of the 24 tirthankaras are believed to have died, and Nandīśvaradvīpa, one of the mythical continents of the central world, a kind of earthly paradise.

The north Indian Jains have diligently preserved the medieval temple style up to the present day. However, Islamic influences began to infiltrate in the late 15th century, especially in the ornamentation, and during the Moghul period contemporary Islamic forms — pillars, niches, and domes — were taken over. Many temples of the 18th and early 19th centuries, for example, those at Mau Ranipur, Sonagiri, Muktagiri, and Merta, are built in the late Rajput-Moghul style. Finally, even Victorian European art was adapted, with an emphasis on mirrors, mirror mosaics, chandeliers, and sentimental female statues, as exemplified in the Jain temples of the Badrīdās at Calcutta.

SCULPTURE. *Sculpture before the 4th century.* Jain tradition, according to the *Vasudevahiṇḍī*, written before 610, and the *Āvaśyakacūṛṇi*, 733, claims that an image of Mahāvīra (as Jivantasvamin, i.e., as prince before his renunciation) had been made while he was alive. This image was first in the possession of King Udayana of Vitabhaya-Patan, then of King Pradyota of Ujjain; later it was installed at Dasapura (Mandasor) and, according to Hemacandra, taken by Kumārapāla and placed in a temple at Anahillapattana. The earliest extant images, which may date from Maurya times (Patna, Mus.), are from Lohanipur; they are amazingly similar to the well-known protohistoric statuette from Harappa. Next come the Pārśvanātha bronze (Bombay, Prince of Wales Mus.) and the bronzes from Chausa (Patna, Mus.); see *Bronzes*. Jain reliefs first turn up at Mathura (Kaṅkālī Tīlā and Maholi). The earliest ones (1st cent.) are gateway (torana) reliefs from the stupa of Supārśvanātha and votive reliefs (*āyāgapaṭas*) decorated with a stupa venerated by godlings, or with *triratna* (*nandyāvartana*) symbols (of Harappan type) enclosing a tirthankara image (PL. 258). In the Kushan period the Jain iconography began to evolve, although it was still hardly distinguishable from the Buddhist one, and it was in the Gupta period (4th–7th cent.) that it first assumed its characteristic form.

Iconography. The central figures are always the tirthankaras in samadhi, represented either in a rigid standing posture (*kāyotsarga*) or in yogasana. These images, whose features are completely conventional, are characterized by a jewel (*cintāmaṇi*) on their chest and a Wheel of the Law (*dharmacakra*) on their throne. Traits by which the tirthankaras are distinguished are skin color, a tree (*dīkṣāvṛkṣa*) under which they are sometimes sitting, male and female tutelary deities (yaksha and yakshini; Skr., *yakṣa, yakṣinī*), and an animal on each side of the throne. These emblems reveal a close relationship to early Buddhist iconography: the Bo tree (*bodhidruma*), the snake demon Vāsuki, the *dharmacakra*, and the flanking lions or deer.

793

The yakshas were often depicted on the railing pillars of Buddhist stupas or, in the form of Pāñcika and Hāritī, were venerated as protective deities converted to Buddhism. After the Council of Valabhi in 453 the iconography of the Digambara and Śvetāmbara sects began to bifurcate. In the 8th century a bloody fight took place between the two sects for the possession of the temples on Mount Girnar; King Āma of Gwalior intervened and decided in favor of the Śvetāmbaras. It was then that the tirthankara images began to be represented differently, those of the Digambaras showing the virile member, those of the Śvetāmbaras covered by a loin cloth (in the early images; later, this part of the body was often hidden by folded hands). The iconographic scheme is shown in the table on cols. 795–796 (D = Digambara, S = Śvetāmbara). From the point of view of religious history the yaksha and yakshini figures are the most interesting, because here we find many Hindu deities and some late Buddhist ones still in their original, or at least in a transitional, form before their integration into the later orthodox pantheons.

Most of the tirthankaras and yakshas are represented only in the complete series, either in friezes or in the series of chapels surrounding the temple courts. However, some have been especially venerated, with temples and individual images dedicated to them. In order of importance they are the tirthankaras Pārśvanātha, Mahāvīra, Ādinātha, Śāntinātha, Neminātha, Mallinātha, Candraprabha, and Supārśvanātha; the yakshas Gomukha, Brahmeśvara, and Pārśvayakṣa; and the yakshinis Ambikā, Cakreśvarī, Padmāvatī, and Mānasī. Ambikā (gold) is very popular and is shown as a mother goddess, sitting on a lion, a child on her lap and surrounded by children; Cakreśvarī (red), attended by Garuḍa, holds two disks (*cakras*); Padmāvatī, with a swan (*haṃsa*), holds lotuses. The jina whom they attend is then represented on top of their heads, as in Buddhism the Dhyani Buddha is depicted on or in the crown of the bodhisattva.

The Jain pantheon is not limited to these divinities. There are other blessed souls (siddhas), that is, the future tirthankaras, who are already saints; those who have attained enlightenment (arhats); teachers (*ācāryas*); universal monarchs (chakravartins), and the many categories of deities, such as the Nārāyaṇas or Vāsudevas, Baladevas, Manus, Rudras, Kāmadevas, Vyantara-Devas, Vaimānika-Devas, Vidyā-Devīs, Śāsana Devatās, and Dikpālas or Kṣetrapālas. But only a few of these are depicted in the art of the Jains. The Vidyā-Devīs, who are the goddesses of learning and are a special group of yakshis, are shown as Rohiṇī, Prajñaptī, Vajraśṛṅkhalā, Kuliśāṅkuśā, Cakreśvarī, Naradattā, Kālī, Mahākālī, Gaurī, Gāndhārī, Sarvāstramahājvalā, Mānavi, Vairoṭyā, Acchhuptā, Mānasī, Mahāmānasikā, and Sarasvatī (the Hindu goddess of learning, who in Jain art is the messenger of the tirthankaras = *śāsana-devī*). Also depicted, mainly in early Jain art, is the ram- or horse-headed yaksha Naigameṣa or Harinegameṣin; according to legend, this yaksha, who originally did harm to children, transferred the embryo of Mahāvira from the womb of the Brahman lady Devānandā to that of Queen Triśalā and thus became the patron of expectant mothers and of children. There are cycles of reliefs and miniatures which depict the legends of Ṛṣabhanātha (and Gommaṭeśvara), Neminātha (especially the wedding from which he fled at the last moment to become an ascetic), Pārśvanātha, and Mahāvīra.

An important place in Jain iconography is occupied by the *samavasaraṇas*, halls built by the gods where each tirthankara delivered his first sermon, actually models of a mountain city enclosed by three ramparts; the *aṣṭāpadas*, the mountain rising in eight terraces on which Ṛṣabhanātha died, identified with Mount Parasnath in Bihar; and the five Merus, the central mountains of the five continents. These all seem to be iconographic substitutes for the stupas when the latter went out of fashion. There are also *kalpavṛkṣas* or *kalpatarus*, wish-fulfilling trees of paradise (X, PL. 247), and *dīkṣavṛkṣas*, initiation trees of the tirthankaras; world diagrams; representations of Nandīśvaradvīpa, the earthly paradise where even slack devotees have a chance of being reborn; *jinapaṭas*, a kind of Jain mandala, showing the tirthankara enthroned in a temple, surrounded by his *samavasaraṇa*, yaksha, yakshi, principal apostles, and auspicious symbols; and *yantras*, called *siddhacakras* or *navadevatās*, that is, the "Nine Divinities," consisting of the "Five Supreme Ones" (arhat, siddha, *ācārya*, and *upādhyāya*, and sadhu) and the "Four Essentials" (right knowledge, faith, conduct, and penance); and the "Eight Auspicious Symbols" (*aṣṭamaṅgala*), that is, swastika, *śrīvatsa*, *nandyāvartana*, *varddhamānaka* (powder flask), *bhadrāsana* (throne), *kalaśa* (vase), *darpaṇa* (mirror), and *matsya-yugma* (pair of fishes).

Sculpture after the 4th century. The characteristic cult image developed in the Gupta period (4th–7th cent.). In the center was the tirthankara, standing, or in yogasana, on a lotus or a lion throne (*siṃhāsana*), surrounded by a halo (*prabhāvalī*) that was often combined with the back of a throne; at his feet on both sides the attending yaksha and yakshi; on the pedestal the *dharmacakra* and other symbols; and finally, the *dīkṣāvṛkṣa* with adoring deities on each side. By the 6th or 7th century other subjects appeared, such as individual images of yakshas and yakshinis, especially of Ambikā and Sarasvatī, or three tirthankaras were combined into one (*tritīrthikamūrti*). By the late 8th century the style of Jain sculpture had approached other Indian styles, and temple walls were covered with statues and reliefs of yakshas, yakshis, and many classes of gods and goddesses, the only difference being that the sanctuary and the principal wall niches were reserved for the tirthankaras. In succeeding centuries the goddesses (especially Cakreśvarī, Padmāvatī, and the Vidyā-Devīs) became increasingly important, as did various symbols, *yantras*, etc., and especially the *samavarasaṇa*. Jain sculpture is found scattered over the whole of India, from the eastern Punjab (Ketas) to Bengal (Burdwan, Bahulara, Bankura, Mahasthan, etc.), from the Himalaya (Kangra, Baijnath) to the southern tip of India (Kalugumalai, Tiruchchanattamalai, etc.), and in areas where not a single Jain temple has survived (or at least the sparse remnants have not yet been explored).

From about the 11th century the comprehensive relief cycles of the legends of the most famous tirthankaras began to appear, followed by representations of Nandīśvaradvīpa, and then statues of the donors of the temples (from small reliefs with sitting or kneeling figures to life-size statues on elephant back). This growing typological wealth went hand in hand with the progressing exuberance of medieval decoration, when the walls, columns, lintels, doors, and ceilings of every temple were covered with hundreds, and even thousands, of elegant sculptures, at first large in size and later almost diminutive. The ideal type of most of these figures does not differ from the all-Indian one, including the voluptuous bodies of the goddesses, though the overwhelming sexuality of Hindu sculpture is absent.

In the Islamic period the character of Jain sculpture changed. It now definitively became a hieratic tradition. By the 14th century the figures had lost all proportion, in the 15th century they degenerated into lifeless, though still vivid, images, and in the 17th into clumsy and grotesque dolls. During this last phase it was the fashion to give the eyes of the statues corneas of silver, glass, or jewels, which made them protrude like frogs' eyes. This degeneration was to some degree stemmed by the influence of Moghul and Rajput art (see MOGHUL SCHOOL; RAJPUT SCHOOL). This influence is shown in the contemporaneous costumes of the minor deities and secular figures, especially the minor goddesses dressed like dancing girls. In many temples in Rajasthan the Moghul-Rajput style of decorative reliefs superseded the traditional type, often with very happy results. The latter type is also found in the numerous wooden temples of Gujarat and southern Rajasthan (e.g., Anhilwara, Ahmadabad, Baroda, and Dabhoi), inspired by contemporaneous residential architecture; Gujrati and even Marāṭhā costumes are depicted in the reliefs.

Bronzes. Jain bronzes constitute a most important part of the sculpture (PL. 258). These bronzes represent the "good works" of the Jain lower middle class, votives of monks and nuns, artisans, small merchants, etc. In most cases they have an inscription on the back, mentioning the donor and consecrating priest, the date of consecration, and the temple to which they were donated. The donors are often represented on the pedestal as diminutive conventional figures. Many bronzes were house images, and were placed in small cupboard-like

shrines of wood or brass. The shape of the pedestal is similar to other Indian and early Chinese Buddhist bronzes. The yakshas sit on lotuses that swing out from the pedestal. Other bronzes form part of the ritualistic equipment, such as incense burners and statuettes of girls swinging fly whisks (*cāmaradhāriṇī* or chowry bearers) or holding one or several oil lamps (*dīpalakṣmī*) either in their hands or on lotus stalks.

The earliest bronze, a Pārśvanātha figure in Bombay (Prince of Wales Mus.; ca. 1st cent. B.C.), reminds us, by its technique, of the dancing girl figurine from Mohenjo-daro. The Chausa tirthankaras (Patna, Mus.) are of a weird naturalism. A *dharmacakra* from Chausa can stand comparison with the Amaravati reliefs. The apogee of this art was reached during the Gupta period, thanks to a remarkable founding technique in cire-perdue, with which the artisans could master the most complicated forms, modeled very sensitively and inlaid (especially the eyes and ornaments) with gold, silver, and copper. In the subsequent half millennium the composition became richer and richer (*aṣṭatritīrthikamūrti*, *caturvimśatipaṭa*, i.e., all the 24 jinas, *caturmukha*), the number of subsidiary figures increased, and the throne backs were filled with godlings and goddesses; however, the modeling was conventional and heavy. In 7th-century Marwar and northern Gujarat we find short figures with Mongoloid features (Hun settlers?) and ponies. Between the late 8th and early 10th centuries the "baroque" style reached its zenith. The quality of the bronzes was maintained until the 12th century, when they became crude; the inlaid silver eyes, for example, became mere rectangles. Here also the Rajput folk style exercised a beneficent influence, resulting, in the 16th–18th century, in a renascence that was charming though rather "primitive" (mainly chowry bearers, *dīpalakṣmīs*, etc.), but which ended, in the 19th century, in a philistine naturalism. The most important hoards of Gupta and early medieval Jain bronzes were discovered at Akota (Baroda), Vasantgarh (Pindwara in Marwar), Lilva-Deva (Panch Mahals), and Rajnapur-Khinkhini (Madhya Pradesh). The few known Jain bronzes from south India are no more than iconographic varieties of the dominating Saiva types.

PAINTING. Although murals are mentioned in Khāravela's Udayāgiri inscription (1st cent. B.C.), no vestiges earlier than the 7th century are extant. To the beginning of that century belong the exquisite wall paintings in the small cave temple of Sittanavasal (Pudukkottai); apart from diminutive figures of squatting ascetics in the continuous ceiling ornament (a repair of the 9th cent.) they are purely secular. The fragments of ceiling paintings at Ellora (ca. 900–1100), Tirumalaipuram (10th and 14th cent.), and Tiruparuttikunram (earlier series 14th cent.) depict scenes from the legend of Pārśvanātha, yakshas, yakshis, and venerating godlings. The long series of friezes in the Vardhamāna temple at Tiruparuttikunram depict the legends of Ṛṣabhanātha, Mahāvīra, Neminātha and his cousin Kṛṣṇa, and the Brahman lady Agnilā transformed into the yakshini Ambikā or Dharmadevī. Here are represented a variety of styles; the oldest, of the 16th century, recall the paintings at Lepakshi (see ANDHRA; DRAVIDIAN ART); the latest, of the 19th century, are similar to paintings found at Madura and Travancore. At present the only known illustrated south Indian Jain manuscript is the *Śaṭkhaṇḍāgama*, ca. 1113–20, from Mudbidri.

In northern India no Jain paintings before the 11th century have been preserved. But there do exist an uninterrupted series of illustrated manuscripts (until the 13th cent. generally on palm leaves, thereafter on paper) from the time of the Solanki dynasty up to the present day, a number of painted wooden book covers, and a few large pictures on cloth. The majority of these works come from Gujarat, a smaller number from southern Rajasthan, and a few from Jaunpur in Uttar Pradesh, Palam near Delhi, and Mandu in Malwa. These manuscripts were carefully preserved in the bhandars (monastery libraries) of Ahmadabad, Baroda, Anhilwara, Cambay, Chani, etc., and particularly Jaisalmer. Jain manuscripts, especially of the *Kalpasūtra* and *Kālakācāryakathā*, have found their way into some Occidental museums. The *Kalpasūtra* is a handbook of disciplinary rules and is indispensable in every monastery (*upāśraya*); it is illustrated with scenes from the legend of Mahāvīra: his descent from heaven, conception in the womb of the Brahman lady Devānandā, transfer to Queen Triśalā, life as prince, renunciation of the world, terrible self-mortification, and sermon as world teacher in the *samavasaraṇa*. The *Kālakācāryakathā* is a Jain counterpart to the Book of Esther; it relates how the barbarian king Gardabhilla abducted a Jain nun and how her brother Kālakācārya went to the Scythian barbarians (Śakas) and induced them to invade India and to overthrow the tyrant. It is interesting to observe that the Scythian friends of the Jains are always depicted as contemporary Moslems. These two texts were diffused only late in the 13th century, about the time when Gujarat was conquered by the Moslems. The manuscripts of the pre-Moslem centuries deal with different texts, hagiographies, commentaries, etc., such as the *Jñātasūtra*, *Mahāvīracarita*, *Subāhukathā*, *Oghaniryukti*, *Daśavaikālikalaghuvṛtti*, *Niśīthacūrṇi*, and *Sāvagapaḍikammanasuttacuṇṇī*. Historical pictures and portraits of this time exist, among which are portraits of King Jayasimha Siddharājā, King Kumārapāla, the great scholar and missionary Hemacandra, and Jinadattasūri; and there is a representation of the disputation in 1126 between Devasūri and the Digaṃbara Kumudacandra who had come from the Carnatic. Beginning in the 15th century there was a revival of original painting, illustrating secular or Hindu texts such as the *Vasantavilāsa*, *Bālagopālastūti*, *Devīmāhātmya*, *Ratirahasya*, and *Kumārasaṃbhava*; though this type of painting had originally been done by the Jains, it seems that they soon gave it up when it was taken over by the Hindus. Jain art and doctrine had become set and orthodox, but now the spell of ossification was broken, new subjects were taken up (e.g., the *Supārśvanāthacarita*, *Uttarādhyayanasūtra*), and secular subjects, such as dancing girls, were introduced. The late 16th century saw the introduction of a new realism: secular subjects were treated in, for instance, the *vijñaptipaṭras* (official invitation scrolls addressed to famous *ācāryas*), and ancient legends were put into a contemporaneous setting (e.g., the *Kālakācāryakathā*, *Sālibhadramahāmunicarita*).

Jain painting during the reign of the Solankis, Vāghelās, and Paramāras (later Ellora murals) followed the general medieval tradition, especially the "School of the Ancient West." Though the typology and formal canon were derived from the classical Gupta tradition, the spirit which animated it had turned into its very opposite. This painting was characterized by vivid but hard outline, a rather crude realism, no modeling, no space, only the slightest indication of scenery and background, and bright, simple colors, especially red or yellow backgrounds. During the early Islamic period this primitive style became completely ossified, and the scenes were reduced to conventionalized ornaments, farther from naturalism than even Byzantine icons. Heads seen from the front are globes; in profile, they resemble birds' heads, with beaklike noses and eyes projecting like daggers. Men have breasts like women; the attendant figures form lateral friezes; the representations of rooms, furniture, etc. are reduced to a top or bottom ornament. But these miniatures do exhibit a great linear beauty, a perfect balance of surfaces, and a simple harmony of bright colors and golden surfaces. When Śakas are depicted, they appear to have been copied from Islamic prototypes of the Abbasside-Seljuk, later of the Timurid (Herat), school. The Rajasthan variety of the style is simpler than that of Gujarat. In the 15th century this style began to disintegrate, the figures were freely handled like shadow-play dolls, new compositions were tried out, and Islamic scenes and ornaments were introduced. An especially ostentatious and ponderous style developed in Jaunpur, a very simple one in Mandu. In the 16th century the style was influenced by the early Rajput, in the 17th century the Rajput style became dominant, and finally European elements infiltrated.

MINOR ARTS. The Jains used the same objects and articles as the other Indians, but in the ornamentation introduced their own iconography: figures of the tirthankaras, the *aṣṭamaṅgala*, benedictions, etc. The articles were painted, executed in lacquer, carved, embroidered, etc.

JAPAN. The name Japan is adapted from the Chinese "Jih-pên kuo" ("Land of the Rising Sun"), which Marco Polo made known to Europe in the form of Zipangu (Eng., Cipango). The official name for Japan is Nippon or Nihon, which seems to have come into use in the 7th century B.C. Japan consists of four main islands, Hokkaido, Honshu, Shikoku, and Kyushu, and numerous small islands, covering a total area of 142,338 square miles. It is divided into eight administrative districts: Hokkaido, Tohoku (or Ou), Kanto, Chubu, Kinki, Chugoku, Shikoku, and Kyushu.

SUMMARY. Population and natural surroundings (col. 801). Periods of art history (col. 802): *Pre-Jōmon (prepottery) period; Jōmon period; Yayoi period; Great Burial (or Yamato) period; Asuka period; Nara period; Heian period; Kamakura period; Muromachi period; Momoyama period; Edo period; Meiji-Taisho period; Tendencies of contemporary art.* Kinki district (col. 810): *Historical outline; Regions and centers of artistic interest: a. Prefecture of Nara; b. Prefecture of Kyoto; c. Prefecture of Osaka; d. Prefecture of Shiga; e. Prefecture of Mie; f. Prefecture of Wakayama; g. Prefecture of Hyogo.* Chugoku and Shikoku districts (col. 826): *Historical outline; Regions and centers of artistic interest: a. Prefecture of Tottori; b. Prefecture of Shimane; c. Prefecture of Okayama; d. Prefecture of Hiroshima; e. Prefecture of Yamaguchi; f. Prefecture of Kagawa; g. Prefecture of Kochi; h. Prefecture of Ehime.* Kyushu district (col. 829): *Historical outline; Regions and centers of artistic interest: a. Prefecture of Fukuoka; b. Prefecture of Oita; c. Prefecture of Saga; d. Prefecture of Nagasaki; e. Prefecture of Kumamoto; f. Prefecture of Kagoshima.* Chubu district (col. 832): *Historical outline; Regions and centers of artistic interest: a. Prefecture of Aichi; b. Prefecture of Shizuoka; c. Prefecture of Gifu; d. Prefecture of Nagano; e. Prefecture of Yamanashi; f. Prefecture of Fukui; g. Prefecture of Ishikawa; h. Prefecture of Toyama; i. Prefecture of Niigata.* Kanto district (col. 835): *Historical outline; Regions and centers of artistic interest: a. Prefecture of Kanagawa; b. Tokyo metropolitan area; c. Prefecture of Chiba; d. Prefecture of Saitama; e. Prefecture of Tochigi.* Tohoku district (col. 840): *Historical outline; Regions and centers of artistic interest: a. Prefecture of Fukushima; b. Prefecture of Yamagata; c. Prefecture of Akita; d. Prefecture of Miyagi; e. Prefecture of Iwate; f. Prefecture of Aomori.* Hokkaido district (col. 843): *Historical outline; Regions and centers of artistic interest.*

POPULATION AND NATURAL SURROUNDINGS. The Japanese archipelago is mountainous, with few plains; its coast line is extremely intricate, and its scenery beautiful and rich in variety. The rivers are mostly short and rapid; the longest river, the Shinano, is 230 miles in length.

It has hitherto been held that the aboriginal race of Japan was the Ainu, that later on Mongolians came through Korea into Japan, that there was another invasion of people from the south Pacific, and that these merged to form what is known as the Japanese race. In other words, the people of the Jōmon period belonged to the Pan-Ainu type, and were replaced by races coming from the Asiatic continent (the people who used the Yayoi pottery). The Ainus were driven northward and now survive in part of Hokkaido, while the people from the continent are the ancestors of the present-day Japanese. However, owing to the discovery of skeletons of the people of the Jōmon period in recent excavations, a new theory has been suggested. According to this, the aborigines of Japan were not the Ainus; on the contrary, it was the ancestors of the present-day Japanese who used the Jōmon pottery. The ancestors of the present Ainus occupied only a part of Hokkaido and northeastern Honshu. Their level of living was about the same as that of the Jōmon people, but, in contrast to them, the Ainus did not assimilate the new continental culture, which, represented by the Yayoi pottery, already possessed an advanced knowledge of agriculture (cultivation of rice). The Ainus were thus gradually overpowered by the Japanese, who rapidly absorbed the new culture. If, as it appears, the Japanese race originally migrated from the continent, its original home has still not been ascertained. From the conformation of the skeletons, the indigenous Japanese race shows elements in common with the ethnic type of central to southern China.

Japanese art is closely connected with the climate of the islands, and its constant, fundamental characteristic is a direct communication with natural beauty. The archipelago stretches from the temperate to the subtropical zone and is dominated by high volcanic peaks, which are permanently snow-covered, while the lower mountains and hillsides have lush vegetation. The coast line is deeply indented, and on the small islands that dot the sea around it the reddish hue in the sky contrasts with the rich green of the landscape. Surrounded on all sides by water, the land in wrapped in vapors that change in form according to season and altitude, creating a continual variety of scenic effects.

The climate and the changeable beauty of the landscape have imprinted themselves deeply on all aspects of Japanese art and civilization, not least upon its architecture. Most Japanese buildings are made of wood and harmonize with nature. There are only slight permanent partitions separating the interior from the exterior, such as a row of wood or paper sliding doors. When the doors are opened or removed, the interior of the house is open to the outside world. Even when they are closed, the paintings of landscapes or flowers and birds on the fusuma (sliding doors of wooden framework covered with paper) that separate the rooms suggest natural scenery, as though nature were penetrating in to the houses (see INTERIOR DECORATION AND DESIGN). In obedience to the same principle of communion with nature, gardens too are designed to give an effect of naturalness. The most ancient gardens are miniature reproductions of landscapes. Later, when the development of urban areas diminished the size of gardens, trees and rocks were always arranged so as to suggest a natural landscape; even today, this remains the principal aim of private gardens (see LANDSCAPE ARCHITECTURE).

In sculpture, wood, which is abundant in all the islands, is the material most often used. Except in the Asuka and Nara periods, when Chinese influence was strong, wood sculpture achieved a remarkable development. There are few sculptures in stone, because stone is a material that is rare in Japan.

The influence of nature is most evident in paintings. Painting in the earlier periods, strongly influenced by Buddhist art originating in India and introduced through central Asia and China, contained many continental elements, but the painting in native Japanese style, which developed in the 10th century, showed a close intimacy with nature. Its subjects were largely derived from the changing aspects of nature throughout the 12 months (*tsukinami-e*, or monthly order painting) and the 4 seasons (*shiki-e*, or four seasons painting). Buddhist painting also began to have backgrounds of Japanese scenery. Landscapes and flowers and birds thus became the main motifs of Japanese art, as they still are. In delineation and coloring, Japanese painting is characterized by an extremely plein-airist manner in which shading is almost entirely absent. This is true of nearly all types of Japanese painting, and is particularly noticeable in the case of Ukiyo-e (q.v.). Impressionist art in Europe was influenced by this manner.

Furniture, clothes, and other works of decorative arts also derive most of their ornamental motifs from plants.

PERIODS OF ART HISTORY. The history of Japanese art and culture is generally classified into the following periods: pre-Jōmon; Jōmon; Yayoi; Great Burial (or Yamato); Asuka: 552–645; Nara: 645–793; Heian: 794–1185; Kamakura: 1185–1333; Muromachi: 1334–1573; Momoyama: 1573–1615; Edo: 1615–1867; Meiji-Taisho: 1868–1926. The Jōmon to Heian periods are called the ancient period; the Kamakura and Muromachi, the medieval period; the Momoyama and Edo periods, the early modern period; and the Meiji and thereafter, the modern period.

Pre-Jōmon (prepottery) period. Discussions of the history of Japanese culture have hitherto begun with the Jōmon period, although some archaeologists believed in the existence of a previous culture. In 1949, however, a few stone implements were excavated in the stratum of volcanic ash deposited during the diluvial epoch at Iwajuku in Gumma prefecture, situated below the stratum containing Jōmon

805

pottery pieces; similar stone implements were discovered in 1951 at Moro in Tokyo, and later more specimens were found in Chubu, Tohoku, Hakkaido, and Chugoku districts. This leads to the inevitable conclusion that a prepottery culture existed in all parts of Japan, but it is not yet possible to ascertain its date and duration. The stratum in which these stone implements were found does not contain any pottery fragments, so ceramics were probably unknown. This period is therefore termed the prepottery period.

Jōmon period. Sites of the Jōmon period exist in large numbers, and the manner of life of the times is relatively well known. Recent carbon 14 tests on wood implements from these sites reveal that the period began several thousand years ago (see II, col. 21). Its end is generally placed in the 5th or 4th century B.C., though there is a considerable discrepancy between the eastern and western parts of Japan.

In contrast to the cultures of later periods, which spread from the western part of the island, the Jōmon culture appears to have had its center in eastern Japan. This hypothesis, however, cannot be clearly demonstrated owing to the lack of material relating to western Japan. What has been verified so far leads to the conclusion that the Jōmon culture extended over nearly all of Japan (PLS. 260, 261; II, 16, 17).

Yayoi period. The Yayoi period was from about the 5th or 4th century B.C. to about the middle of the 3d century of our era. During the Jōmon period hunting and fishing were the means of subsistence; in the Yayoi period agriculture was introduced. The new agricultural culture began in northern Kyushu (the area nearest the Asiatic continent and most open to continental influences) and subsequently made its appearance in the Kinki district, the area around Ise Bay, and the Chubu and Tohoku districts. The earthenware associated with the new culture was either shaped by hand or made by coiling (preparing the paste in the shape of rope and coiling it upward to fashion the rough shape) and was finished on the surface with a combing tool. Its body is thinner than the Jōmon type, its forms more regular, and its firing higher (probably at 600°C–800°C). This earthenware is called Yayoi pottery, because the first specimen was unearthed on Yayoi St. in Tokyo (II, PLS. 16, 17; III, PL. 171).

Owing to the necessities of rural life, dwellings of this period were nearly always located in the plains. The houses seem to have been most elaborately built, usually of rectangular or oval ground plan, with rounded corners.

The use of metal and the art of weaving already existed in the early part of this period. Metal objects were either of iron or bronze; notable among the bronze articles are swords, spears, halberds, mirrors, and *dōtaku* (II, PL. 17). The *dōtaku* are bell-shaped objects, the origin and purpose of which are not known; they were perhaps derived from the *pien chung* (flattened bell) of China or similar bronze bells from Korea. The swords, spears, halberds with long, narrow blades, and the mirrors of the early Han period were imported from the continent into northern Kyushu and later imitated in Japan. In time the weapons lost their functional value and were transformed into ritual objects with wide, flat blades. The swords, spears, and other bronze implements are chiefly found in northern Kyushu; the *dōtaku* in the Kinki and neighboring districts.

Great Burial (or Yamato) period. This denotes the period from about the second half of the 3d century to the introduction of Buddhism in the mid-6th century. In this period agricultural life spread to the greater part of the land, and the economic improvement that resulted was the first impulse toward the formation of an embryonic nation. The Yamato clan became powerful in the 3d–4th century in Yamato province, in Kinki district, and gradually engulfed both neighboring and more distant communities and brought the land under a single control. The clan was overlord to all the local powers, and the rulers of the merged clans also began to enjoy a prosperity far above that of the rural population they controlled. The burial mounds, or tumuli, were the tombs of the clan leaders.

Since the culture of this period is represented only by the tumuli and the funeral offerings found in them, the life of the lower class is almost unknown, but probably it was not much different from that in the Yayoi period. The houses of the ruling class were more advanced, consisting of a wooden superstructure covered by a roof; some houses had low floors, and some were built on tall pillars with raised floors. There were three types of roof: the *kirizuma*, or gabled roof; the *shichū*, or hipped roof; and the *irimoya*, a combination of hipped and gabled roof, with the gabled roof placed on top of the hipped roof. Some of the houses seem to have been similar to modern Japanese farmhouses.

During this period there was a remarkable development in iron weapons such as swords, spears, and arrowheads; undoubtedly this was instrumental in establishing the hegemony of the Yamato clan. In the late 4th century the power of this clan extended as far as southern Korea, and the relations with Korea resulted in remarkable cultural advances in the Yamato plain. Continental influence began to be manifested in local clans as well. The clan leaders, who had previously been little more than officiating priests, now began to have administrative power. In addition to bronze mirrors and beads of various types made of jade, nephrite, and crystal, which were regarded as "divine treasures," gold and silver now began to be used in various decorative arts. A new kind of pottery known as "Sue ware" began to be made at this time; it had been introduced by Chinese and Korean craftsmen. It was made on the potter's wheel and fired in a climbing-passage kiln at about 1000°C.

Another important type of artifact in this period was the *haniwa*, terra-cotta tomb figures or cylinders placed on or around the tumulus (PL. 261). Whether or not the *haniwa* had any connection with the Chinese funerary figures, which were placed inside the burial chamber, is still an open question. Like the prehistoric earthenware, the *haniwa* were made by the coiling method and were of two kinds: one shaped like a barrel or cylinder, which was set around the base of the tumulus to prevent the soil from washing away, and the other modeled in the shape of humans, animals, houses, etc., which was placed on top of the mound. The latter type give important information about the material culture of the times.

Asuka period. Asuka is the name of a district within which the capitals (which changed on the death of each emperor) were located; the Asuka period began with the introduction of Buddhism in 552 and ended with the Taikwa Reforms of 645–46. After King Syongmyong of Paekche in Korea presented Buddhist icons and ritual objects to the Japanese imperial court, there was a serious conflict in Japan between those who accepted Buddhism and those who rejected it. Finally Buddhism triumphed and, under the patronage of the pious prince Shōtoku Taishi (572–621), developed rapidly. In the following centuries the development of Japanese art was closely related to Buddhism, which revolutionized both technically and stylistically all the arts that came in contact with it. The art of this period was inspired by Chinese art of the Six Dynasties period, particularly of the Northern Wei dynasty, introduced through the Korean peninsula.

Nara period. T'ang China in this epoch was extremely powerful and its cultural life was brilliant. Japan repeatedly sent imperial envoys to China, and as a result of its influence the golden age of Buddhist culture began in Japan. The country became more prosperous and powerful and Buddhism, protected by the government, flourished. In the middle part of this period, an imperial edict was issued by the emperor Shōmu (701–56) that a Kokubunji (provincial monastery) and a Kokubunniji (provincial convent) should be built in each province throughout the country. As a result, local districts, which had previously had little access to Buddhist culture, now possessed Buddhist temples and statues. Remains of these temples exist all over Japan except in Iwate prefecture and the northern part of Tohoku district.

The wall paintings in the Kondō (main hall) of the Hōryūji in Nara are monumental works of art of the early part of this period. They contain many Indian elements, proving that Japanese art of the time had an international basis. The Yakushiji, Tōshōdaiji, Shin-Yakushiji, and other temples were built in Nara at this time, and contain numerous fine statues of bronze, clay, wood, and dry lacquer (made of many layers of hemp cloth cemented with lacquer). The most notable monuments of this golden age are the Rushana Butsu (Vairocana) statue and the Shōsōin (treasury), both at the Tōdaiji.

Heian period. This period takes its name from Heian (mod. Kyoto), which in 794 became the new capital. The first 100 years of this period are called the early Heian or the Jōgan period. The influence of T'ang culture still continued in this period, but Buddhism and the Buddhist arts began to assume a different aspect. The Buddhist sects that had flourished in Nara under national protection began to degenerate, while the new esoteric sects, brought back from China by the priests Saichō (also called Dengyō Daishi, 767–822) and Kūkai (Kōbō Daishi, 774–835), won wide favor.

Realizing that the secular life was a bad influence on the Buddhist priests in Nara, the new sects built their monasteries on the mountains, and thus the layouts of the temple buildings became irregular and intricate. From this period are the main hall and the five-storied pagoda of the Muroji, Murō, in Kinki district, which illustrate perfectly the aspect of "mountain Buddhism." The grace and elegance of the painted and sculptured images was replaced by a stern, mysterious aspect. Wood came to be used almost exclusively in Buddhist sculpture, gradually replacing the dry lacquer and clay of the Nara period. It was also in this period that Shintoism (q.v.),

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

under the influence of Buddhist sculpture, began to produce sculptured icons.

The late Heian period, from 895 to 1185, is also called the Fujiwara period, because the Fujiwara family became very powerful at court. In this period the emperor ceased sending envoys to China, and Japanese art began to assert its native grace, with particular attention to beauty and elegance of expression; many of the traditions of art born in this period are still alive today. The artistic center of the country was Kyoto, but about the 12th century the influence of Fujiwara art began to spread to other regions. The Chūsonji in Iwate prefecture, the Shiramizu Amidadō in Fukushima, and the Fukiji in Oita are examples of the metropolitan culture transplanted to remote localities.

Kamakura period. The Kamakura period was an age of warriors. In the arts the emphasis was turned from dilettantism to simplicity, soundness, and vigor. The first indication of the new spirit appeared in the reconstruction of the Tōdaiji and the Kōfukuji in Nara, which had been burned during the civil wars of the 12th century. Unkei, Kaikei (qq.v.), and other noted sculptors produced some of their finest works for these temples. The Tenjikuyō or "Indian" style, which was in fact a style imported from southern China, was employed in reconstructing the Tōdaiji; it is a powerful, solid, and bold style.

Traditional Buddhism had previously been practiced almost exclusively by the upper classes; in this period many new sects directed to the masses made their appearance. As Buddhism became widely diffused, numerous paintings of Buddhist deities and scroll paintings illustrating stories concerning the origins and histories of temples or describing the deeds of the founders of the sects were produced. Zen, or Meditative, Buddhism was also introduced at this time from China. The new sect found great favor among the warriors because of its simplicity and emphasis on contemplation and self-discipline. The high priests of Zen were portrayed both in painting and sculpture. Previously, real persons had rarely been depicted; what had been called portraits were mostly imaginative, stylized, or symbolic images, but the Zen portraits were real likenesses, executed during the subjects' lifetime or soon after their death. Chinese art of the Sung dynasty was the model for Japanese art not only in architecture but also in sculpture, painting, and the minor arts.

Although the political center was Kamakura, the cultural center was still Kyoto. However, from the earliest part of the period many Zen monasteries were built in Kamakura, and the city, no longer a distant corner of the country, began to develop culturally. In the latter part of the period Kamakura produced certain types of art that were characteristic of the area, and finally it became second only to Kyoto as the artistic center of Japan.

Muromachi period. The animating spirit of this age was Zen Buddhism. While Buddhist art had previously served strictly religious ends, in Zen the emphasis was on human experiences. The black-and-white painting termed *sumi-e* or *suiboku-ga* (India ink painting), which flourished in this period, is an example of the new kind of art and is characterized by austere simplicity.

The personal taste of the Ashikaga shoguns, such as Yoshimitsu (1358–1408) and Yoshimasa (1435–90), also played an important part in matters of art. The Ginkaku (Silver Pavilion) or Jishōji and the Kinkaku (Golden Pavilion) or Rokuonji, erected in the shoguns' villas on the outskirts of Kyoto, illustrate their manner of living; though sumptuous, these buildings are subdued and moderate (*shibui*). Up to this time the art had been concentrated in the Buddhist temples, but now the shoguns' private residences too were repositories of art. Under the patronage of the shoguns the *cha-no-yu* (tea ceremony or tea cult) and the No play, performed with slow, elegant dances, were developed. The spreading of the rulers' artistic taste to the lower classes eventually paved the way for the arts of the early modern period.

Momoyama period. This age was dominated by the three rulers: Oda Nobunaga (1534–82), Toyotomi Hideyoshi (1536–98), and Tokugawa Ieyasu (1542–1616). The arts boldly manifested the spirit of a new age. The huge castles built at this time, some still standing, are characteristic of the period. The paintings decorating the walls, sliding doors, and screens of the castles and temples were ornate and powerful works. Kanō Eitoku (1543–90), Kanō Sanraku (1559–1635), Kaiho Yūshō (1533–1615), and Hasegawa Tōhaku (1539–1610) were among the master artists in this field. Minor arts, for interior decoration, also reflected the spirit of the age, typified by the bold, unconventional designs in the Kōdaiji style of *maki-e* lacquer. Although florid grandeur prevailed, there also arose at this time the quiet and secluded (*wabi*) type of tea ceremony inspired by Sen-no-Rikyū (1521–91), who emphasized rustic simplicity.

It was in this period that Japan first had contact with Western civilization. The Portugese and the Spanish began to visit Japan, introducing Christianity, and this contact gave rise to a more or less Western style of art known as *namban* (Southern Foreigners, as the Westerners were called, since they came by way of the south Pacific; see NAGASAKI SCHOOL). Kyoto and the neighboring areas still held a central position in the arts but the metropolitan culture spread rapidly throughout the country, as shown by the many castles and other relics of the time that are found in all parts of Japan.

Edo period. From 1615 to 1867 the Tokugawas ruled the country from Edo (mod. Tokyo). They encouraged Confucianism (q.v.), banned Christianity, and isolated Japan from the world. Trade with China was barely maintained, and only the Dutch were permitted at the port of Nagasaki, so that there was little foreign contact.

The development of residential architecture for the lower classes was one of the new achievements in this period, for in this type of architecture there had been little progress since early times, whereas religious, palace, and castle architecture as well as dwellings for the nobility and the warriors had made notable strides. Beside the Kanō school (q.v.), who worked for the feudal government, there arose various new schools of painting, each with its distinctive style. One of these was Ukiyo-e (q.v.), an art by and for the townsmen, dealing with subjects of popular character. Sculpture, closely connected with religion, went into a decline, but the minor arts developed considerably in nearly all parts of Japan because they were in great demand by the people.

Meiji-Taisho period. Toward the end of the Edo period the feudal system declined. Inside the country there was agitation to overthrow the feudal government and restore national rule to the emperor; from outside, the European countries and America demanded that Japan's ports be opened for trade. The entire country suffered from continual social disturbances, until finally the Tokugawa government fell and the imperial court resumed its rule in 1867. The year 1868 marks the beginning of the Meiji period, also called the modern period. The Meiji government adopted a constitutional system, abolished the caste system, discarded the policy of national isolation, and resumed communications with the outside world.

In the past, foreign influence had been almost exclusively Chinese; now European and American influence was predominant, with the result that the arts underwent a radical change. The most important innovation was the abandonment of the hereditary system in the practice of the artistic professions; for the first time artists and craftsmen were allowed to engage in the arts solely on the basis of their personal gifts. Wood had been the principal material in traditional architecture; now, under Western influence, other materials, such as brick and concrete, were utilized. Oil colors began to be used in painting. Statues of marble and alabaster were made, as well as the traditional sculpture in wood. Thus many changes were effected in all branches of the arts. For a while during the Meiji period (1868–1912) the excessive admiration of Western culture led to the neglect of the traditional Japanese arts; however, the artistic heritage of Japan was soon rediscovered. The felicitous merging of East and West constitutes the chief characteristic of modern Japanese arts.

Takeshi KUNO

Tendencies of contemporary art. The impact of Western civilization on Japan at the beginning of the Meiji period quickly led to the abandonment of traditional arts. However, thanks to Ernest Fenollosa, an American professor, and Okakura Kakuzo (Tenshin), a Japanese critic, who formed a society for the propagation of traditional Japanese art, the balance of critical values was soon restored. Okakura was head of the Nihon-ga (Japanese-style painting) movement, and Nihon-ga, despite many subsequent attempts to modernize it, exists today and persists in a rigid formalism.

Among the more important movements and tendencies in the present century are the Nippon Bijutsuin or Inten, founded by Okakura; the Seiryū-sha (Blue Dragon Group) of Kawabata Ryūshi;

the *d'après nature* school of Takeuchi Seihō (PL. 330); the modernizing movement in Ukiyo-e; and the work of Murakami Kagaku, which combines Nanga traditions with a sort of mystical romanticism. In the 1930's some young Nihon-ga painters formed the Sōzō Bijutsu (Creative Art) group, freer in their imagery and means of expression and influenced by contemporary Western painting. The younger generation, those painting after World War II, are attempting to free themselves from the traditional motifs and forms although using the traditional techniques.

In 1876 the first art school in Japan was established in Tokyo; a course in Western oil painting was given by Antonio Fontanesi (1818–82), an Italian. The Barbizon school and impressionism were introduced by Japanese artists who had studied in Europe. Artists appeared, such as Shigeru Aoki, who combined the European romanticism of the late 19th century with mythical Japanese elements. In 1910 the Shirakaba school, a group of writers and artists, was founded; they introduced the works of Cézanne, Van Gogh, Gauguin, Rodin, and Bourdelle to Japan. In 1914 the Nika-kai was organized in opposition to the academism of the official salon. Prominent among the Western-style painters are Umehara Ryūzaburō (b. 1888), a student of Renoir, whose style is remarkable for its Japanese sense of color and simplification of form; and Yasui Sōtarō (1888–1955), influenced by Pisarro and Cézanne, who developed a sober and very individual graphic style. Fauvism, cubism, futurism, and German expressionism were introduced in Japan after 1920.

In 1930 the Dokuritsu Bijutsu Kyōkai (Independent Art Association) was founded by artists who were influenced by Derain, Vlaminck, and the School of Paris. In 1937 Hasegawa Saburō formed the Jiyū Bijutsuka Kyōkai (Liberal Artists Association), a group interested in abstract art. In 1939 another avant-garde group, the Bijutsu Bunka Kyōkai (Art Culture Association), which promoted surrealism, was founded by Fukuzawa Ichirō. Many organizations were founded and, in time, split into new groups, and often what began as an opposition movement ended as a simple professional association.

All forms of liberalism in the arts were suppressed during World War II, but freedom of expression was restored after the war. What stands out in the postwar years is the marked activity of the artists of the younger generation, to be seen especially in the two annual Independent Exhibitions, held without judges and without prizes, where artists freely exhibit, with only a nominal fee for wall space. The problems of contemporary art in Japan after 1950 are in general parallel to those in Europe and America.

There has been a revival in the art of the woodprint. Since the 1920's, when such artists as Onchi Kōshirō began producing woodprints in a Western style, woodblock print artists have been very active. Their forms and techniques are freer (including copperprints and lithography). This field is considered today one of the outstanding expressions of contemporary art.

Calligraphy, which has always been looked upon as one of the fine arts, is practiced today by many artists, though there is, as always, the inevitable danger of mannerism. In the postwar years there has arisen a vigorous avant-garde movement of young calligraphers who combine the traditional characters with abstract and symbolic forms in a very contemporary way. This movement has a close and significant affinity with tachism.

In sculpture the drastic separation from tradition is evident; whether in wood, stone, or bronze, sculpture was almost always Buddhist, but in the present century it has completely lost its religious motive. As with painting, a distinct but parallel historical development with its Western counterpart is to be found in native sculpture. A few sculptors follow the special ancient technique of wood sculpture, but this art is too conventionally bound to express itself freely. Some sculptors were greatly influenced by Rodin, Maillol, and Bourdelle, but the works they produced were banal and complacently academic. The years after World War II have seen a revival of interest in sculptural art as well as a reappraisal of primitive sculpture. Some sculptors have been inspired by the simplicity of the *haniwa* and the extraordinary vitality of Jōmon figures. Abstract and expressionist tendencies prevail today. Ceramics, long considered one of the decorative arts, is also playing a part in modern sculpture. Also included in the field of sculpture are the *ikebana* or flower arrangements of Teshigahara Sōfu and his followers, who use wire, iron, stone, tree roots, boards, tin, etc., in conjunction with flowers.

Western-style architecture was introduced in the late 19th century by European architects. In 1920 the Japanese Secessionist group (Horiguchi Sutemi and other architects) was formed and after the earthquake of 1923 the group applied their new principles to the work of restoration. The influence of Frank Lloyd Wright (Imperial Hotel, Tokyo), of Antonin Raymond (long resident in Japan), and, since 1930, of Gropius and Le Corbusier has been great. The writings of Bruno Taut, the German architect who fled to Japan in 1933, on Japan's ancient architecture (such as the Great Shrine of Ise and the Katsura palace) were most influential. Owing to ultranationalist tendencies immediately before World War II, the modern architectural movement was suppressed.

Today architects are once again in a ferment with new ideas and fresh opportunities; functionalism and traditionalism are being applied in new projects with a harmonious unity. Even the typically native traditional wooden structures are becoming modernized and, at the same time, Western-style buildings are making increasing use of the best elements of traditional architecture. Town planning, although it frequently conflicts with the necessity for industrial development, is generally respected in the reconstruction of the city areas devastated in the war.

In minor arts, the traditional craftsmen ignore new forms and work with conventional techniques and designs. The *mingei* (folk art) movement, led by Yanagi Muneyoshi (who had been a member of the Shirakaba school), stresses functional beauty and tries to preserve the best of the folkcrafts. Outstanding among the *mingei* ceramists are Tomimoto Kenkichi and Kawai Kanjiro. Industrial designs for mass production had long been neglected, but in 1952 the Japan Industrial Designers' Association was organized, whose members, together with the graphic designers, are strongly conscious of the need for genuine expression and creativity through the new industrial techniques.

Japan has been passing through a complicated cultural phase, but today she is seeking to evolve a new style that will be open to contemporary Western currents but will not neglect traditional elements. Thus it is hoped that Japanese art, which refuses to be isolated, will play an increasingly important part in the art and culture of the world.

Shuzo TAKIGUCHI

KINKI DISTRICT. *Historical outline.* The Kinki district, situated in the central part of the principal island, consists of seven administrative prefectures: Osaka, Kyoto, Nara, Shiga, Mie, Wakayama, and Hyogo. The district was the first political center of the nation. Arts developed here from very early times, and there remain numerous sites and monuments of various periods. The sites of the Jōmon period are relatively few, but those of the Yayoi period are numerous. The people of the Yayoi period, who depended chiefly on agriculture (rice), appear to have been the first cultivators of the Yamato plain and the plain situated to the east of Osaka Bay. During the Bronze Age, the Kinki district was the center of the culture represented by *dōtaku* (bell-shaped bronzes); in the Kyushu district another type of culture existed, represented by *doken* (bronze swords) and *doboko* (bronze spears). The existence of numerous huge tumuli in this district proves that a powerful clan, supported by riches coming from the valleys in Yamato (Nara) and Kochi (Osaka) provinces, appeared about the 3d century, ruling over the district and subsequently over nearly the whole of Japan. Most of the tumuli were probably built about the 5th century. Bronze mirrors and coins found in burial chambers of the tumuli suggest the existence of communication with China during these times.

The Kinki district maintained its position as the cultural center of the country even after the introduction of Buddhism in the 6th century, as is evident from the records of the times and from the fact that 45 out of the 49 sites of Buddhist temples of this period are found in the Kinki district. The capitals of the country, that is, the cities where the emperors lived, which changed with every reign, were mostly situated in the Asuka area in Nara prefecture, and nearly all the existing specimens of art and architecture from the 7th century are found in this district. In the early 8th century a permanent capital, known as Heijo-kyō (Heijō capital; mod. Nara), was established, and this became the political as well as cultural center.

The capital was transferred to Heian-kyō (Heian capital; mod. Kyoto) at the end of the 8th century. The Kyoto area is rich in

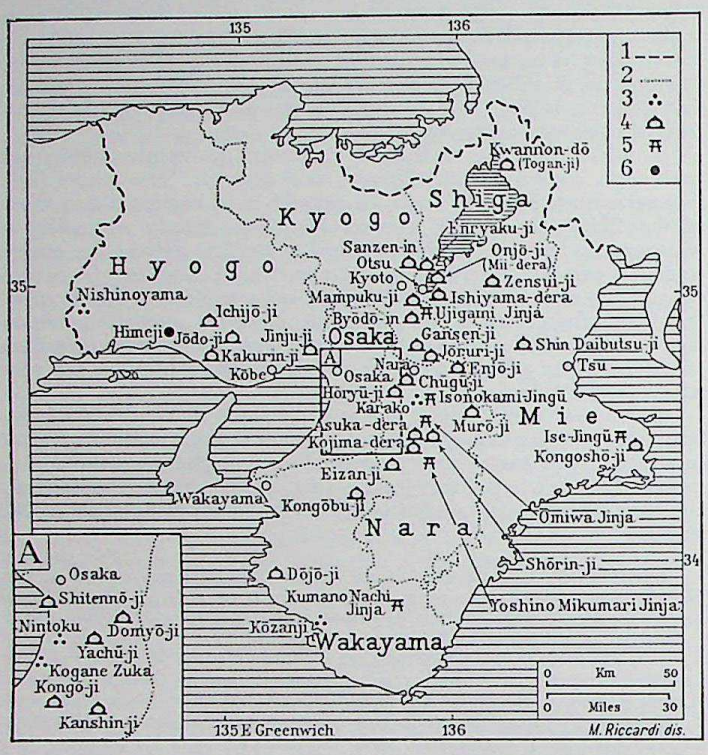
works of art dating from the 8th to the 12th century. In the late 12th century the reins of power passed from the imperial court to the warrior Minamoto Yoritomo. Yoritomo established his military government in Kamakura in the Kanto district, but Kyoto still remained the cultural center of the country. Kyoto again became



Kinki district. *Key*: (1) District boundaries; (2) prefecture boundaries; (3) archaeological sites and tumuli; (4) Buddhist temples; (5) Shinto shrines; (6) secular buildings of historic interest.

the political center in the 14th century, when the Ashikagas set up their military government in the Muromachi quarter of Kyoto. In the 17th century the Tokugawas established their central feudal government in Edo (mod. Tokyo), which became and remained the administrative center of the country. The center of creative arts, however, remained in Kyoto, and it was only much later that Edo began to have its own distinctive art.

Regions and centers of artistic interest. a. Prefecture of Nara. Nara. The city, capital of Nara prefecture, was founded in 710 by the empress Gemmyō (661–721) and was modeled on the ancient Chinese capital Ch'ang-an. For 18 years it was called Heijō and on the site of Heijō-kyō are remains of palace buildings of the Nara period. Nara was the first permanent capital of Japan and continued as the capital until 784, when the emperor Kwammu transferred the seat of administration to Nagaoka (west of Kyoto). It was the scene of the earliest historic events in the province of Yamato (Kii Peninsula), and it gave its name to a period of art history. The seven great Buddhist temples, the Shintoist monasteries, the magnificent palaces, and other buildings all bear witness to Nara's splendor and importance during many centuries of artistic activity.

Tōdaiji: Headquarters of the Kegon sect. In 740 the emperor Shōmu issued an imperial edict to make a colossal bronze statue of Rushana Butsu (Vairocana); the statue, the Daibutsuden (Great Buddha hall), and other buildings of the Tōdaiji were completed in 752. The Tōdaiji is the largest temple of the Nara period. Most of its original main buildings were destroyed in repeated fires, but many important buildings and works of art of various periods remain. The Nandaimon (great south gate), the front entrance of the temple, was built in 752 and rebuilt in 1199 after being destroyed by a typhoon in 962; it is in the Tenjikuyō or "Indian" style of architecture. The exterior niches of the Nandaimon contain standing wood statues (Kamakura period) of the Niō (Two Deva Kings; PL. 291), the joint work of Unkei and Kaikei (qq.v.). The two-storied Daibutsuden (Edo period) contains a seated bronze statue of Rushana Butsu 53½ ft. high. The knees of the statue and the petals of the lotus pedestal are original, and the rest is a restoration of the Edo period. The lotus petals are engraved with pictures of the "Lotus-flower World" presided over by Rushana Butsu. The octagonal bronze lantern (Nara period) in front of the Daibutsuden is a typical specimen of 8th-century metalwork. The Hokkedō, or Sangatsudō (Third Month Temple), was founded in 733 by the monk Rōben; it consists of a main hall (Nara period) and a Raidō (chapel; Kamakura period). In the Hokkedō are the following famous statues, all of the Nara period: Fukūkenjaku Kwannon (Amoghapaśa), a standing dry-lacquer statue 12 ft. high, ca. 748; Bonten (Brahmā), Taishakuten (Indra), the Shitennō (Four Deva Kings), and the Niō, all standing dry-lacquer statues; and Nikkō Bosatsu (Sūryaprabhāsa), Gakkō Bosatsu (Candraprabhāsa), Shūkongojin (Vajrapāni), Kichijōten (Mahāśrī), and Benzaiten (Sarasvatī), all standing clay statues. The sutra repository of the Hokkedō is of the Nara period. The Kaisandō (Kamakura period) is dedicated to Rōben, founder of the temple, and contains seated wooden statues of Rōben (Jōgan period; II, PL. 392), the priest Shunjō (Kamakura period), and the Shinto god Hachiman as a Buddhist priest (Kamakura period; PL. 295) by Kaikei. In the Kaidanin are standing clay statues of the Shitennō (Nara period). In the belfry (Kamakura period), east of the Daibutsuden, is a temple bell, 13½ ft. high and 9½ ft. in diameter, cast in 752 and recast in 1239 after being damaged by the typhoon of 989. Other buildings are the Tengaimon (gate) of the Nara period and the Ōyuya (bath-house for priests) of the Muromachi period. The Tōdaiji owns numerous other treasures, among which are the Birth of the Buddha (Nara period), a bronze statue; 21 wooden Gigaku masks (Nara period), most of which were used at the consecration ceremony of the Rushana Butsu statue; 8 wooden Bugaku masks (Fujiwara and Kamakura periods); standing wooden statues of Jizō Bosatsu (Ksitigarbha) and Miroku (Maitreya) by Kaikei (Kamakura period; PL. 345); and the Kusha Mandara (Kamakura period), a painting in color on silk. The Shōsōin, west of the Daibutsuden, was built in the mid-8th century. With its 40 pillars supporting a high floor and its sides composed of triangular horizontal members, the Shōsōin belongs to the type of construction known as *azekura*. It houses treasures from the Nara period, the nucleus of the collection being ritual implements used at the consecration ceremony, objects for the personal use of Emperor Shōmu, and manuscripts.

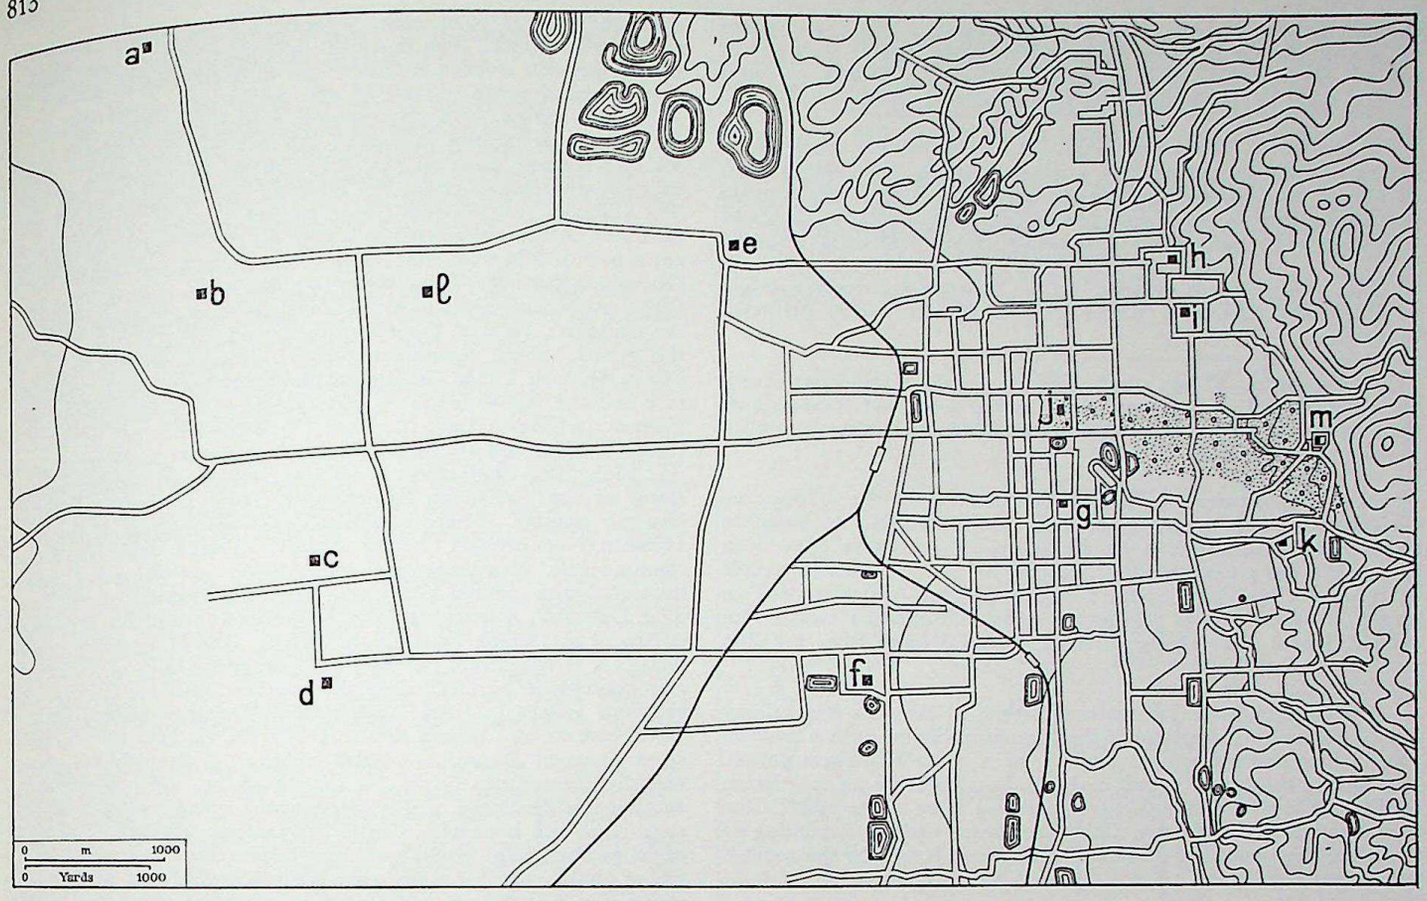
Kasuga Shrine: A typical example of the Kasuga type of Shinto architecture, in which the sanctuary has a gabled front with an additional roof on its front over the staircase. The present buildings were built in 1863 but retain the style of the Nara period. The shrine contains many examples of painting, sculpture, and arms and armor, among which are a sword mounting of the *kenukigata* type (Fujiwara period), gold-lacquered with mother-of-pearl inlay, and a suit of armor with red lacing (Kamakura period).

Kōfukuji: Headquarters of the Hossō sect and one of the seven great temples of Nara. The Kōfukuji, the family temple of the Fujiwaras, was originally founded in 669 and transferred in 710 to its present site. At one time there were as many as 175 buildings in the precincts, but all were subsequently destroyed by fire. However, the temple still retains many buildings of later periods and numerous important works of art. The Tōkondō (eastern main hall), first built in 726 by order of Emperor Shōmu and repeatedly burned down, was finally rebuilt in the 15th century; it contains seated wooden statues of Monju (Mañjuśri) and Yuima (Vimalakīrti), both of the Kamakura period, and a bronze head of Yakushi (Bhaiṣajyaguru) of 685, which shows Chinese influence. The Hokuendō (north octagonal hall) was first built in 721 by order of Empress Gemmyō, and destroyed three times; the present building dates from 1240. It contains a seated wooden statue of Miroku (Kamakura period) by Unkei and standing wooden statues of the priests Muchaku (Asaṅga) and Seshin (Vasubandhu), both of the Kamakura period, by Unkei and assistants. The three-storied pagoda was built at the wish of Taikemmon-in, consort of Emperor Gotoba, in 1143. The five-storied pagoda, originally erected in 730 at the wish of Empress Kōmyō, was destroyed five times by fire; the present building was completed in 1426. The Nanendō (south octagonal hall) was built in 813 and repeatedly burned, and the present building dates from 1789. It contains the following wooden statues (Kamakura period) by Kōkei, father of Unkei: the Fukūkenjaku Kwannon, a seated statue made in 1188; the Shitennō, standing statues; and the Hossō Rokuso (Six Patriarchs of the Hossō sect), seated statues. Also in the Kōfukuji are the Hachibushū (Eight Guardian Devas; PL. 268) and the Jūdai Deshi (Ten Great Disciples), of which only 6 remain; these 14 standing dry-lacquer statues, made in 734, are representative masterpieces of sculpture of the Nara period. There are also standing statues by Jōkei of the Niō (Kamakura period; VII, PL. 396); standing wooden statues of the lantern bearers Ryūtōki and Tentōki (Kamakura period) by Kōben, son of Unkei; and a color painting on silk of the priest Jion Taishi (Fujiwara period).

Shin-Yakushiji: Founded in 747 by Empress Kōmyō. In the main hall (Nara period) are the Jūni Shinshō (Twelve Heavenly Generals; Nara period), standing clay statues (one is a recent replacement), and a seated wooden statue of Yakushi, a fine specimen of single wood-block sculpture of the late 8th century.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri



Nara, plan of the city. (*a–k*) Buddhist temples: (*a*) Akishinodera, (*b*) Saidaiji, (*c*) Tōshōdaiji, (*d*) Yakushiji, (*e*) Hokkeji, (*f*) Daianji, (*g*) Gokurakuin, (*h*) Shōsōin, (*i*) Tōdaiji, (*j*) Kōfukuji, (*k*) Shin Yakushiji; (*l*) site of Heijō-kyō; (*m*) Kasuga Jinja.

Zuto: A large mound with stones on which are carved Buddhist images in relief (Nara period).

Cave temple at Jigokudani (Jōgan period).

Gangōji: Formerly called Asukadera, this was originally founded at the village of Asuka and transferred to its present location in the 8th century, when the capital was moved to Nara. Now dilapidated after recurrent fires, it contains a standing wooden statue of Yakushi (Jōgan period).

Gokurakuin: This consists of a main hall (IV, PL. 198) and a Zendō (contemplation hall), both of the Kamakura period.

Hokkeji: A convent founded in 745 by Empress Kōmyō. The main hall was rebuilt in 1601 and contains a standing wooden statue of Jūichimen Kwannon or Eleven-headed Kwannon (Ekādaśamukha), a masterpiece of so-called "sandalwood sculpture" style of the 9th century. Sandalwood sculpture is made of a hard incense wood, unpainted (except for the eyes and lips) so as to keep the fragrance of the wood alive. Because wood of this kind is rare in Japan, examples of real sandalwood sculpture are few, but its style was sometimes copied. Also in the main hall are a seated wooden statue of Yuima (Jōgan period) and a painting in color on silk of the Amida (Amitābha) Triad (Fujiwara period).

Saidaiji: Founded in 765 by Empress Shōtoku. It contains the Jūniten (Twelve Devas; PLS. 270, 274), paintings in color on silk, the oldest existing esoteric Buddhist paintings (Jōgan period); Shaka (Śākyamuni), a standing wooden statue by the monk Eison (1201–90), a copy of the Shaka statue in the Seiryōji, Kyoto; and a seated wooden statue of the priest Kosho Bosatsu (Kamakura period).

Tōshōdaiji: Founded in 759 by Ganjin (Chinese, Chien Chên), a priest of the T'ang dynasty. This important monument retains some of its original main buildings. The Kondō (Nara period) contains a seated dry-lacquer statue of Rushana Butsu, attributed to T'an Ching and Szŭ T'o, disciples of Chien Chên, a representative work of sculpture of the late Nara period; standing dry-lacquer statues of Senju Kwannon or Thousand-handed Kwannon (Sahāsrabhuja) and Yakushi, both of the Nara period; standing wooden statues of Bonten and Taishakuten, carved by Chun Fa Li, and of the Shitennō, all of the Nara period; and a dry-lacquer statue of Ganjin, a masterpiece of portrait sculpture of the Nara period. The Kōdō (lecture hall), rebuilt in 759 by Chun Fa Li, was originally the assembly hall of the Nara court. In it are a Yakushi (Nara period), a standing wooden statue, and numerous other works of wooden sculpture from the last part of the Nara period. Treasure repository (Nara period). Sutra repository (Nara period). Raidō (Kamakura period). The Korō (drum tower; Kamakura period) contains the Tōsei E-den, a scroll painting in color on paper (Kamakura period) illustrating stories about Ganjin's trip to Japan.

Yakushiji: This temple was begun in 680 by Emperor Temmu and finished in 698. Originally located at Fujiwara in the Asuka area, it was moved to its present place in 718, following the transfer of the capital to Nara. The temple has excellent specimens of art from the early Nara period. The three-storied east pagoda (Nara period; PL. 283) is the most beautiful pagoda in Japan. The Yakushi Triad (Nara period), kept in the Kondō (which was rebuilt in 1600), is a masterwork of bronze sculpture following the early T'ang style, ascribed by some scholars to ca. 697 and by others to ca. 718. In the Tōindō (east hall; Kamakura period) is a standing bronze statue of Kwannon (Avalokiteśvara), and in the Kōdō is another bronze Yakushi Triad, all of the Nara period; these, together with the Yakushi Triad in the Kondō, are among the most eminent works of bronze sculpture. In the Bussokudō (hall of the Buddha's footprint) is a stone with the Buddha's footprint made in 752, based on a copy of the reproduction of the Buddha's footprint brought from China by the Japanese painter Kibumi-no-Motozane; this reproduction was brought from India to China by the Chinese priest Wang Hsüan-ts'e. The Yakushiji also contains a standing wooden statue of Jūichimen Kwannon (Nara period); seated wooden statues of three Shinto deities (Jōgan period; PL. 271); Kichijōten (PL. 269), a painting in color on hemp cloth which is a typical example of Nara painting following the T'ang style; and Jion Taishi (Fujiwara period), a painting in color on silk.

National Museum: Founded in 1895, it has 13 exhibit rooms and possesses a fine collection of ancient works of art, particularly of the Nara period. Also exhibited are objects on loan from shrines, temples, and private collections, mainly of the Asuka through Heian periods and from Nara prefecture.

Sakurai. Village 12 miles south of Nara. This is an important communications center, for the roads and railways south to the Kii Peninsula pass through it. Near Sakurai are two tumuli of the Great Burial period: the Tennōzan tumulus, a square tumulus ca. 148 ft. east to west, 138 ft. south to north, and 31 ft. high; and the Chausuyama tumulus, squared in front and rounded in the back (keyhole-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

shaped), ca. 656 ft. long. The Shōrinji contains a dry-lacquer statue of Jūichimen Kwannon, a representative specimen of sculpture of the 8th century. The Shakuiji, at a site known as Ossaka, possesses a stone relief of the Buddha and two attendants (Nara period).

Yanagimoto. Village near Nara. The Chōgakuji has a two-storied gateway (Fujiwara period) and a wooden Amida Triad dated 1151. Statues of the Kamakura period are characterized by a vivid expression owing in part to the eyes inlaid with crystal; this Amida Triad is notable as one of the earliest examples of the use of inlaid crystal eyes.

Abe. Village south of Nara. In the Monjuin are wooden statues of Monju and attendants (Kamakura period), traditionally attributed to Kaikei.

Kawahigashi. Village south of Nara. At the Karako site (Yayoi period) beautiful earthenware, wood, horn, bone, and stone articles were found, as well as personal ornaments such as lacquered wooden bracelets and combs.

Miwa. Small town 11 miles south of Nara on the railway line to Takada. Close to the town is the Ōmiwa Shrine dedicated to Ōmononushi-no-Mikoto, a Shinto deity; it is said to have been founded in the 1st century B.C. and may be the most ancient temple in Japan. It is situated at the foot of Miwa hill, which is itself an object of worship — an interesting example of nature worship in ancient Japan. The Haiden (hall of worship) dates from the Edo period.

Tambaichi. Small town 6 miles south of Nara on the railway line to Sakurai. To the east is the Isonokami Shrine with a remarkable Haiden and two-storied gateway, both of the Kamakura period. The shrine contains a sword, 29½ in. long, bearing an inscription inlaid in gold with a date that is interpreted to be of the year Tai-ho 4 (A.D. 369) of the Eastern Chin dynasty of China. According to tradition, this sword was presented to Emperor Jimmu by the goddess Amaterasu Ōmikami.

Asuka. Village near Nara. The Buddhist temple of Asukadera (also called Hōkōji and Gangōji) was founded by Soga-no-Umako in 588. Recent excavation of the original site of this temple proves that it had a pagoda, main hall, and lecture hall in a straight south-north row, plus two more main halls to the east and west of the pagoda, a plan suggesting Korean influence. The temple contains a seated bronze statue of Shaka; the image was made in 606 by Tori, but only the head is original.

Harigabessho. Village near Nara. The Kinryūji contains a standing wooden statue of a *bosatsu* (bodhisattva; Nara period).

Takaichi. Near this village is the Ishibutai tumulus (Great Burial period). It is known as Ishibutai (stone stage) because the soil covering the tumulus is gone, exposing the huge rocks that form the ceiling of its burial chamber. Pottery fragments of the so-called "Haji ware" and "Sue ware" found here suggest that the tumulus belongs to the Asuka period.

Unebi. Small town 15½ miles south of Nara. Nearby is the site of the imperial palace of Fujiwara, built in 694 by the empress regnant Jitō. Fujiwara remained the seat of imperial rule until 710. There are remains of some important palace buildings. The Yamato Rekishikan at Unebi contains archaeological material from the Yamato district.

Takatori. In this village is the Kojimadera, which contains the Kojima Mandara (Jōgan period). Painted in gold and silver on purple twill silk, this mandara is an important specimen of esoteric Buddhist art of the 9th century.

Ikaruga. Village southwest of Nara. Nearby is the famous Hōryūji (PL. 282), originally built in 607 by the empress regnant Suiko and Prince Shōtoku Taishi in obedience to the will of the deceased emperor Yōmei. It seems that the buildings were destroyed by fire in 670 and were reconstructed soon after that, although another theory says that the temple which was burned was a different temple and that the main buildings still existing date from the first half of the 7th century. They are, in any case, the oldest wooden buildings in the world. The two-storied Kondō is a representative example of 7th-century architecture; the 28 massive pillars have a slight entasis and eaves bracketing in "cloud" form. The Kondō was partly burned down in 1949, and the present building, an exact replica, was completed in 1954. In the Kondō is the bronze Shaka Triad, made in 623 by the famous sculptor Tori. The central figure, a seated Shaka, is 34 in. high. This triad is the greatest extant piece of Asuka sculpture. Also in the Kondō are a bronze seated Yakushi (Asuka period); wooden statues of the Shitennō (Asuka period); and three wooden canopies, two of the Asuka period and one of the Kamakura period. The five-storied pagoda, built in 607, is the oldest existing pagoda in Japan. On the first floor of the pagoda are clay statues; made in 711, they are fine works of art and give valuable information about the manners and costumes of the time. The Chūmon (middle gate), built in 607, has covered corridors on each side of the two-storied gateway. In the niches of the Chūmon are a pair of Niō with clay heads (Nara period) and wooden bodies (Kamakura period). The cloister is of the Asuka period. The Kōdō (Fujiwara period) contains wooden statues of the Yakushi Triad and the Shitennō, both of the Fujiwara period. The Shōryōin (hall of the sacred spirits; Kamakura period) contains wooden statues of Prince Shōtoku Taishi and attendants (Fujiwara period). The refectory and the Kyōzō (sutra repository) are of the Nara period. The Yumedono (Dream Hall; Nara period) is the main hall of the Tōin (East Temple) and the most beautiful octagonal building in Japan (PL. 282). The chief object contained there is the standing wooden statue of the Yumedono Kwannon (PL. 262), a masterpiece of the late 7th century. There is also a dry-lacquer statue of the priest Gyōshin (Nara period), founder of the building (d. 750). The E-dono (picture hall; Kamakura period) contains several sliding screens decorated with pictures illustrating the life of Prince Shōtoku Taishi. The Dempōdō (preaching hall; Nara period) contains dry-lacquer statues of the Amida Triad (Nara period). The Daihōzōden (treasure hall) is a ferroconcrete building containing treasures of the Hōryūji and consists of two galleries, the southern and northern. In the southern gallery is Lady Tachibana's Miniature Shrine, made of wood, containing a bronze Amida Triad (IX, PL. 514), both representative pieces of decorative art and sculpture of the early 8th century; and the Tamamushi Zushi (Asuka period; PL. 418), so termed because it was decorated, under its openwork metal borders, with wing sheaths of the *tamamushi* beetle (*chrysochroa elegans*). The panels of its pedestal have Jātaka paintings (representing episodes from the life of Shaka), which are the only existing examples of painting from the first half of the 7th century. The southern gallery also contains an example of *shokkō-kin* (gold brocade) of the Asuka period in the style of the Chinese *shu-hung-chin*. In the northern gallery is a standing wooden statue of Kwannon (Asuka period), popularly known as the Kudara Kwannon (PL. 396). This tall, slender figure is numbered among the most beautiful works of Japanese sculpture. Also in the northern gallery are a wooden nine-headed Kwannon (T'ang dynasty); a Buddha with two attendants (Nara period) in copper repoussé; 29 Gigaku and Bugaku masks of the Nara, Fujiwara, and Kamakura periods; and a fan-shaped sutra, painted in color on silk (Fujiwara period.)

Chūgūji: This contains a seated wooden Miroku in meditation (Asuka period, PL. 266; II, PL. 396), which is famous for its modest, elegant beauty. The temple calls this statue Nyoirin Kwannon (Cintāmaṇicakra), but this name is erroneous because the worship of Cintāmaṇicakra in Japan did not begin until the 9th century. The embroidery known as the Tenjukoku Mandara (PL. 267) is the oldest existing work of embroidery in Japan (622) and was made by Tachibana-no-Oiratsune, consort of Prince Shōtoku, in memory of the Prince. Only a few fragments of the mandara remain.

Tomisato. Village north of the Hōryūji. The Hōrinji was founded in 622 by Yamashiro-no-Ōe, eldest son of Prince Shōtoku Taishi. It contains a Yakushi, a seated wooden statue, and a Kokūzo (Ākāśagarbha), a standing wooden statue, both of the Asuka period. East of the Hōrinji is the Hōkiji (or Hōkkiji), founded in 638 by the priest Fukuryō. The chief attraction here is the three-storied pagoda which is said to date from 686.

Taima. Village south of the Hōryūji, near which is the Taimaji or Taimadera. Said to have been originally built in Kochi province in 612 by Prince Maroko, son of Emperor Yōmei, and moved here in 673. The Kondō (Kamakura period) contains a seated clay statue of Miroku (Nara period) and the Shitennō (Nara period), the oldest existing dry-lacquer statues in Japan. In the Hondō (main hall; also called the Mandaradō) is the Taima Mandara (Kamakura period), a painting in color on silk, which represents the Buddhist paradise (*gokuraku-jōdo*). This picture is a copy, made in the Kamakura period, of the original mandara painted in 673; fragments of the original are also in the temple, in a very bad state of preservation. The east and west pagodas are both of the Nara period. Situated in the compound of the Taimaji is the Buddhist Oku-no-in.

Kawai. Village near Taima. This is the site of the Samida Takarazuka tumulus (Great Burial period), a keyhole-shaped tumulus ca. 295 ft. long.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Uchi. In this village is the Eizanji. In the octagonal hall (Nara period) are paintings in color on wooden panels.

Yoshino. Small town in the middle of the prefecture of Nara. Near the town is the Mikumari Shrine, built in 1604 by Toyotomi Hideyori. The shrine buildings (Momoyama period) are the sanctuary, hall of worship, hall of offerings, two-storied gateway, and cloister. Inside the sanctuary is a seated wooden statue of the Shinto goddess Tamayorihime-no-Mikoto, a masterpiece of Shinto sculpture of the Kamakura period.

Daianji. Village on the outskirts of Nara. The temple of the same name was founded in 639, but was moved in 710 to its present site. Of the original temple only ruins remain. In the Daianji are preserved standing wooden statues of Senju Kwannon and Fukūkenjaku Kwannon, both of the Nara period, together with nine other wooden statues from the Nara period.

Oyagyu. Village on the outskirts of Nara. The Enjōji contains a seated wooden statue of Amida (Fujiwara period) and a statue of Dainichi Nyorai (Vairocana Tathāgata; PL. 292), made by Unkei in 1176, in the joined-wood technique, with eyes inlaid with crystal.

Heijō. In this village is located the Akishinodera. It was founded in 780 at the wish of the emperors Kōnin and Kammu but destroyed by fire in 1135, except for the Kōdō. Later the Kōdō was restored and became the Hondō (Kamakura period). Here the representation of Gigeiten, goddess of the arts, is kept; the standing figure is of wood (Kamakura period) with a dry-lacquer head (Nara period). There is also a standing dry-lacquer statue of Bonten (Nara period).

Murō. Village on the Kinki railway line, east of Sakurai. The Murōji is situated deep in the mountains, and is the only complex in which buildings of the 9th century survive. In the Kondō (Jōgan period) are standing wooden statues of Yakushi, Monju, Jūichimen Kwannon, Jizō Bosatsu, and Shaka, all of the Jōgan period. In the five-storied pagoda (Jōgan period, although it is claimed that the pagoda was inherited from a temple on the site founded ca. 790) are wooden statues of Miroku and Shaka, also of the Jōgan period.

b. Prefecture of Kyoto. Kyoto. The capital of Kyoto prefecture was founded in 794 by Emperor Kammu. It was the capital of the country until 1868, when the capital was moved to Edo (mod. Tokyo). The new city, called Heian-kyō (capital of peace and tranquillity), was completed in 805 and, like Nara, it was modeled after the Chinese capital of Ch'ang-an. The history of Kyoto is full of misfortune and disaster. Twice the imperial palace was destroyed, first in 960 and again in 1177. In 1221 the city was seized by the Kamakura Shogunate, and from 1336 on was the scene of many battles. A brief interlude of peace followed, but from 1467 to 1474 Kyoto was again desolated owing to the rivalry between the opposing Yamana and Hosokawa forces. In 1569 it was occupied by Oda Nobunaga, who found the town in a deplorable condition and set about rebuilding the imperial palace; this was completed by Toyotomi Hideyoshi, who also restored the temples and other famous buildings. Kyoto, with its magnificent temples, gardens, and beautiful, stately palaces, is, even today, the spiritual and artistic center of Japan.

Imperial palace: This is located in the imperial park and was originally built by Emperor Kammu in 794; it was often destroyed by fire and the present buildings date only from 1854. However, the buildings are in the same style as the original palace, so they are valuable sources of information about the style of palace architecture of the Heian period. The Shishinden (ceremonial hall; Edo period) is used for important state functions. The Seityōden ("serene and cool chamber"; Edo period) is decorated with paintings of the Tosa school; this was the hall where the emperor lived.

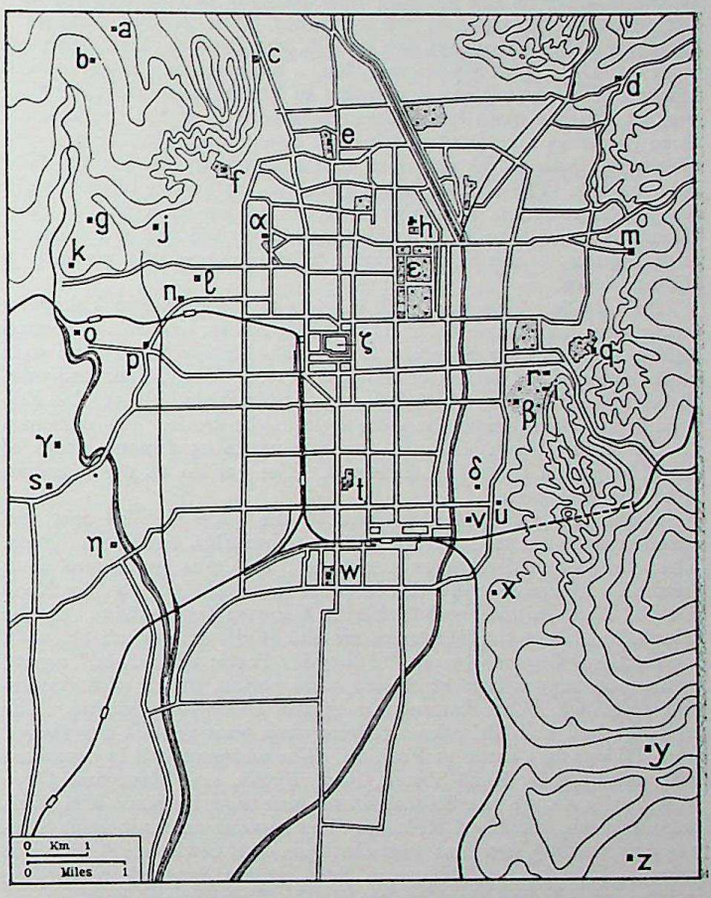
Shōkokuji: A great monastery of Zen Buddhism built in 1382 by Ashikaga Yoshimitsu. The Hattō (lecture hall; Momoyama period) was rebuilt by Toyotomi Hideyori.

Nishijin: The district near the northwest corner of Kyoto. Since about the 16th century Nishijin has been a center of textile manufacture, famous for products of high quality known as Nishijin fabrics. Silk gauze, silk crepe, "Japanese brocade," "Chinese brocade," gold brocade, Ming-style damask, and satin, as well as European-style lace and velvet, are still made here.

Daihōonji: In the main hall (Kamakura period) are standing wooden statues of the Jūdai Deshi, by Kaikei, and of Shaka, all of the Kamakura period.

Kitano Shrine: A Shinto temple, also called Kitano Tenjin. It is dedicated to Sugawara-no-Michizane (845–903), the greatest scholar of Chinese literature of his time; he was deified under the name of Tenjin. The shrine was founded in 947, but the present buildings were rebuilt in 1607 by Toyotomi Hideyori. Among the temple treasures are nine scrolls of the Kitano Tenjin Engi by Fujiwara-no-Nobuzane (1176–ca. 1268), an illustrated history of the Kitano Tenjin, painted in color on paper; two scrolls of the Kitano Tenjin Engi by Tosa Yukimitsu (14th cent.), painted in color on paper; and Dragons and Clouds, folding-screen painting by Kaiho Yūshō (1533–1615).

Rokuonji (popularly known as Kinkakuji): This was originally the Kitayama villa of the Saionji family, which Ashikaga Yoshimitsu (1358–1408) bought and enlarged. After Yoshimitsu's death the villa was converted into a Buddhist monastery. The three-storied Kinkaku (Golden Pavilion), so named because it was originally covered with gold leaf, was built ca. 1394–1427, and was representative



Kyoto, plan of the center of the city. (*a–z*) Buddhist temples: (*a*) Kōzanji; (*b*) Jingoji, (*c*) Kōetsudera, (*d*) Shūgakuin, (*e*) Daitokuji, (*f*) Rokuonji (Kinkakuji), (*g*) Daikakuji, (*h*) Shōkokuji, (*i*) Chionin, (*j*) Ninnaji, (*k*) Seiryōji; (*l*) Myōshinji, (*m*) Jishōji (Ginkakuji), (*n*) Hokongōin, (*o*) Tenryūji, (*p*) Kōryūji, (*q*) Nanzenji, (*r*) Shōrenin, (*s*) Saihōji, (*t*) Nishi Honganji, (*u*) Chishakuin, (*v*) Rengeōin, (*w*) Kyōōgokokuji, (*x*) Tōfukuji, (*y*) Sambōin, (*z*) Hōkaiji. (α-δ) Shinto shrines: (α) Kitano Jinja, (β) Yasaka Jinja, (ν) Matsunoo Jinja, (δ) Hōkoku Jinja. (ε-η) Secular buildings: (ε) Imperial palace, (ξ) Nijō castle, (η) Katsura palace.

of the architecture of that time; it burned down in 1950 and was reconstructed in 1955. The garden (Muromachi period) is a fine example of landscape gardening of this period.

Kōetsudera: Buddhist temple containing the Taikyōan (Edo period), a tea-ceremony house. It was in this area that Hon-ami Kōetsu (1558–1637) established a village of artists which lasted from the late Momoyama to the early Edo period.

Daitokuji: This is one of the chief temples of Zen Buddhism, and was founded in 1324 by the priest Daitō Kokushi. The buildings in this monastery, although rebuilt in 1479, are typical examples of Karayō, an architectural style of Chinese origin. The Karamon (Chinese-style gate; Momoyama period) was transferred from Toyotomi Hideyoshi's Jurakudai Mansion. The present main buildings, except the Kuri (priests' living quarters; Muromachi period) and the two-storied Sammon (main gate), which was built in 1589 by Sen-no-Rikyū, the famous master of tea ceremonies, were constructed during the Edo period. In the Hōjō (superior's quarters) are 84 paintings by Kanō Tanyū (1602–74) mounted on sliding screens. Other paintings here are a triptych of Kuan-yin (Kwannon), Monkey, and Crane (X, PL. 201) in ink on paper and a diptych of Dragon and Tiger (X, PL. 201) in ink on silk by the Chinese painter Mu-ch'i

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

(q.v.); Kuan-yin (Sung dynasty), color on silk; and portraits of Daitō Kokushi and Emperor Godaigo, both of the Kamakura period, color on silk. In the enclosure of the Daitokuji are a number of small monasteries in which valuable works of art are preserved. The Shinjuan contains three paintings on sliding doors attributed to Soga Jasoku (d. 1483): two Landscapes and one Flowers and Birds. In the Daisenin are a Landscape attributed to Sōami (d. 1525), painted on sliding doors, and a painting of Flowers and Birds (1509) attributed to Kanō Motonobu (PL. 313). The Jūkōin contains the tomb of Sen-no-Rikyū; a tea-ceremony house (Momoyama period); and a number of Landscapes and Flowers and Birds painted on sliding walls (PL. 318) attributed to Kanō Eitoku (1534–90), which are representative masterworks of panel paintings in the Momoyama period. In the Sōkenin is the painting Rose Mallows in Rain (X, PL. 201) attributed to Mu-ch'i, in ink on paper. The Kōtōin contains a Landscape (Sung dynasty), ink on silk, and Peonies (Yüan dynasty), color on silk. The Gyokurinin has a tea-ceremony house named Minoan (Edo period) and a painting of Shaka in color on silk (Edo period). In the main hall (Momoyama period) of the Ryūkōin are three paintings attributed to Mu-ch'i: Persimmons (X, PL. 201) and Chestnuts, both in ink on paper, and a Landscape, in ink and faint color on silk. The Kohōan has a main hall, a building in *shoin* style, and seven tearooms in *sukiya* style, all of the Edo period. The Ōbaiin contains a main hall (Momoyama period) and a Landscape with Figures attributed to Unkoku Tōgan (1547–1618), painted on sliding doors.

Nijō castle: This was built in 1602 to accommodate Tokugawa Ieyasu and his retinue on their visits to Kyoto, and was decorated during the following 20 years; it is a valuable example of the style of the interiors of castles of the Edo period. The Mikuruma-yose, Tosaburai, Ōhiroma, Kuroshoin, and Shiroshoin, all of the Edo period, are examples of the *shoin* style in the castle. The paintings on the sliding doors and walls are fine works by famous artists of the Edo period (PLS. 114, 322–324). The garden of the *ninomaru* is of the Edo period.

Nishi Honganji: Headquarters of the Jōdo-Shinshū sect and considered by art critics to be the most beautiful temple in Kyoto. The Hiunkaku (Momoyama period; PL. 115) was transferred from Jurakudai Mansion; it is a three-storied building, decorated by Kanō Tanyū, Kanō Eitoku, and Tokuriki Zensetsu (1591–1680). In the Hiunkaku is kept the Sanjūroku-nin-shū (Fujiwara period; PL. 286), a collection of poems by the "Thirty-six Poetic Immortals," copied by famous calligraphers of the Fujiwara period, in ink with decorative paintings. The Karamon is of the Momoyama period. The audience hall and Shiroshoin (Momoyama period) were transferred from Hideyoshi's castle at Fushimi. The audience hall is decorated with paintings by Kanō Tanyū, Kanō Ryōku, and Maruyama Ōkyo (PLS. 325, 326). In the Shiroshoin are paintings by Kanō Kōi, Kaihoku Yūsetsu, and Kanō Ryōtaku. The two-storied Kuroshoin (Momoyama period) was also brought from the castle at Fushimi; it contains Warblers on Willow in Snow (Yüan dynasty), a painting in color on silk, and the Kumano Kaishi (Kamakura period), poems by Emperor Gotoba and others, in ink on paper.

Kyōōgokokuji (popularly known as Tōji or East Temple): A magnificent monastery built soon after the transfer of the capital to Heian (Kyoto) in 794. In 823 the Emperor donated it to the priest Kūkai, founder of the Shingon sect of esoteric Buddhism, and it became the center of the Shingon sect. The two-storied main hall, built by Toyotomi Hideyori between 1599 and 1606, contains wooden statues of the Godai Myōō (Five Great Kings; Jōgan period), which are representative specimens of esoteric Buddhist sculpture; Bonten and Taishukuten, wooden statues (Jōgan period); and the Shitennō, standing wooden statues (Jōgan period). The five-storied pagoda (Edo period), rebuilt by Iemitsu, the third Tokugawa Shogun, is the highest pagoda in Japan. It contains Bishamonten (Kubera; Jōgan period), a wooden statue in the form known as Tōbatsu Bishamonten, a unique form of the god that originated in Central Asia and was introduced to Japan through China; this is the original of all Tōbatsu Bishamonten statues. Also in the pagoda are seated wooden statues of Fudō Myōō (Acala) and of Monju as a priest, both of the Jōgan period, and the following paintings in color on silk, all of the Fujiwara period: a *sansui byōbu* (folding screen used in the Shingon initiation service, PL. 277); the Godai Myōō; two sets of the Jūniten, one set attributed to Takuma Shōga; and the Ryōgai (or Kongokāi) Mandara. The Kanchiin contains a painting in color on silk of Emmaten (Yama; Fujiwara period) and wooden statues of the Godai Kokūzō (five manifestations of Ākāśagarbha; T'ang dynasty).

Rokuharamitsuji: Founded in 963 by the priest Kūya. It contains wooden statues of Jizō Bosatsu, seated (Kamakura period; PL. 295); Jūichimen Kwannon, standing (Fujiwara period); and the priest Kūya, standing (Kamakura period), by Kōshō.

Chionin: Headquarters of the Jōdo sect, founded in 1211 by Hōnen Shōnin. The two-storied Sammon (Edo period) contains a painting in color on silk of Amida with 25 *bosatsu* (Kamakura period; PL. 296). The Seishidō contains the Hōnen Shōnin E-den (Kamakura period), 48 scrolls of an illustrated biography of Hōnen; paintings in color on silk of Bishamonten (Kamakura period), Jizō Bosatsu (Fujiwara period), and Tao-li-yüan and Chin-kuo-yüan (Sung dynasty); and Buddha and Two Attendants in copper repoussé (Nara period).

Tōfukuji: Founded in 1236. The two-storied Zendō, the Gekkamon (gateway), the Tosu (lavatory), and the Yokushitsu (bathhouse) are all of the Muromachi period. The last two buildings, where priests seek to purify themselves both physically and spiritually, are very important in a Zen monastery. In the two-storied Sammon (Muromachi period) are paintings in color on paper attributed to Minchō (also called Chōdensu; 1352–1431): a set of Five Hundred Rakan on 50 *kakemono* and a portrait of Shōitsu Kokushi, the founder of the Tōfukuji.

Hōkoku Shrine: Shinto temple dedicated to Toyotomi Hideyoshi. It was originally built in 1599 by order of Emperor Goyōzei, then rebuilt in 1868. The Karamon is a fine building of the Momoyama period. In the shrine is the Hōkoku Festival by Kanō Naizen Shigesato (1570–1616), a six-part folding screen, painted in color on paper.

Kenninji: Founded by the priest Eisai in 1202. The original buildings, with the exception of the Chūmon, were destroyed by fire and rebuilt about the middle of the 18th century. In the temple are a pair of two-part folding screens of the Wind God and the Thunder God (PL. 314) in color on gold, attributed to Tawaraya Sōtatsu (early 17th cent.).

Shōrenin: The present buildings date from 1895. Here is found a painting in color on silk of Fudō Myōō (Fujiwara period).

Yogenin: In this temple are Pine Trees, painted on sliding doors, and Cypress Trees, painted on wooden doors, attributed to Tawaraya Sōtatsu (early 17th cent.).

Yasaka Shrine (commonly called Gion Shrine): The present buildings date from 1654; the Honden (sanctuary) is noteworthy.

Seisuiji (popularly known as Kiyomizudera). The present structures were erected in 1633 by order of Tokugawa Iemitsu; the main hall is outstanding (PL. 311).

Rengeōin (popularly known as the Sanjūsangendō): This temple was first built in 1132 by order of Emperor Goshirakawa and was rebuilt in 1251, after having been destroyed by fire in 1249. The Hondō (Kamakura period) is long and narrow, as it was designed to house 1,000 statues of Senju Kwannon; it is the longest wooden building in Japan. The seated wooden statue of Senju Kwannon (Kamakura period) is a representative work of Tankei, son of Unkei. Other standing wooden statues include the Nijūhachi-bu-shu, representing the 28 faithful followers of Kwannon (Fujiwara and Kamakura periods), and the Wind God and the Thunder God, both of the Kamakura period.

Chishakuin (or Chijakuin): Headquarters of the Chizan school of the Shingon sect. It was rebuilt by Tokugawa Ieyasu in 1598, and houses 51 paintings of flowers in color on gold paper on sliding doors and walls (PL. 319); these are typical examples of the gorgeous decorative panel paintings of the Momoyama period. There are also three folding screens of Pine Trees and Autumn Grasses in color on gold paper of the same period.

Manshūin (or Manjūin): This temple contains paintings in color on silk of Fudō Myōō (Fujiwara period), widely known as the "Yellow Fudō" because the god's body is painted in that color, and Monkeys (Sung dynasty).

Shūgakuin palace: This was built for Emperor Gomizuno-o (1596–1680) by Tokugawa Hidetada (1579–1623). Its garden, nearly 70 acres in area, is one of the most beautiful in Japan.

Jishōji (popularly known as Ginkakuji): Originally built in 1489 by Ashikaga Yoshimasa. The two-storied Ginkaku (Silver Pavilion) was modeled on the Kinkaku. In the Buddha hall is an image of the Buddha by Jōchō (d. 1057). In the Tōgudō (tea-ceremony hall; Muromachi period) is a tiny tearoom, which is the model for all the later rooms used for the tea ceremony.

Konkaikōmōji: Belongs to the Jōdo sect. Here is a painting in color on silk of Amida Appearing Over the Mountains (Kamakura period).

Nanzenji: A famous temple of the Rinzai sect. It was founded in 1293 but twice destroyed by fire; some buildings erected by Tokugawa Ieyasu remain. The two-storied Sammon was built in 1628. The Hōjō (Momoyama period) was originally the Seiryōden of the imperial palace in Kyoto; the 63 paintings on the sliding doors and walls were done by Kanō Eitoku and other artists of the Kanō school. The smaller suite of apartments attached to the Hōjō was transferred from the Fushimi castle; the painting of Tigers in gold leaf on the sliding screens is attributed to Kanō Tanyū. The temple also contains a Daruma (Dharma; Muromachi period) by Keishoki, painting in ink on paper, and the Hermit Yao Shan Talking to the Poet Li Po

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

(Southern Sung dynasty; III, PL. 264) by Ma kung-hsien, painting in ink and faint color on silk. The Konchiin has a tea-ceremony house known as Hassoseki (Momoyama period). In the Konchiin are the following paintings: Autumn Landscape and Snow Landscape, in color on silk, attributed to Hui-tsung (1082–1135); Hut in the Valley (known as the Keiin Shōchiku), in ink on paper, attributed to Minchō; Landscape with Pavilion at Lake, by Kanō Motonobu (1476–1559), in ink on paper; and Monkeys and Pine Trees, both of the Momoyama period, painted on sliding doors in ink on paper.

Zenrinji (also known as Eikandō): This was rebuilt during the 15th century. Here there is a painting in color on silk of Amida Appearing Over the Mountains (Kamakura period; PL. 293) and the Yūzūnembutsu Engi (Muromachi period), two scrolls illustrating stories concerning the origin of the Yūzūnembutsu sect of Buddhism.

Shinshō Gokurakuji: This contains a painting in color on paper of Fūgen Bosatsu (Samantabhadra; Kamakura period) and the Shinnyodō Engi (Muromachi period), three scrolls illustrating legends of the origin of the Shinnyodō.

Anrakujuin: This temple contains a seated wooden statue of Amida (Fujiwara period).

Daigoji: A famous temple of the Shingon sect, founded in 874 by the priest Shōbō. The five-storied pagoda, built in 951, is decorated with beautiful paintings on wooden panels dating from the same time as the building. The Yakushidō (Fujiwara period) contains wooden statues of the Yakushi Triad (Fujiwara period) and 39 Buddhist iconographic drawings in ink on paper (Fujiwara and Kamakura periods). In the Kōdaiin is a painting of Monju Crossing the Ocean (Kamakura period; PL. 297) in color on silk. The museum of the temple, the Daigoji Reihōkan, contains paintings, sculptures, historical manuscripts, and sutras.

Sambōin: A celebrated temple of the Shingon sect, founded by the abbot Shōkaku in 1115. The Karamon and the landscape garden, one of the finest in Japan, are of the Momoyama period. In the temple are two pairs of two-fold screens by Tawaraya Sōtatsu (early 17th cent.), one showing Bugaku dancers and the other with painted fans pasted on the screen; a painting of Kishi-bojin (Hāritī; Fujiwara period) in color on silk; and a Fudō Myōō of painted wood by Kaikei (PL. 345).

Hōkaiji: This temple of the Shingon sect is of the 10th century. In the Amidadō (probably 11th cent.) is a seated wooden statue of Amida attributed to Jōchō (d. 1057).

Ryūanji (or Ryōanji): Founded in 1473 by Hosokawa Katsumoto. It is famous for its garden (Muromachi period; PL. 448) with its unique rock-and-sand formation and absence of trees, the work of Soami.

Myōshinji: The temple was built between 1336 and 1338 on the site of the imperial villa of Emperor Hanazono, but the present monastery buildings are of the Edo period. The Myōshinji has three pairs of six-fold screens of the Momoyama period: Kin Ki Sho Ga and Flowers, both by Kaiho Yūshō, and Monkeys (PL. 309), by Hasegawa Tōhaku. No other Buddhist temple has as many dependent temples as the Myōshinji; notable among these are the Taizōin, containing a typical specimen of black-ink painting of the Muromachi period, Catching a Catfish with a Gourd (PL. 305), by Josetsu; the Reiunin, containing 49 Landscapes and Flowers and Birds (PL. 357), by Kanō Motonobu (1476–1559); and the Tenkyūin, with a painting on sliding doors of Birds and Plum Trees, attributed to Kanō Sanraku (1559–1635).

Hokongōin: It contains a seated wooden statue of Amida (Fujiwara period).

Ninnaji: Belongs to the Shingon sect and was founded in 886 by Emperor Kōkō. The Kondō (Momoyama period) contains an Amida Triad (Jōgan period), seated wooden statues. The five-storied pagoda was built in 1637. The Mieidō (portrait chapel; Momoyama period) contains the Kujaku Myōō (Mahāmayūri; Sung dynasty), a painting in color on silk. Other works of art of the Heian and later periods are also kept here.

Kōryūji (better known as Uzumasadera): This belongs to the Shingon sect, and was originally founded in 622 by Hata Kawakatsu to house a statue of the Buddha given to him by Prince Shōtoku Taishi. The lecture hall in its present state dates from 1165 and contains a seated wooden statue of Amida and a standing wooden statue of Jizō Bosatsu, both of the Jōgan period. The main hall of the Keigūin, built in 1251, contains a seated wooden Miroku in meditation (Asuka period), which is a masterpiece of wooden sculpture of the 7th century, and standing wooden statues of the Jūni Shinshō (PL. 272), made by Chōsei, a famous Buddhist sculptor, in 1064.

Kōzanji: Here are kept four famous scrolls in ink on paper of Animal Caricatures (PL. 287; III, PL. 435; IV, PL. 282; X, PL. 255) by Kakuyū [Toba Sōjō (1053–1140)]; a painting of the Butsugen Butsumo (Kamakura period), in color on silk; a painting in color on paper of Myōe Shōnin (Kamakura period); and six scrolls of the Kegon Engi (Kamakura period), in color on paper, illustrating the history of the Kegon sect. In the past these scrolls were attributed to Fujiwara-no-Nobuzane (13th cent.), but they are in fact the work of members of the community.

Jingoji: Founded in 824 but allowed to fall into ruin for 200 years and rebuilt in the 12th century. The Yakushi, a standing wooden statue, is a representative work of single wood-block sculpture of the late 8th century. The Godai Kokūzō, seated wooden statues, are typical specimens of Buddhist sculpture of the 9th century. The temple also contains a pair of *sansui byōbu* (Kamakura period), six-fold screens in color on paper; portraits said to be of Minamoto Yoritomo, Fujiwara Mitsuyoshi (PL. 290), and Taira-no-Shigemori, all of the Kamakura period, painted in color on silk, which are among the best portraits of lay persons of the Kamakura period; a Two Worlds Mandara (Jōgan period), in gold and silver on purple silk; and a Shaka (Fujiwara period; PL. 276), in color on silk.

Saihōji (popularly known as Kokedera, Moss Temple): Belongs to the Rinzai sect. The garden was designed by Musō Kokushi (1275–1351) and is a typical example of a "scenery garden," in which famous scenes are reproduced. The ground is completely covered with moss. In the garden is the Shōnantei (Momoyama period), a tea-ceremony house.

Matsunoo Shrine: Dedicated to the Shinto god Ōyamakui-no-Mikoto and his consort. Here are three seated wooden statues (two gods and one goddess; PL. 273) of Shinto deities (Jōgan period), which are among the oldest and finest examples of Shinto sculpture, and a painting in color on silk of Fūgen Emmyō (Vajrāmoghas-mayasattva; IV, PL. 225) of the Kamakura period.

Seiryōji (commonly called Shakadō): In the main hall is a standing wooden statue of Shaka (Sung dynasty), brought to Japan in 987 by the priest Chōnen; this is the prototype of the Seiryōji type of Shaka that was frequently copied in the Kamakura period. In a recent examination models of viscera were discovered inside this statue.

Tenryūji: Founded in 1339 by Ashikaga Takauji. The present buildings were reconstructed in 1900 after repeated damage by fire. Of particular interest is the garden, designed by Musō Kokushi, who was also the first superior of the temple.

Daikakuji (or Daigakuji): Originally a residence of Emperor Saga, it was turned into a temple in 876 by Emperor Junna. Peonies and Pink Prunus Blossoms, paintings on sliding doors, in color on gold paper, are both of the Momoyama period. The Godai Myōō in wood are by Meien (Myoen; Fujiwara period).

Katsura palace: A beautiful mansion in the *sukiya* style of architecture with a "scenery garden" (PL. 448). Originally designed and built by Prince Tomohito between 1617 and 1626, it was enlarged by Prince Tomotada ca. 1645. Buildings include the Koshoin, Chūshoin, and Shinshoin (old, middle, and new *shoin*), and two tea-ceremony houses, the Gepparō and Shōkintei (PL. 115).

Kiyomizu: Center of production of Kiyomizu ware, which is famous for its elegance. Ceramic manufacture began in this area in the mid-15th century, when a potter named Otowaya Kuroemon opened a factory here. With the increasing popularity of the tea ceremony, the region thrived on the manufacture of tea-ceremony articles. In the 17th century the famous potter Nonomura Ninsei originated Kyoto ware, which is still made in enormous quantities.

Kyoto National Museum: Here is housed a vast collection of paintings (PL. 317), sculpture, handicraft arts, calligraphy, historical manuscripts, and archaeological specimens belonging to the museum, as well as objects on loan from shrines, temples, and private collectors.

Yūrinkan Museum: Contains specimens of ancient Oriental art.

Municipal Modern Art Gallery: This gallery displays contemporary arts: Japanese-style and Western-style paintings, decorative works of art, and sculpture. From time to time the museum holds exhibitions of contemporary art.

Ōhara. Village 4 miles north of Kyoto. The Sanzenin was rebuilt in 860 by the priest Jōun. The main hall, known as Ōjōgokurakuin (hall of paradise in rebirth), was built in 985 and contains wooden statues of the Amida Triad (Fujiwara period.)

Kurama. Village 6 miles north of Kyoto. The Kuramadera, founded in 770 by the priest Kantei, stands on the peak of Mount Kurama; its present buildings, however, date only from 1872. Here are wooden statues of Shō Kwannon (Āryavalokiteśvara; Kamakura period) by Jōkei, a Sung-style work with intricate drapery, and of Bishamonten (Fujiwara period).

Mukōmachi. Village 4 miles from Kyoto. In the Hōbōdaiin is a seated wooden statue of Gakkō in meditation (Jōgan period), showing the influence of the later T'ang dynasty art of China.

Otokuni. Village near Kyoto. In the Chōhōji is the Resurrection of the Buddha (Fujiwara period; PL. 275), in color on silk, a typical example of graceful Buddhist painting of the late 11th century.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Uji. Small town 3 miles south of Kyoto on the railway line to Nara. Nearby are a number of temples of distinct artistic and historical interest.

Mampukuji: Headquarters of the Ōbaku sect. The temple was founded in 1659 by the priest Ingen. It contains a painting of Lake Hsi-hu by Ike-no-Taiga (1723–76) and five other paintings of the Edo period.

Ujigami Shrine: The Honden (Fujiwara period) is the oldest and most typical example of the *nagare* style of Shinto architecture. The Haiden is of the Kamakura period.

Byōdōin: Originally a villa built ca. 1000 for Fujiwara Michinaga, it was converted into a Buddhist temple in 1052 by Fujiwara Yorimichi, who built the Hōōdō (Phoenix hall; PL. 284) in 1053. The Hōōdō is one of the most beautiful specimens of architecture of the period; it contains a seated statue of Amida (Fujiwara period) attributed to the famous Buddhist artist Jōchō, which is the prototype of the Jōchō style of Buddhist sculpture. While earlier statues used to be carved out of a single block of wood, this is made by the joined-wood technique invented by Jōchō, in which each part of the statue is carved separately and all the parts subsequently joined. Above the Amida is a wooden canopy (Fujiwara period). Admirable also are the figures of worshippers (Fujiwara period; PL. 272), 52 heavenly beings flying on clouds, sculptured in wood and fixed to horizontal supports near the ceiling on the inside of the building.

c. Prefecture of Osaka. Osaka. Capital of Osaka prefecture, its foundation can be dated back to the 4th century, when the emperors Ōjin and Nintoku decided to build their palaces here. The place where Osaka now stands was originally called Naniwa ("rapid waves"), and this name is still used in poetry. In the 16th century, with the reign of Toyotomi Hideyoshi, Osaka became a great commercial city, mainly because of its port, and it continued to grow throughout the era of the Tokugawa Shogunate. Despite its long history, Osaka has few places of artistic or archaeological interest.

The mint building, belonging to the period immediately after 1870, was designed by an Englishman, T. J. Waters, and shows the eclecticism then current in European architecture. Tōgo Murano's Sogō Department Store (1936), Tetsurō Yoshida's Central Post Office (1939), and the Sports Stadium (1955) are outstanding examples of modern architecture. There are three important museums in Osaka: the Municipal Art Museum, with a permanent display of ancient Oriental art (ceramics, lacquer, Buddhist sculpture, paintings, etc.) in the northern part of the building and contemporary works of art in the southern part; the Nihon Kōgeikan, with Japanese handicrafts and contemporary decorative arts; and the Fujita Museum of Art, containing 3,000 specimens of painting, sculpture, calligraphy, and decorative arts, as well as a fine collection of objects connected with the tea ceremony.

Shitennōji: Originally founded in 593 by Prince Shōtoku Taishi, it was repeatedly burned down, rebuilt in 1812, but razed to the ground in World War II. It gives its name to the Shitennōji type of temple plan, used in many temples, consisting of the inner gateway, pagoda, main hall, and lecture hall standing in a straight south-north line. Among the temple treasures are the fan-shaped Saddharmapuṇḍarīka Sūtra (PL. 286), famous for its beautiful paintings in color, and a seated bronze statue of Kwannon in meditation (Asuka period).

Osaka castle: Built in 1583 by Toyotomi Hideyoshi, and destroyed by Tokugawa Ieyasu in 1615. The Tokugawas began reconstructing the castle in 1620 as a base from which to control the western regions of Japan and finished it in 1630, but it was abandoned after the Meiji Restoration (1868).

Sakai. Lying south of Osaka along the coast, this is the second largest city of the prefecture. Nearby is the tumulus of Emperor Nintoku, the largest (1620 ft. long) of the "keyhole-shaped" tumuli; it is believed to date from the 5th century, which would indicate that the imperial court in Yamato was firmly established at the time. The Koganezuka tumulus (Great Burial period) is also a "keyhole-shaped" tumulus 280 ft. long; in and near the wooden coffin in the burial chamber were found various funeral offerings, including a mirror decorated with gods and animals, dated 239.

Kawakami. In this village is the Kanshinji, a monastery of esoteric Buddhism, said to have been founded in 836 by Jitsue, a disciple of Kūkai. In the main hall (Muromachi period; PL. 310) are a seated wooden statue of Nyoirin Kwannon, a representative specimen of esoteric Buddhist sculpture of the first half of the 9th century, and three small bronze Buddhist statues (Asuka period).

Amano. Village south of Osaka. In the main hall (Kamakura period) of the Kongōji are a pair of screens of Landscapes with Sun and Moon (Muromachi period), in color on paper, an early specimen of the type of decorative painting that flourished in the Momoyama and Edo periods.

Takawashi. In the village is Yoshimura House, a fine example of a commoner's dwelling of the Edo period.

Hanyū. Near the village is the Yachūji, containing a seated bronze statue of Miroku in meditation, an important specimen bearing the date of 666.

Domyōji. In the village is the Domyōji, containing a Jūichimen Kwannon (Jōgan period), an excellent specimen of so-called "sandalwood sculpture" that flourished in the late 8th to 9th century. Nearby is the Kōfuku site (Jōmon period), which has yielded pieces of early to middle Jōmon earthenware, Yayoi earthenware, stone implements, etc. Also in this area is the tumulus of Emperor Inkyo (Great Burial period), a huge "keyhole-shaped" tumulus.

Nagano. Small town southeast of Osaka. The Kanshinji Reihōkan contains numerous objects of art of the Asuka and later periods.

d. Prefecture of Shiga. Otsu. Capital of Shiga prefecture, the city is 6 miles east of Kyoto on Lake Biwa. The city, which was the seat of the imperial court in the 2d century and again in the 7th, is chiefly a tourist center, but it also has buildings of artistic worth.

The Shiga Kenritsu Sangyō Bunkakan (Institute of Culture and Industry of Shiga prefecture) contains works of art from temples, shrines, and private collections in the prefecture. Otsu-e is a type of folk painting that has been produced in the Otsu area since the Edo period. It was originated by Iwasa Matabei (1578–1650), a painter of the Tosa school. These souvenirs are interesting for their rough but expert brushwork.

Onjōji (also called Miidera). Founded in 686 in memory of Emperor Kōbun and a center of the Tendai sect. Of the hundreds of buildings that at one time were within the temple precincts only a few remain that are worthy of note. The Ōmon (front gate) and three-storied pagoda are of the Muromachi period. The main hall (Momoyama period) contains a painting in color on silk of Fudō Myōō, popularly known as the "Yellow Fudō" because of the color of the god's body, and seated wooden statues of Shiragi Myōjin and Chisō Daishi, all of the Jōgan period. The *shinden* of the Emmanin is of the Momoyama period. In the Emmanin are Peacocks and Peonies by Maruyama Ōkyo (1733–95), painted in color on silk; Scenes at Sumiyoshi Shrine (Momoyama period), sliding panels in color on gold paper; and Genre Scenes (Momoyama period), four sliding doors in color on gold paper.

Ishiyama. Small town 1½ miles south of Otsu. The Ishiyamadera was founded by the priest Rōben in 749 and rebuilt in the 12th and 16th centuries. Noteworthy are the main hall (Heian period) and the Tahōtō (Kamakura period; PL. 285). The temple houses the Ishiyamadera Engi (Kamakura period), seven scrolls in color on paper, illustrating legends about the origin of the Ishiyamadera.

Iwane. In this village is the Zensuiji, containing a standing bronze statue of the Birth of the Buddha (Nara period) and wooden statues of the Yakushi Triad (Fujiwara period).

Shigaraki. Town 16 miles south of Otsu. Shigaraki pottery is produced here. This ware became famous during the Muromachi period with articles made for the tea ceremony, and Shigaraki ware is still manufactured here.

Sakamoto. Small town 2 miles north of Otsu. Nearby, on Mount Hiei, is the Enryakuji headquarters of the Tendai sect, founded in 788 by the priest Saichō by order of Emperor Kammu. Its buildings, though mostly reconstructed in the Edo period, retain an earlier Chinese style. In the Komponchūdō (original main hall; Edo period) is a standing wooden statue of Senju Kwannon (Jōgan period).

Minami Tominaga. In the village is the Kwannondō (also called the Toganji), containing a standing wooden statue of Jūichimen Kwannon (Jōgan period).

e. Prefecture of Mie. Ise. Small town on the Kii Peninsula on Ise Bay, composed of Uji and Yamada, formerly two separate towns but now a single municipality. Nearby is the Great Shrine of Ise, one of the oldest Shinto shrines. Because the sanctuary is rebuilt every 20 years, the present building is a new one, but it retains the high-floored style of architecture of ancient Japan.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

825

Yokkaichi. Port on the shore of Ise Bay. Banko pottery is produced here. Banko ware was originated about 1736 in the Kuwana area nearby, and was manufactured in Yokkaichi from the Meiji era on. This enameled porcelain is decorated with exotic motifs.

Awa. In the village is the Shin-Daibutsuji, containing a seated wooden statue of the priest Shunjō (Kamakura period).

f. Prefecture of Wakayama. Kōyasan. East of Wakayama, capital of the prefecture, is Kōyasan or Mount Kōya (near the village of Kōya), where there are a number of architectural complexes.

Kongōbuji: Headquarters of the Shingon sect. The temple was founded in 819 by Kūkai, but owing to repeated fires most of the original buildings no longer exist. Except for the Fudōdō and the sutra repository, both of the late Fujiwara period, the present buildings were erected in the early modern period. Most of the treasures of the temple are exhibited in the Reihōkan (treasure house; built in 1921). In the Kongōbuji are found a painting of the Nehan (Parinirvāṇa, or Death of the Buddha; II, PL. 378), in color on silk, dated 1086, a notable example of the graceful Buddhist work of the period; Shaka and His Host (Jōgan period), carved in relief on the inside of a cylindrical box consisting of three panels of wood, which is said to have been brought from China by Kūkai and is possibly a T'ang work; standing wooden statues of the Hachidai Doji (Eight Messengers of Fudō Myōō; Kamakura period), attributed to Unkei; Kujaku Myōō by Kaikei (PL. 345); and a lacquered sutra box (PL. 288).

Myōōin: Here is kept a famous painting of Fudō Myōō (Jōgan or possibly Kamakura period), in color on silk, popularly known as the "Red Fudō."

Ryūkōin: This contains a painting in color on silk, the Senchū Yūgen Kwannon (Fujiwara period), said to be the image of Kwannon as he appeared over the boat to Kūkai during his voyage from China to Japan.

Junji Hachimankō group of monasteries: Here is kept an Amida Raigō painting (Fujiwara period). The believers in the paradise of Amida, who were numerous in the Heian period, thought that Amida, accompanied by his attending *bosatsu*, would come down from heaven to receive the soul of the faithful at the moment of death. These "coming to welcome" (*raigō*) scenes were frequently represented in painting, and the finest and most famous of this type of painting is the one on Mount Kōya. Also kept here are the Godai Rikiku (Five Awesome Divinities; Heian period), three paintings of the five originals, in color on silk (PL. 274).

Henjōkōin: In the temple are sliding screens of Sages in a Mountain Retreat by Ike-no-Taiga, probably painted ca. 1761 or 1762.

Negoro. Village east of Wakayama, noted for the production of Negoro lacquer ware. This originated in the Negorodera, a monastery founded in 1288 by priests from Mount Kōya; it is one of the representative lacquer wares of Japan.

Yada. Village 37 miles south of Wakayama. Near here is the Dōjōji. The main hall (Muromachi period) contains standing wooden statues of Senju Kwannon, Gakkō, and Nikkō, all of the Jōgan period, and the Dōjōji Engi (Muromachi period), two scrolls, in color on paper, illustrating legends of the origin of the Dōjōji and the moral relating to it.

Nachi. Village in the southernmost part of Kii Peninsula, with the highest waterfall in Japan (PL. 299). The Kumano-Nachi Shrine was founded in the 4th century. From ancient times this shrine was the center of mountain worship, and it flourished especially during the Heian period and later, owing to the spread of *honji-suijaku*, the concept that Buddhist and Shinto deities were identical, one manifesting the other.

Shingu. Town close to Nachi. The treasure hall of the Kumano-Hayatama Shrine contains objects of art produced in the Heian and later periods (PL. 420).

g. Prefecture of Hyogo. Kobe. Capital of Hyogo prefecture. When Kobe was opened to foreign trade in 1868 it was a fishing village. Close to Kobe was the port of Hyogo, a very ancient city. Gradually Kobe increased in importance and in 1889 it was granted a city charter with Hyogo incorporated into it. In recent years Kobe has expanded considerably, absorbing villages and outer suburbs into the urban area. The city is divided into eight wards, and the town plan is extremely complicated because of the irregularity of the street system.

The prevailing style of architecture is Western. Worthy of note are the Town Hall by the architect Nikken Sekku Komu (1955) and the Central Post Office (1956). Kobe has two important museums: the Kobe Municipal Art Museum, containing numerous specimens of *namban* art and decorative arts, and the Hakutsuru Art Museum, containing Chinese bronzes, ceramics, mirrors, silverwork, objects from archaeological sites in Japan, and decorative arts.

Ono. Near this village is the Jōdoji, a monastery founded by the priest Chōgen (d. 1206) on the site of a temple originally founded by the priest Gyoki (668–749). The Jōdodō (Kamakura period) is a specimen of Tenjikuyō, the so-called "Indian" style but actually of southern Chinese origin, introduced by Chōgen. It contains wooden statues of the Amida Triad (Kamakura period).

Shimosato. Village northwest of Kobe. The three-storied pagoda (Muromachi period) of the Ichijōji contains ten paintings in color on silk of Prince Shōtoku and the Forefathers of Tendai Buddhism (Fujiwara period) and two standing bronze statues of Kwannon (Asuka period).

Kakogawa. Small town west of Kobe on the Kobe-Moji railway line. In the Kakurinji is the Taishidō (Fujiwara period), with wooden statues of the Shaka Triad (Fujiwara period); the Jōgyōdō (Fujiwara period); and the main hall (Muromachi period), with a standing bronze statue of Kwannon (Nara period). The temple also functions as a museum, preserving objects of art of the Asuka and later periods.

Himeji. City 34 miles west of Kobe. North of the city is Himeji castle (PL. 311), also called Rojō or Hakurojō. The three-storied tower was built by Toyotomi Hideyoshi in 1580; the five-storied donjon and other buildings were constructed about twenty years later by Ikeda Terumasa. Himeji is the most beautiful Japanese castle still existing. The main donjon is five-storied, and the west, northwest, and east towers are three-storied; all are of the Momoyama period.

Shosha. Village 7½ miles from Himeji, on the slopes of Mount Shosha. On the summit of the mountain stands the Enkyōji, founded in 988 by the priest Shōku, which contains wooden statues of the Shaka Triad (Fujiwara period).

Kamigōri. Region west of Kobe. The Nishinoyama tumulus (Great Burial period) is located here, a round mound ca. 56 ft. from south to north and ca. 10 ft. high.

CHUGOKU AND SHIKOKU DISTRICTS. *Historical outline.* Chugoku district, which consists of the five prefectures of Tottori, Shimane, Okayama, Hiroshima, and Yamaguchi, is located at the western end of Honshu. Shikoku district, with the four prefectures of Kagawa, Tokushima, Kochi, and Ehime, is on the opposite side of the Inland Sea, parallel to Chugoku. Because the two districts belong to the same general cultural sphere, they are discussed here together.

Sites of the pre-Jōmon period have recently been discovered in these districts, but details about them have not yet been published. Sites of the Jōmon period are found along the coast of the Inland Sea and in Shimane prefecture on the coast of the Sea of Japan. In the Yayoi period the coastal plains, suitable for farming, were rapidly cultivated; earthenware pieces of this period belong to a type intermediate between the types of northern Kyushu and Kinki district. Bronze culture was introduced to Japan in this period, and archaeological finds in this district, notably bronze mirrors and swords which are believed to have been imported from the continent, prove that the bronze civilization spread from the western to the eastern regions of Japan.

In the Great Burial period, however, the spread of culture tended to move in the opposite direction, the influence of Kinki district being very strong in this area. Tumuli are found scattered in various parts of Chugoku and Shikoku. While the Kibi area abounds in groups of tumuli consisting of large mounds squared in front and rounded in back ("keyhole-shaped"), as in the Yamato area, and small round mounds, in the Izumo area another type of tumulus, squared in front and squared in back, is represented; this indicates that the two areas formed different cultural spheres. Three Buddhist temples of the Asuka period exist in Okayama prefecture, located near Kinki district, and in Ehime prefecture, on the coast of the

UP State Museum, Lucknow

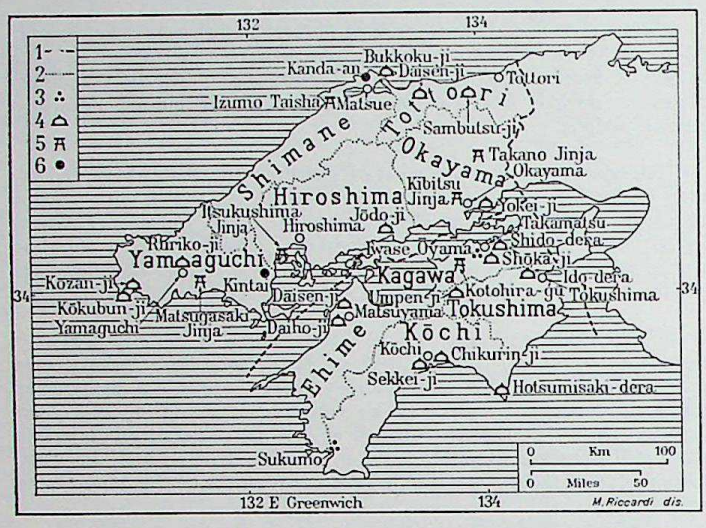
Inland Sea, which was an important means of communication in former times. Even in the Nara and Heian periods these places were ready to receive cultural influence from Kinki district, as is attested to by the number and at times the high quality of the early works of art. One of the chief activities of the culture in this area from the ancient to the medieval period was the art of making swords, notably in the Kibi area of Okayama prefecture.

In the medieval period the Ōuchi family, ruling the fief in what is now Yamaguchi prefecture, eager to assimilate the metropolitan



Chugoku (north) and Shikoku (south) districts. *Key*: (1) District boundaries; (2) prefecture boundaries; (3) archaeological sites and tumuli; (4) Buddhist temples; (5) Shinto shrines; (6) secular buildings of historic interest.

culture from Kyoto, invited weavers, printers, and other craftsmen from Ming China to encourage industry in their fief. Some of the masterworks by Sesshū were born as a result of the patronage with which the Ōuchis favored this great *suiboku* painter. In the early modern period the political center moved to the Kanto district, which began to absorb the culture of Kinki district, and Chugoku and Shikoku became, culturally, somewhat backward, as they are to this day.

Regions and centers of artistic interest. a. Prefecture of Tottori. Oyama. In this village, not far from Mount Daisen, stands the Daisenji, founded in 718. All the buildings were destroyed by fire, and only a few structures now remain. In the Amidadō (Muromachi period) are wooden statues of the Amida Triad (Fujiwara period), as well as two Buddhist statues (Asuka period) in bronze whose style attests to the existence at that time of contact with Korea.

b. Prefecture of Shimane. Matsue. Capital of Shimane prefecture, on the edge of Lake Shinji. Here is Matsue castle, built by Horio Yoshiharu between 1596 and 1610, and the Kandaan, an elegant tea-ceremony house with a beautiful sand garden, built by Matsudaira Fumai, lord of Matsue.

Mihonoseki. Village at the southeastern extremity of Shimane Peninsula, northeast of Matsue. Here is found the Sarugahana cave, where late Jōmon earthenware pieces have been discovered, and the Bukkokuji, containing a seated wooden statue of Yakushi and a standing wooden statue of Kwannon, both of the Jōgan period.

Wanibuchi. Village near Izumo. The Gakuenji was founded toward the end of the 6th century. The Kwannon in the temple has an inscription to the effect that it was cast in 692 in Izumo province.

Taisha. Village 4½ miles north of Izumo, near which stands the Great Shrine of Izumo. This locality has been a center of Shinto religion from prehistoric times. The sanctuary, built in the style of ancient residential architecture, is dedicated to Okuninushi-no-Mikoto. The present shrine was rebuilt in 1874. The treasure hall contains paintings, sculpture, decorative arts, manuscripts, archaeological specimens, and objects connected with religious ritual.

c. Prefecture of Okayama. Okayama. Capital of the prefecture and the cultural center of Chugoku district. Near the town is the Korakuen, a landscape garden laid out in 1786 by Ikeda Tsunamasa, lord of Bizen. The Kanakurayama tumulus (Great Burial period) is "keyhole-shaped" and 540 ft. long.

Magane. Village to the west of Okayama. Near here is the Kibitsu Shrine founded by Emperor Nintoku in the 4th century. The shrine is an ancient center of culture in this area and is dedicated to Kibitsuhiko-no-Mikoto, son of Kōrei, the seventh emperor. The sanctuary was rebuilt in 1485. The two-storied hall of worship is of the Muromachi period.

Tsuyama. City 36½ miles north of Okayama. The Takano Shrine contains two wooden statues of the Zuijin, Shinto deities who guard the doors of the shrine, carved in 1162.

d. Prefecture of Hiroshima. Hiroshima. Capital of the prefecture, it was destroyed by the first atomic bomb August 6, 1945. Among recently constructed buildings is the Memorial Peace Center (begun 1951; X, PL. 428) by Kenzō Tange, Takashi Asada, and Sachio Otani.

Itsukishima. A small island in the Inland Sea just off the coast; also called Miyajima. The Itsukushima Shrine is dedicated to the three daughters of the Shinto deity Susano-o-no-Mikoto. The shrine, of ancient origin, whose existence is recorded as far back as 811, was deeply revered by Taira-no-Kiyomori, who became virtual dictator in the 12th century. Restored by the Taira clan, it was burned down twice, reconstructed in 1241, and repaired during the Muromachi and Momoyama periods. The shrine is a unique specimen of architecture, built extending into the sea. Near the five-storied pagoda (Momoyama period) is the treasure hall, containing works of calligraphy and decorative arts of the Fujiwara and later periods. The 33 scrolls of the Heike-no-kyō (or Taira sutras) illustrate the Hoke-kyō (or Lotus Sūtra), and were done between 1164 and 1167 by members of the Taira family and donated to the shrine. Other treasures include a *hiōgi*, or fan made of strips of cypress wood (Fujiwara period), decorated with colorful paintings and said to have been donated by the Taira family; nine wooden Bugaku masks (Fujiwara period); a lacquered box for the Heike-no-kyō with an ivy design in *maki-e* (Momoyama period); and armor with dark blue lacing and with light blue lacing (Fujiwara period).

e. Prefecture of Yamaguchi. Yamaguchi. The capital of Yamaguchi prefecture was founded in the 14th century and came under the domination of the Ōuchi family. Many magnificent temples were built in imitation of those of Kyoto. A type of lacquer ware, known as Ōuchi lacquer, has been produced here since the Edo period.

Rurikoji: The five-storied pagoda is of the Muromachi period.

Hase Kwannondō: Here is kept a standing wooden statue of Jūichimen Kwannon (T'ang dynasty or Jōgan period), carved in the "sandalwood sculpture" style introduced from China.

Joeiji: This temple has a fine garden, said to have been designed by Sesshū (1420–1507), on a piece of land belonging to the Ōuchi family but detached from their main property.

Shimonoseki. City at the most southwesterly point of Honshu, on Shimonoseki Strait, which separates this island from Kyushu. Here is the Kokubunji, containing the Anchin Mandara (Fujiwara period), painted in color on silk, and a seated wooden statue of Fudō Myōō (Jōgan period). The museum at Chōfu contains specimens relating to local cultural history.

Bōfu (or Hōfu). Bōfu, southeast of Yamaguchi on the southern coast of the prefecture, is a single municipality made up of Mitajiri and Miyaichi. The Matsugasaki Shrine (also called the Miyaichi Temmangū) is dedicated to Sugawara-no-Michizane, a Shinto saint. Here is kept the Matsugasaki Tenjin Engi (Kamakura period), six scrolls in color on paper, illustrating the life of Michizane.

Iwakuni. A small town on the border between Yamaguchi and Hiroshima prefectures. It is famous for its bridge, the Kintai-bashi (also known as the Soroban-bashi), built in 1673 and characterized by its unusual arched form. The Iwakuni Chōkōkan, the municipal museum, contains examples of fine arts, minor arts and crafts, and objects illustrating the local history of the region.

Hagi. Town on the northern coast of the prefecture, noted for Hagi ceramics. This pottery was first produced at the beginning of the 17th century by Korean craftsmen and its tea-ceremony utensils are highly valued. Recent products of Hagi ware are generally limited to tableware.

f. Prefecture of Kagawa. Takamatsu. Capital of Kagawa prefecture and formerly the seat of the Matsudaira family. In the government factory of the Takamatsu fief a type of ceramics has been produced since 1694; it was called Takamatsu ware, but after the Meiji period the name was changed to Rihei ware.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Iwase Ōyama group of tumuli: These "keyhole-shaped" mounds (Great Burial period) exemplify the oldest tomb style of the period.

Ritsurin park: This is the site of the former mansion of the Matsudaira family. The area around South pond is said to have been laid out from ca. 1624 to 1628, the rest ca. 1673. In the park is a museum containing local objects of art; exhibitions of contemporary local arts are also held.

Shido. Village 10 miles east of Takamatsu. The Shidodera, a famous temple of the Shingon sect, was founded in the 17th century. It contains standing wooden statues of Jūichimen Kwannon with Two Attendants (Jōgan period).

Kotohira. Small town southwest of Takamatsu. The Kotohiragū (popularly known as Kompira-san) is dedicated to the Shinto god Ōmononushi-no-Mikoto. The treasure hall of the shrine contains specimens of historical painting, calligraphy, weapons, manuscripts, and paintings by Takahashi Yuichi (1828–94). In the shrine are a standing wooden statue of Jūichimen Kwannon (Fujiwara period); a scroll painting illustrating the Nayotake Monogatari (Kamakura period), in color on paper; and paintings on sliding doors of Landscapes, Figures, and Animals by Maruyama Ōkyo (1733–95).

Nio. Near the village is the Kotsutajima shell mound, a kitchen midden from which pieces of stamped earthenware from the early Jōmon period have been excavated.

g. Prefecture of Kochi. Sukumo. Village in the extreme south of the prefecture, southwest of Kochi, the capital of Kochi prefecture. Here is the Sukumo shell mound, a kitchen midden of the Jōmon period.

Godaisan. In the village is the Chikurinji. The main hall (Muromachi period) contains a wooden statue of Mahātejas (Fujiwara period).

Muroto. Village 55 miles southeast of Kochi on the Muroto promotory. At the tip of the promontory is the Hotsumizakidera (also called Tōji), founded by Kūkai. Here is a seated stone statue of Nyoirin Kwannon in meditation (Fujiwara period), a rare and fine example of stone sculpture.

Nagahama. In this village is the Sekkeiji. The temple contains standing wooden statues of Bishamonten and Two Attendants (Kamakura period), representative works of Tankei, son of Unkei. The statue of Kichijōten, one of the attendants, clearly shows the influence of Chinese Sung art. Also in the Sekkeiji are wooden statues of the Yakushi Triad (Kamakura period).

h. Prefecture of Ehime. Matsuyama. Capital of Ehime prefecture and one of the principal cities of Shikoku district. Since about 1818 a cotton fabric with double-woven splashed patterns (*kasuri*), called Iyo *kasuri*, has been produced here.

Daihoji: In the main hall (Kamakura period) are seated wooden statues of Amida and Shaka, both of the Fujiwara period.

Miyaura. Village on Ōmi-shima, an island north of Imabari. The Oyamazumi Shrine was founded in prehistoric times; its treasure hall contains armor, weapons, etc.

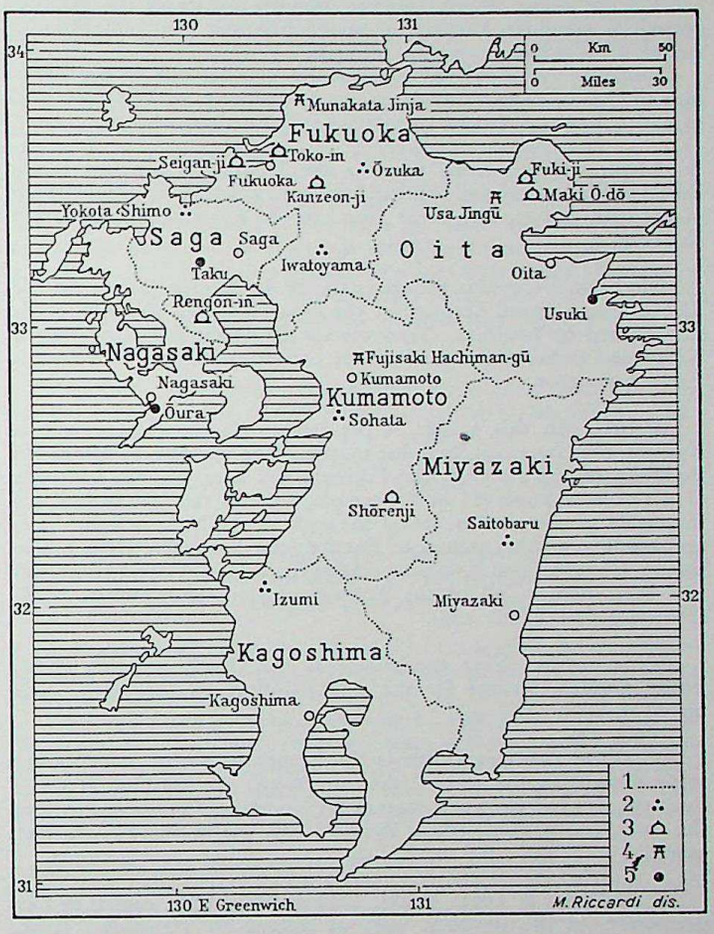
KYUSHU DISTRICT. *Historical outline.* Kyushu consists of the seven administrative prefectures of Fukuoka, Oita, Saga, Nagasaki, Kumamoto, Miyazaki, and Kagoshima, and of the Ryukyu (Luchu) Islands. The Jōmon culture was diffused in various parts of this district. Toward the end of the Jōmon period the eastward spread of the power of the Chinese Han dynasty and the willingness of the people in Kyushu to accept the new civilization made Kyushu the first district to develop the new Yayoi culture. Northern Kyushu in this period was the leading point of contact with foreign culture and the center of the newly introduced civilization. An interesting illustration of this fact is the gold seal excavated in 1784 at Shikanoshima in Fukuoka prefecture. It is engraved with five characters interpreted to mean "King of Nu State in Wa Country [Japan], Han dynasty," and is presumed to have been given to the ruler of a community in Kyushu in 57 A.D. by the Chinese emperor Kuang Wu-ti of the Eastern Han dynasty. Owing to the close cultural communication with the continent, the use of metal (bronze and iron) implements here made rapid progress.

The existence of tumuli with huge mounds built over the burial chambers seems to indicate that Kinki exercised a strong influence over Kyushu during the Great Burial period. From then on, cultural supremacy passed from Kyushu to the Yamato area. However,



Kyushu district. *Key*: (1) Prefecture boundaries; (2) archaeological sites and tumuli; (3) Buddhist temples; (4) Shinto shrines; (5) secular buildings of historic interest.

Kyushu still retained some of its distinctive cultural characteristics in the Great Burial period, such as the wall paintings in burial chambers. Honshu also has a considerable number of tumuli with wall paintings, but those in Kyushu are far superior in quality as well as quantity.

Kyushu was the first place in Japan to receive Western civilization, and this was one of the most important events in its history. When Portuguese ships began to visit Japan they were enthusiastically welcomed by the feudal clans in this district, who were suffering from a grave economic crisis and were barely able to maintain themselves by trading with China and Korea. European ships, besides offering the possibility of increased trade, brought the first Christian missionaries to Japan. Under the influence of Western art a new type of painting, termed "Western-style" painting, was born at this time, and it gradually spread to Kinki and more easterly regions. In 1587 Toyotomi Hideyoshi banned Christianity, and the succeeding Tokugawa government followed his example. In 1614 the Tokugawas adopted a policy of isolating Japan from other parts of the world, so that Western influence gradually decreased. Later on, trade with the Netherlands alone was permitted at Dejima in the port of Nagasaki, and this became the only door open to Western civilization. The Nagasaki school (q.v.) of realistic painting began here. After the Meiji Restoration in 1868, the policy of national isolation was abandoned and Japanese arts were greatly influenced by the West.

Kyushu district is noted for its ceramics. Sakaida Kakiemon (or Kakiemon I), a great potter who was active in the first half of the 17th century, is credited with introducing the technique of

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

enameling to porcelain. The manufacture of porcelain has continued to the present day; the area around Arita, in particular, is one of the ceramic centers of Japan (see CERAMICS).

Regions and centers of artistic interest. a. Prefecture of Fukuoka. Fukuoka. The capital of the prefecture was the scene of violent warfare between 1274 and 1281, when Kublai Khan's Mongolian hordes attempted to invade Japan. Takatori pottery, a type of ceramics originated by Korean potters in the early 17th century, is still made in Fukuoka.

Tokoin: This temple contains wooden statues of the Fujiwara period: a standing Yakushi; a seated Yakushi; the Juni Shinshō, standing, of which only nine remain.

Seiganji: Here is kept a miniature pagoda, one of the 84,000 iron models of pagodas made in 955 by the kings of Wu-Yüeh state in China and distributed to temples in China and abroad.

Yame. In this small town is the Iwatoyama tumulus (Great Burial period), a "keyhole-shaped" tumulus 476 ft. long. Stone figures of humans, horses, etc., were found in the soil covering the burial chamber.

Maebaru. Near this village is the Shito dolmen (Yayoi period). The dolmens found here are of the type known as *shisekibo*, tombs surmounted by boulders. They are similar to the burial mounds of Korea and indicate the existence of communications with Korea in the remote past.

Mizuki. In this village is the largest Buddhist monastery in Kyushu, the Kanzeonji, founded in 709. The existing buildings and Buddhist statues are from the Fujiwara and later periods, but some of the objects preserved in the temple, such as the bronze bell and fragments of clay statues, reveal the style of the Nara period. They are standing wooden statues of Fukūkenjaku Kwannon, Batō Kwannon or Horse-headed Kwannon (Hayagrīva), Daikokuten (Mahākāla), and Bishamonten, all of the Fujiwara period, and Bugaka masks (Fujiwara period; PL. 278).

Katsuragawa. Near the village is the Ōzuka tumulus (Great Burial period), famous for the wall paintings in the stone burial chamber.

Nodajima. In this village is the Munakata Shrine, containing a stone stele with the text of the Amida-kyō engraved on it (Sung dynasty), and two pairs of statues of the Koma-inu (lion-dogs guarding the gate), one of stone (Sung dynasty) and one of wood (Kamakura period).

b. Prefecture of Oita. Usuki. City south of Oita, capital of Oita prefecture, in the southern part of Saganoseki Peninsula. About 3 miles from Usuki is Fukuda, where over 50 images of the Buddha (Fujiwara period), the finest and largest in Japan, are carved in relief on the cliffs.

Kunisaki. Village north of Oita on the eastern coast of Kunisaki Peninsula. Near here is the Ankokuji site where archaeological remains of the Yayoi period have been found.

Usa. Village north of Oita on the west coast of Kunisaki Peninsula. The Usa Shrine has been a center of Shinto worship from very ancient times, though the date of its original founding is unknown. The shrine (Edo period) is a typical example of the Hachiman type of Shinto architecture: there are two similar and connected buildings, each with a gabled roof, and the front runs parallel to the ridgepole. The shrine contains five wooden statues of Shinto deities (Fujiwara period).

c. Prefecture of Saga. Karatsu. Port northwest of Saga, capital of Saga prefecture. Karatsu pottery (see CERAMICS) is produced in Karatsu and the surrounding territory. There have been ceramic kilns in this area since the late Kamakura or Muromachi period. They were abolished for a certain period, but after Toyotomi Hideyoshi's expedition to Korea (1592–98) the production of Karatsu ware was resumed under the guidance of Korean potters. Today the chief products are utensils for daily use.

Arita. Village west of Saga, known for Imari ware, which is produced in and around Arita. Enameled porcelain has been made here since the early Edo period (see CERAMICS), and this is still one of the great centers of ceramic manufacture in Japan.

Sebuno. Near this village is the Mitsu site, dating from the Yayoi period.

d. Prefecture of Nagasaki. Nagasaki. Capital of the prefecture, situated on the west coast of Kyushu. Of interest here is the Catholic church Ōura Tenshudō. Christianity was prohibited in Japan after 1587, but after the signing of an agreement in 1858 the authorities allowed Christian churches to be constructed for foreigners living near Japanese ports. The Ōura Tenshudō was built between 1862 and 1864 by two French Jesuits and was the first Western church erected in Japan. Though improved and enlarged in 1874, it retains the form of the Gothic-style architecture of the time. The museum contains a collection of material relating to local history at the time of Japan's opening of communication with foreign countries, in particular with the introduction of Christianity and of trade relations with China and the Netherlands.

Orioze. Village near Nagasaki, where Hirado pottery is produced. Hirado ware, originated by Korean potters in the late 16th century, is characterized by elaborate pieces in celadon and white porcelain. This is still one of the important ceramic centers in Kyushu.

e. Prefecture of Kumamoto. Kumamoto. Capital of the prefecture, on the west coast of Kyushu. The city contains various buildings of historic and artistic interest. Kumamoto castle was built by Katō Kiyomasa, lord of the Kumamoto region, between 1601 and 1608. Only the stone foundations and a few towers and gateways remain. The treasure hall of the Hommyōji contains works of art from the Zentsūji and manuscripts and objects that belonged to Kiyomasa.

Kikusui. In the village is the Funayama tumulus (Great Burial period), a "keyhole-shaped" tumulus ca. 154 ft. long. Swords with silver inlay and other fine works of art have been excavated here.

Kurohiji. In this village is the Shōrenji. The Amidadō (Kamakura period) contains wooden statues of the Amida Triad (Kamakura period).

f. Prefecture of Kagoshima. Kagoshima. Capital of the prefecture, on the west coast of Kagoshima Bay facing Sakurajima Peninsula. The museum contains paintings by Kuroda Kiyoteru (1866–1924), an artist from this area, and other contemporary works of art.

Ōshima. Island in southern Kagoshima. Made here is Ōshima *tsumugi*, a distinctive type of silk fabric with a double-woven splashed (*kasuri*) pattern. This fabric was originated in the early 1700's and is still produced today.

Ijūin. Village a few miles west of Kagoshima, famous for Satsuma pottery (see CERAMICS), which has been produced since the Edo period. Satsuma ware is the collective term for all ceramics produced in Kagoshima prefecture. A speciality of Satsuma ware is porcelain with a brocaded pattern, known as Satsuma *nishikide*.

BIBLIOG. Kanzeonji Taikyō (Complete Catalogue of the Treasures of the Kanzeonji), Tokyo, 1934; Fukuoka-ken Jūyō Bunkazai Kaisetsu (Guide to the Important Cultural Properties in Fukuoka Prefecture), Fukuoka, 1952.

CHUBU DISTRICT. *Historical outline.* Chubu district is divided into nine prefectures: Aichi, Shizuoka, Gifu, Nagano, Yamanashi, Fukui, Ishikawa, Toyama, and Niigata. Situated between the Kinki and Kanto districts, Chubu is characterized by its mixed culture, inspired by both eastern and western Japan. Pre-Jōmon sites are found at Chausuyama in Suwa-guni, at Babadaira and Nobeyama in Minami Saku-gun, and at Nojiriko in Kami Minochi-gun, all in Negano prefecture. Future excavations will no doubt bring forth other centers of this period.

The important vestiges that the Jōmon period has left in this district reveal different characteristics according to the areas where they were found. About the middle of the Jōmon period Chubu, together with Kanto district, appears to have been one of the most thriving areas in Japan. Earthenware pieces include some particularly valuable specimens showing the effects of contact between the Jōmon-type pottery from the east and the Yayoi-type pottery from the west.

The Yayoi period has also left numerous traces. Highly decorative pieces of earthenware with "combed" patterns have been unearthed in the Tōkai area, that is, the region along the Pacific coast. Metal implements such as bronze spears, halberds, and bells (*dōtaku*) have also been found. Chubu is the most northerly region of bronze culture in Japan.

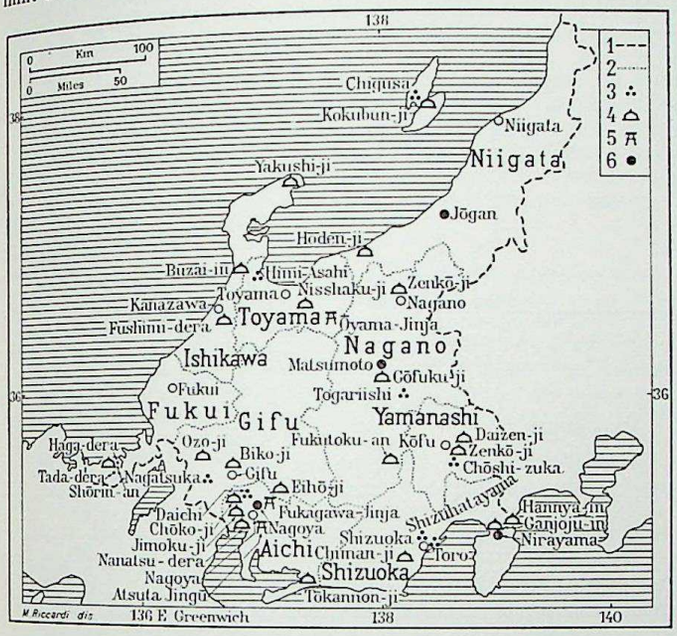
The district has many monuments of the Great Burial period. The tumuli are of various types, from the most primitive kind to the "keyhole-shaped" type, and often as enormous as those in the Yamato area. Ornaments showing strong continental influence have been excavated from some of the tumili.

No Buddhist temple remains datable to the Asuka period have

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

been discovered in this district, but there are vestiges of several Kokubunji, the provincial temples built in the 8th century by imperial order. The influence from Kinki distrinct was strong in the western part of Chubu; its eastern part was largely influenced by Kanto. In Buddhist sculpture the Yakushi Triad in the Yakushiji, Ishikawa prefecture, and the dry-lacquer statue of Jūichimen Kwannon in the Jimokuji, Aichi prefecture, are examples of the style current in the 7th and 8th centuries in this district; no statues of this type have been found in the regions situated to the east of those mentioned. Specimens of *nata-bori* (roughly finished wood carving retaining chisel marks on the surface), which thrived chiefly in Kanto district, have survived in the eastern part of Chubu; the western limit of their distribution is the line connecting the Tōkannonji and



Chubu district. *Key*: (1) District boundaries; (2) prefecture boundaries; (3) archaeological sites and tumuli; (4) Buddhist temples; (5) Shinto shrines; (6) secular buildings of historic interest.

Chōrakuji in Aichi prefecture and the Hodenji in Niigata prefecture. This line may also be considered to divide the eastern and western cultural spheres of Chubu.

The most notable artistic production of the medieval period was the ceramic ware made in Seto and the vicinity. The origin of the ceramic industry in this area dates back to the Fujiwara period, and from then on it has supplied pottery and porcelain of good quality to all parts of Japan. The word *setomono* ("Seto goods") is still used as a general term for ceramics in Japan.

Chubu produced many powerful military lords in the early modern period, including the Tokugawa family, which ruled Japan for 250 years. Nagoya castle is one of the monuments that best illustrate the importance of this district.

Regions and centers of artistic interest. a. Prefecture of Aichi. Nagoya. This city is the capital of Aichi prefecture and is located on Ise Bay. It was founded in the 16th century. Nagoya contains buildings of historic and artistic interest, as well as museums.

Atsuta Shrine: This Shinto shrine was founded in the 2d century. Here are kept the Hoke-kyō (Fujiwara period), a scroll on paper decorated with paintings in color, and 11 wooden Bugaku masks (Fujiwara and Kamakura periods).

Nanatsudera (also called Chōfukuji): This temple was founded in 735 in the village of Nanatsudera and transferred to its present site in 1611. It contains seated wooden statues of Kwannon and Seishi (Mahāsthāmaprāpta), both of the Fujiwara period; these are early examples of the technique of using inlaid pieces of crystal for the eyes.

Nagoya castle: The castle, begun in 1610 and completed in 1612, was built by Tokugawa Ieyasu. It was destroyed in 1945 but was recently reconstructed. The numerous paintings on the sliding doors had been removed before the bombing and were not damaged; they were painted by members of the Kanō school.

Jimokuji. Village near Nagoya. The temple of the same name has a Nandaimon of the Kamakura period. The statue of Jūichimen Kwannon (Nara period; the lower half is a later restoration) is in dry lacquer; this statue is the most easterly example of dry lacquer in Japan. The Jimokuji also contains two paintings in color on silk: Fudō Myōō (Fujiwara period) and Nehan (Kamakura period).

Ōsato. In this village is the Chōkoji. Here is kept an iron statue of Jizō Bosatsu (Kamakura period). Many Buddhist statues were made of iron during the Kamakura period, chiefly in eastern Japan; this is a typical specimen. Also in the Chōkoji is a portait of Oda Nobunaga (1583) by Kanō Motohide (PL. 352).

Iwakura. Village near which is the Daichi site (Yayoi period). Earthenware of the Yayoi type inspired by the Jōmon style was discovered here, as well as ruins of dwellings.

Seto. City ca. 13 miles northeast of Nagoya, and one of the most important ceramic centers in Japan (see CERAMICS). Pottery with wood-ash glazing was produced in and around Seto as early as the Fujiwara period. In 1223 Katō Shirōzaemon (commonly called Tōshirō) went to China to study pottery techniques, and on his return he introduced a new type of glazed pottery by adding iron to the glaze; this is known as *amekusuri* ("caramel glaze," that is, dark brown or black iron glaze). The Seto ware of the Momoyama and early Edo periods is outstanding. The Seto Ceramic Ware Exhibition Hall contains numerous antique and modern examples of Seto pottery and porcelain.

Tokonabe. Small town on the Chita Peninsula. Tokonabe pottery has been produced in this vicinity since the Heian period. During the Kamakura period the ware was unglazed and with very simple decoration, but in the Edo period the Tokonabe ceramics reached a high level of technical elaboration. Utensils for everyday use are still made here.

Futagawa. Near this village is the Tōkannonji. The two standing wooden statues of Bishamonten (Fujiwara period) preserved here are the most westerly examples of *nata-bori* sculpture.

b. Prefecture of Shizuoka. Shizuoka. Capital of the prefecture, Shizuoka is situated on the delta of the Abegawa River. There are two important archaeological sites, both ca. 1 mile from the city.

Toro: This is the site of an excavated hamlet of the Yayoi period. The ruins of houses and other buildings are remarkably well preserved. Many articles for daily use and jewelry have been unearthed.

Shizuhatayama tumulus: In the precincts of the Sengen Shrine is this round tumulus from the later part of the Great Burial period.

Ōtsu. In this village is the Chimanji. The temple contains a standing wooden statue of Senju Kwannon and a wooden box with Amida and His Heavenly Host carved in relief, both of the Fujiwara period.

Mishima. This town is the entrance to Izu Peninsula. The museum of Mishima Shrine contains treasures of the Kamakura and later periods (PL. 419).

Nirayama. Village on Izu Peninsula. Nearby is the Ganjojuin, with a seated wooden statue of Amida (Kamakura period).

Izusan. Spa on the east coast of Izu Peninsula 1 mile from Atami. The Hannyain contains a seated wooden statue of the Shinto god Izusan Gongen (Kamakura period).

c. Prefecture of Gifu. Gifu. Capital of the prefecture. The Bikoji contains a dry-lacquer statue of Jūichimen Kwannon (Nara period), originally in a temple in Mie prefecture.

Yokokura. Near this village is the Ozoji. In the temple are kept a seated wooden statue of Yakushi (Kamakura period); a wooden relief, called the Hokke Mandara (Fujiwara period); a seated wooden statue of Rushana Butsu (Kamakura period); and a standing wooden statue of a guardian god of Buddhism, Jinja Taishō (Fujiwara period).

Tajimi. Small town 21 miles south of Gifu. The Eihōji was founded by Soseki (Musō Kokushi) between 1312 and 1317. Buildings include the two-storied Kwannondō (Kamakura period) and the Kaisandō, or founder's hall (PL. 310), built in 1352, a typical example of Karayō architecture. The garden is of the Kamakura period. In the Eihōji is a painting of Senju Kwannon (Sung dynasty), in color on silk.

d. Prefecture of Nagano. Nagano. Capital of the prefecture. The Zenkōji, founded in 664, has a two-storied main hall that was reconstructed in 1726.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Matsumoto. City south of Nagano. In Shiroyama Park are the remains of Matsumoto castle, built by Ishikawa Yasumasa in the late 16th century. This is a valuable example of castle architecture, preserving its original appearance fairly well.

Kataoka. Near this village is the Gōfukuji (or Ushibushidera), containing wooden statues of the Fujiwara period of Jūichimen Kwannon, standing; Fudō Myōō, standing; and Shaka, seated.

e. Prefecture of Yamanashi. Kōfu. Capital of Yamanashi prefecture. The Zenkōji contains two groups of the Amida Triad in wood (Fujiwara period), transferred here from the Zenkōji in Nagano.

Katsunuma. Village east of Kōfu. The two-storied main hall (Kamakura period) of the Daizenji contains a Yakushi Triad (Jōgan period).

Chudō. Village near Kōfu. The Chōshizuka tumulus (Great Burial period), a "keyhole-shaped" tumulus 446 ft. long, is located here.

f. Prefecture of Fukui. Obama. Town on the coast of Wakasa Bay, southwest of Fukui, capital of Fukui prefecture. The Tadadera in Obama contains wooden statues of Nikkō, Gakkō, and Yakushi (Jōgan period), and the Shōrinan has a seated bronze *bosatsu* in meditation (Nara period). Wakasa lacquer, named for the province in which Obama is located, has been produced since the early 17th century and is characterized by colorful designs.

g. Prefecture of Ishikawa. Kanazawa. Capital of Ishikawa prefecture. The Fushimidera contains a seated Amida, a fine and very rare example of bronze sculpture of the 9th century.

Kutani. Village southwest of Kanazawa. Kutani ware, one of the representative enameled porcelain wares of Japan (see CERAMICS), is produced here. Kutani ware originated in the mid-17th century (PL. 303); production was suspended until the 19th century, but the kilns are now active again.

Wajima. Village on the west coast of Noto Peninsula. Wajima lacquer has been produced since the first half of the 19th century; it is characterized by its durable quality as well as by an elaborate decorative technique known as *chinkin*, or hairline engraving filled in with gold leaf.

h. Prefecture of Toyama. Ōiwa. In the village is the Nisshakuji, containing five groups of Buddhist images, carved in relief on the cliff, the largest being that of Fudō Myōō, nearly 10 ft. high.

Takaoka. City west of Toyama. The museum contains modern Japanese and Western paintings, sculpture, and handicrafts by local artists.

i. Prefecture of Niigata. Itoigawa. Village southwest of Niigata, capital of Niigata prefecture. The Hodenji contains a standing wooden statue of Jūichimen Kwannon (Fujiwara period).

Mano. Village on Sado Island. The Kokubunji contains a seated wooden statue of Yakushi (Jōgan period).

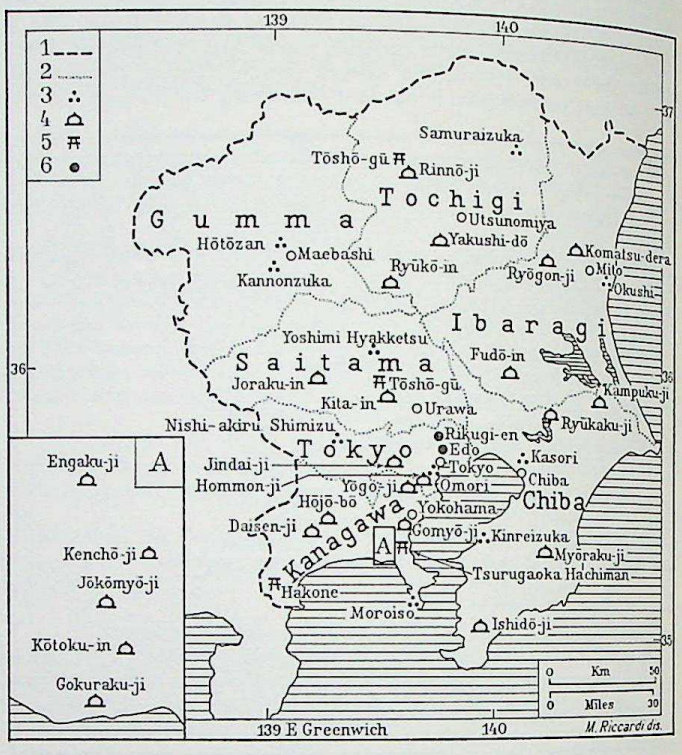
KANTO DISTRICT. *Historical outline.* Kanto district comprises the six prefectures of Kanagawa, Chiba, Saitama, Gumma, Tochigi, and Ibaraki, and the Tokyo Metropolitan Area. Iwajuku in Gumma prefecture was the first place where a pre-Jōmon site was discovered. Kanto must have been a paradise for the Jōmon-period people, judging by the existence of numerous important sites of the period. During the Yayoi period Kanto had a cultural life that was very different from that of western Japan. The scarcity, if not the nonexistence, of bronze implements, which by this time were widely diffused in all the western regions of the country, is noticeable in Kanto. Earthen-



Kanto district. *Key*: (1) District boundaries; (2) prefecture boundaries; (3) archaeological sites and tumuli; (4) Buddhist temples; (5) Shinto shrines; (6) secular buildings of historic interest.

ware of the Yayoi period retains many elements of the Jōmon period. Earthenware intermediate between the Jōmon and Yayoi types occurs, as has been shown, in Chubu district, but it is much more conspicuous in Kanto district. Contact with Kinki district was, perhaps, stronger in Kanto than in Chubu. The number of tumuli here is considerably larger than in other districts. The area around what is now Gumma prefecture was the cultural center of the district during the Great Burial period. In this prefecture there are more than 8,000 tumuli, 370 of which are of the "keyhole-shaped" type.

During the 7th and 8th centuries this district was all but a dependency of the Yamato court. The arts were directly imported from the Yamato area, as is demonstrated by examples still existing, such as the Buddhist statues in the Ryūkakuji at Ajiki, in Chiba prefecture, and the Jindaiji in Tokyo. After the 9th century, however, the inhabitants of Kanto began to develop a more independent character. Their arts were crude but original, as exemplified by *nata-bori* sculpture. The military lord Minamoto Yoritomo triumphed in the civil wars of the 12th century and established his military government at Kamakura. Kanto was thus no longer isolated, although in the early part of the Kamakura period Kyoto still remained the center of artistic life. From the middle of the Kamakura period, under the influence of Chinese Sung art, Kanto seems to have produced original types of art.

Most of the Ukiyo-e artists and many of the "literati" painters lived and worked in Edo, and various other schools of art were also born here. With the Meiji Restoration in 1868 the Tokugawa feudal government relinquished national rule. Emperor Meiji made Edo the capital of Japan and renamed it Tokyo. The constitutional government abolished the policy of national isolation previously adopted by the Tokugawas.

Regions and centers of artistic interest. a. Prefecture of Kanagawa. Yokohama. This city is the capital of Kanagawa prefecture and lies on the west coast of Tokyo Bay. It was here, in 1854, that Commodore Perry landed to deliver a letter from the President of the United States. Yokohama was opened to foreigners in 1859.

In 1923 Yokohama was almost totally destroyed by an earthquake and subsequently rebuilt according to principles of modern

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

town planning. The center of the city was reserved almost entirely for office quarters, with buildings in the Western style.

Yokohama was again rebuilt after World War II. It is divided into 10 wards. In the past few years architecture has been oriented toward the international style. Notable modern examples are the library and municipal auditorium, built in 1954 and designed by Kunio Maekawa, and the prefectural office by Kenzō Tange (1958).

Gumyōji: This is the oldest Buddhist temple in the city. It contains a standing wooden statue of Jūichimen Kwannon (Fujiwara period). This statue, together with the Yakushi Triad in the Hōjōbō at Takabeya, is one of the oldest examples of *nata-bori* sculpture.

Shōmyōji: The temple was founded by Kanazawa Akitoki. It contains a seated bronze statue of Aizen Myōō (Rāga; Kamakura period); a standing wooden statue of Shaka (Kamakura period); and portraits of Kanazawa Sanetoki, Kanazawa Akitoki, Kanazawa Sadaaki, and Kanazawa Sadatoki, all of the Kamakura period, in color on silk.

Kanazawa Bunko (library): The library was founded in 1275 by Kanazawa Sanetoki, a member of the Hōjō family of Kamakura; it was then part of the Shōmyōji precincts. The present library was brought together in 1930 and contains Japanese and Chinese books collected by Sanetoki during the Kamakura period, as well as works of art from the Kamakura and Muromachi periods that were preserved in the Shōmyōji.

Kamakura. Famous city on Sagami Bay in the northern part of Miura Peninsula. Kamakura became capital of Japan in 1192, when Minamoto Yoritomo established his government there, and it remained the seat of government until 1333. During this period and in the following one, which lasted from 1335 to 1573 under the Ashikaga Shogunate, the city reached a high degree of prosperity, and a great number of temples and art treasures remain, particularly in the historic part of the city.

Kōtokuin: In the temple precincts is a seated bronze statue of Amida (PL. 301), known also as the Great Buddha of Kamakura. This beautiful work of art was cast in 1252 by Ōno Gorōemon, one of the greatest sculptors of the time and the most celebrated in the region.

Gokurakuji: Founded in 1113 in the village now called Fujisawa, the temple was moved in 1259 to its present site. It contains a statue of Shaka and standing wooden statues of the Jūdai Deshi, all of the Kamakura period.

Tsurugaoka Hachimangū: The shrine was founded in 1063 by Minamoto Yoriyoshi on another spot and moved to its present location in 1191. It is dedicated to Emperor Ōjin. In the shrine is a seated wooden statue of Benzaiten (Kamakura period). The treasure hall contains objects of art of the Kamakura and later periods.

Kamakura Kokuhōkan (Kamakura Art Museum): The museum houses numerous objects of art from the Kamakura and Muromachi periods on loan from shrines, temples, and private collectors in Kamakura and the neighboring areas.

Kakuonji: The temple was founded in 1218 by Hōjō Yoshitoki. It contains a standing wooden statue of Jizō Bosatsu (Kamakura period).

Zuisenji: In the Kaisandō is a seated wooden statue of the priest Soseki (Kamakura period), who founded the temple in 1327.

Jōkōmyōji: The temple contains wooden statues of the Amida Triad (Kamakura period), typical specimens of a new style of Buddhist sculpture that arose in this period under the influence of Chinese Sung art.

Engakuji: This great monastery of Zen Buddhism was built in 1282 by Hōjō Tokimune. The two-storied Shariden (relic hall; PL. 284) is an outstanding example of Karayō architecture. In the Engakuji area are a seated wooden statue of the priest Bukko Kokushi (Kamakura period); a Nehan (Kamakura period), painting in color on silk; paintings of 23 rakan (arhats), traditionally attributed to the Chinese painter Chang Ssŭ-kung; and the rakan Badara (Muromachi period), painting in ink and faint color on paper, attributed to Sōen.

Tōkeiji: The temple was founded in 1284 by the widow of Hōjō Tokimune. It contains a wooden statue of Kwannon (14th cent.), which shows the influence of Chinese art of the late Sung period. The decorative patterns on the robe of this statue are executed in a technique peculiar to this area, the so-called "relief coloring," consisting of a mixture of colors and clay.

Meigetsuin: Contains a seated wooden statue of Uesugi Shigefusa (Kamakura period; PL. 294), a typical piece of secular portrait sculpture.

Kenchōji: This Zen monastery was built in 1253 by Hōjō Tokiyori for the Chinese priest Tai Chaio, known in Japan as Daigaku Zenji. It contains many fine works of art: the Jūroku Rakan (Sixteen Rakan), eight paintings in ink and faint color on silk, attributed to Minchō (also called Chōdensu; 1352–1431); Shaka Triad, painting in color on silk, attributed to the Chinese painter Chang Ssŭ-kung; a portrait of Daigaku Zenji (Muromachi period), in color on silk, with an inscription by Daigaku Zenji; and a seated wooden statue of Hōjō Tokiyori (Kamakura period). The garden is of the Edo period.

Yokosuka. City south of Kamakura on the east coast of Miura Peninsula. The Tado site and the Natsushima shell mound, both of the Jōmon period, are located here.

Ōyama. Village northwest of Kamakura at the foot of Mount Ōyama. Nearby is the Daisenji, containing Fudō Myōō and Two Messengers (Kamakura period), fine examples of the iron statues frequently made during the Kamakura period, chiefly in Kanto district.

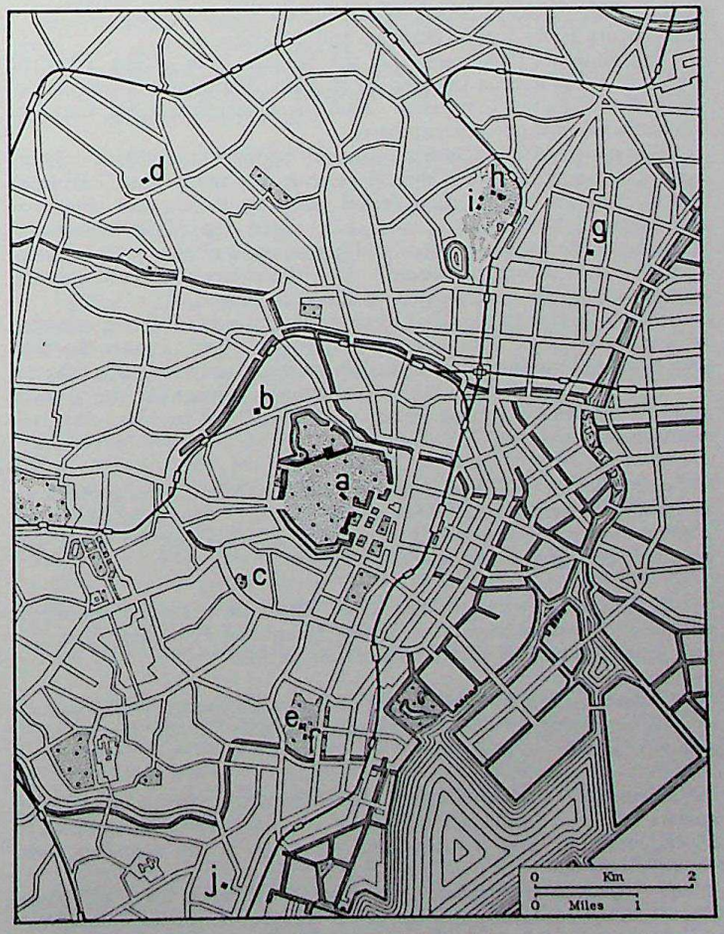
Takabeya. In the village is a small monastery, the Hōjōbō. The statues of the Yakushi Triad are considered to date from the last part of the 11th century, and are numbered among the oldest existing specimens of *nata-bori* sculpture. Also in the Hōjōbō are seated wooden statues of Amida and Yakushi (Kamakura period).

Moto-Hakone. Village on the eastern shore of Lake Ashi. The Hakone Shrine (popularly called the Hakone Gongen) is located at the foot of Mount Koma. It was founded in 757 by the priest Mangan, and is dedicated to three Shinto deities. The treasure hall of the shrine contains many rare works of art, among which are a seated wooden statue of Mangan (Jōgan period) and the Hakone Gongen Engi, a single scroll illustrating the origin of the shrine.

Miyagino. Village 4 miles north of Moto-Hakone. The Hakone Art Museum contains numerous examples of Oriental painting, sculpture, prints, and handicrafts.

b. Tokyo metropolitan area. Tokyo is the capital of Japan but does not have a very long history. In 1457 Ōta Dōkan built a fortress at Edo, as it was then called. In 1590 Tokugawa Ieyasu raised Edo to the status of capital of the eight provinces of Kanto, and from then on it grew rapidly in size and splendor. In 1787 it was one of the largest cities in the world, with almost a million and a half inhabitants. In 1868 it became the capital of Japan, and the name was changed to Tokyo.

Among the most important buildings constructed after 1868,



Tokyo, plan of the center of the city. (*a*) Imperial palace; (*b*, *c*, *f*) Shinto shrines: (*b*) Yasukuni Jinja, (*c*) Hie Jinja, (*f*) Tōshōgū; (*d*, *e*, *g*, *j*) Buddhist temples: (*d*) Gokokuji, (*e*) Zōjōji, (*g*) Higashi Honganji, (*j*) Sengakuji; (*h*) National Museum; (*i*) Metropolitan Fine Art Gallery.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

which reflect the eclecticism current in European architecture at the time together with elements taken from local tradition, are the Historical Museum by C. V. Cappelletti, the Rokumeikan Social Center by J. Conder, and the Law Court by A. Hartung.

The first buildings in reinforced concrete began to appear in Tokyo early in the 20th century, and after the earthquake of 1923 they became increasingly common. In the years before World War II new building methods, based on reducing the volume of walls by the use of reinforced concrete pylons and broad windows, began to be widely practiced. Buildings of great importance in this respect are Tetsurō Yoshida's Central Post Office (1931) and Mamoru Yamada's Communications Hospital (1937).

The attempt to combine the ancient quarter and the modern city has produced, in the most recent buildings, a new approach to the functional method, enriched by the study of different solutions of space problems, yet keeping the ties with traditional local architecture. Examples of recent architecture are the Readers Digest group of buildings, the Shinjō (temple), the Nippon Gekki building, the Metropolitan Office by Kenzō Tange (1956), Masachika Murata's International Trade Center (1959–60), Hirosi Hohe's Hōsei University (1954), and the Japanese Academy of Arts by Soya, Yoshida, and others (1960).

There are many museums and galleries in Tokyo; some of the outstanding ones are cited here. The National Museum consists of 20 rooms devoted to textiles, metalwork, swords, ceramics, lacquer, painting, sculpture, calligraphy, etc., from the prehistoric through the Edo period. The Hyōkeikan has eight rooms that at present display Japanese archaeological specimens. The exhibits (which are changed from 2 to 12 times a year) include the permanent collection as well as pieces lent or deposited temporarily by shrines, temples, and private collectors. Exhibitions take place every spring and autumn. The Metropolitan Fine Art Gallery holds exhibitions of contemporary Japanese arts throughout most of the year. The Kami Negishi Calligraphy Museum contains numerous specimens of calligraphy. Japanese and Chinese painting, sculpture, and handicrafts are exhibited in the Ōkura Shūkokan. The Nezu Art Museum has many examples of Oriental painting, calligraphy, sculpture, metalwork, swords, ceramics, lacquer, tea-ceremony articles, etc. In the Mingeikan (Folk Art Museum) are folk arts and crafts from all parts of Japan. The Bridgestone Gallery shows work by modern Western and Japanese artists. The National Museum of Modern Art contains examples of modern art from Japan, Europe, and America.

Hommonji: This temple is the headquarters of the Nichiren sect, and was founded in 1274 by Ikegami Munenaka, a follower of the priest Nichiren (1222–82). There is a seated wooden statue of Nichiren (Kamakura period) here.

Edo castle: Edo castle was originally built by Ōta Dōkan, military lord of the area, in 1457; later it became the dwelling of Tokugawa Ieyasu, founder of the Edo feudal government. It was improved and enlarged between 1624 and 1644. Since the Meiji Restoration it has been the imperial palace. Although most of the original buildings were lost owing to recurrent fires, the palace is a representative example of castle architecture of the Edo period.

Ōmori shell mound: This mound (Jōmon period) was discovered by Professor E. S. Morse, an American, in 1873. It was the first archaeological excavation made in Japan according to scientific criteria.

Jindaiji: Founded in 733, this temple belongs to the Tendai sect. It contains a bronze statue of Shaka (Nara period), seated in the Western manner.

c. Prefecture of Chiba. Ajiki. In this village is the Ryūkakuji, containing a seated bronze statue of Yakushi. The head is of the Nara period (the oldest piece of sculpture in Kanto); the body was restored during the Edo period.

Sawara. Port on the Tone River. Near here is the Kampukuji, with seated bronze statues of Shaka, Jūichimen Kwannon, Yakushi, and Jizō Bosatsu, all of the Kamakura period.

Chiba. This city is the capital of Chiba prefecture, and is located at the beginning of Bōsō Peninsula. Nearby is the Kasori shell mound (Jōmon period).

Mizusawa. In the village is the Myōrakuji, containing wooden statues (all of the Fujiwara period) of Dainichi Nyorai, seated; Fudō Myōō, standing; and Bishamonten, standing, in the *nata-bori* style.

d. Prefecture of Saitama. Kawagoe. Small town north of Tokyo. The Tōshōgū contains paintings of the "Thirty-six Poetic Immortals" in color on wood boards and framed, attributed to Iwasa Matabei (1578–1650). The Kitain was founded in 830 by Jikaku Daishi; it contains a pair of six-fold screens, on which are painted in color on paper Pictures of Crafts, attributed to Kanō Yoshinobu (1552–1640).

Yoshimi. Village north of Tokyo. Near here is a group of some 250 tombs in the form of caves dug in the side of a hill, known as Yoshimi Hyakketsu (Great Burial period).

e. Prefecture of Tochigi. Utsunomiya. Northwest of Utsunomiya, capital of Tochigi prefecture, is the Ōya-Kwannon temple, said to have been founded by Kūkai (Kōbō Daishi, 774–835). On the walls of the temple, built partly within a cave, are a group of Buddhist images carved in high relief (Fujiwara period).

Mashiko. Village south of Utsunomiya where Mashiko pottery is produced. Mashiko ware, originated about 1848, is simple and crude. The kilns in this vicinity still produce quantities of pottery rich in folkloristic interest.

Azuma. Village north of Utsunomiya. The Ryūkōin contains a wooden statue of Erasmus of Rotterdam, made in Amsterdam in 1598 and placed at the stern of the sailing boat Erasmus. The boat was confiscated in Japan and the statue alone survived.

Nikkō. Small mountain town, northwest of Utsunomiya. Nikkō is famous for its temples and the magnificent mausoleum of Tokugawa Ieyasu (1542–1616), founder of the Tokugawa Shogunate.

Tōshōgū Shrine: Ieyasu was buried at Nikkō in 1617, but it was not until 1634 that his mausoleum was begun; it was completed two years later. The architecture of the main shrine is of a style established in the late Momoyama period, consisting of a Honden, a Haiden located in front of it, and a passageway connecting the two. The Yōmeimon (gate of sunlight), popularly called the Higurashimon (twilight gate), is of the Edo period.

Rinnōji: This temple belongs to the Tendai sect and contains many statues and portraits.

Daiyūin: This is the mausoleum of Tokugawa Iemitsu, third Tokugawa Shogun; here is a standing wooden statue of Senju Kwannon (Fujiwara period).

Southwest of the Tōshōgū Shrine is the treasure hall, which contains antiquities from the shrines and temples in Nikkō.

Tohoku district. *Historical outline.* Tohoku (or Ou) district, situated at the northern end of Honshu, consists of six prefectures: Fukushima, Yamagata, Akita, Miyagi, Iwate, and Aomori. Recent discoveries have proved that a pre-Jōmon culture existed in this district. Earthenware of the Jōmon type found here is notable for its complicated decoration; the clay figurines, of grotesque appearance, are more numerous and of a superior quality in Tohoku than in other districts. Tools and implements of bone, horn, wood, etc., attest to the high cultural development achieved here in the Jōmon period, which might indicate that the Jōmon culture first appeared in Tohoku and spread later to Kanto and Chubu districts. Notable also among sites of this period are the stone circles at Ōyu in Akita prefecture. Several other sites of similar nature have been discovered in the district; presumably they are relics of the religious customs of the times.

Various sites existing in the district show that the Yayoi culture, which was born and developed in western Japan, reached the southern part of Tohoku not much later than in other districts. During the Great Burial period many tumuli were built, and they are found in all the prefectures except Aomori.

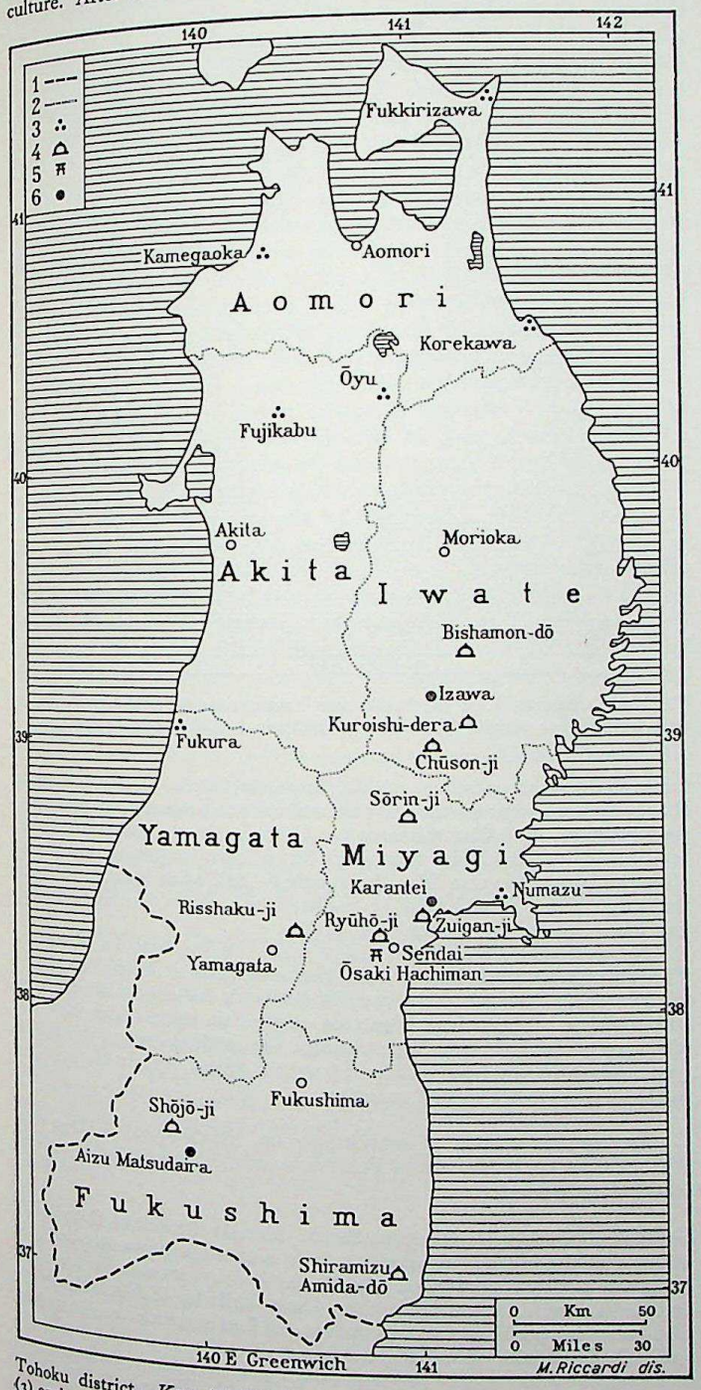
As late as the historic period Tohoku was still inhabited by a primitive tribe called the Ezo. According to a widely accepted theory, the Ezos were not an independent race but a local tribe which remained hostile to the central government. Even in the 7th and 8th centuries the Ezo community in the northern part of Miyagi was frequently in revolt against the Yamato court. Many priests and generals were sent by the court to subjugate the Ezos and to exploit the unclaimed regions. The official culture quickly took root in the

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

district, as is attested to by the existence of the ruins of a Kokubunji (official provincial temple built in each province by imperial order in the 8th cent.) in Miyagi prefecture.

In the 12th century the Fujiwara clan, a powerful family of the Ezo tribe, who controlled the regions around Iwate prefecture, created a short but brilliant period of prosperity; the Chūsonji, Mōtsuji, and Muryōkoin, famous in the cultural history of the district, were the direct result of the admiration of the Fujiwaras for the court culture. After the Fujiwaras were conquered by Minamoto Yoritomo



Tohoku district. *Key*: (1) District boundaries; (2) prefecture boundaries; (3) archaeological sites and tumuli; (4) Buddhist temples; (5) Shinto shrines; (6) secular buildings of historic interest.

in the Kamakura period, the central power reached the remotest parts of Tohoku, with the inevitable end of the local culture and the permeation of the civilization of the metropolis.

This situation remained unchanged in the early modern period. It is worth mentioning, however, that a school of Western-style painting, termed the Akita school, made its appearance in the Akita area in the 18th century. The lord of Akita, in the hope of increasing the production of his copper mines, invited Hiraga Gennai (1726–79) from the capital to advise him. Gennai, a man of inventive, progressive mind and with a knowledge of Western techniques, not only offered his help to the lord but also taught the elements of Western-style painting to the people of the area. The Akita school of painting flourished for a short period of time. Various other industries were encouraged, such as Aizu and Sōma ceramics, produced in Fukushima prefecture, and iron kettles (Nambu *tetsubin*) and lacquer ware (Nambu *nuri*), produced in Nambu province in Iwate prefecture. Although these forms of handicrafts are still active, generally speaking artistic activities have not thrived in Tohoku since the Meiji Restoration.

Regions and centers of artistic interest. a. Prefecture of Fukushima. Uchisato. In this small town is located the Shiramizu. The Amidadō, built in 1160, contains wooden statues of the Amida Triad, flanked by two standing wooden deities, all of the Fujiwara period.

Aizu-Wakamatsu. City southwest of Fukushima, capital of Fukushima prefecture. Aizu lacquer ware has been produced here since 1590, when the industry was founded by Gamo Ujisato, lord of Aizu.

Hongō. Aizu pottery has been made in this village since ca. 1644. At first only pottery was produced, but since ca. 1800 blue-and-white porcelain has been fabricated as well.

Shōjō. In this village stands the Shōjōji. It is not known when the temple was founded, but it probably existed by the 9th century. The dimensions of the main hall (Muromachi period) are very unusual for a building situated in a local district. In the Shōjōji are wooden statues of the Yakushi Triad (Jōgan period), important examples of eastern Japanese art which perpetuate several elements of the style of the Nara period; and standing wooden statues of Jūichimen Kwannon, Jizō Bosatsu, Kwannon, and the Shitennō, all of the Jōgan period.

b. Prefecture of Yamagata. Yamagata. Capital of the prefecture. The Risshakuji (also called the Yamadera) is 9 miles from Yamagata. The temple belongs to the Tendai sect and is said to have been founded in the 9th century by the priest Ennin. It contains the head of a statue of the priest Jikaku Daishi (Jōgan period) in wood.

Sakata. City at the mouth of the Mogami River. The Homma Art Museum contains examples of Oriental arts (manuscripts, ceramics, etc.) and of Western arts (paintings, prints, etc.).

c. Prefecture of Akita. Ōyu. Village in the northern part of the prefecture, near the boundary of Aomori prefecture. The Ōyu site is of the late Jōmon period. The site consists of large circles of stone disposed in groups; the eastern group is 158 ft. in diameter and the western one 148 ft.

d. Prefecture of Miyagi. Sendai. Capital of Miyagi prefecture. Date Masamune (1566–1636) was the daimio of the province in which Sendai is situated, and lived in Sendai castle.

Ōsaki Hachiman Shrine: The shrine was built in 1606. The main building is noted for its architectural beauty and richly decorated interior.

Ryūhoji: This temple contains a statue of Shaka (Kamakura period), which is the most northerly example of the Seiryōji type of Shaka statue.

Saitō Hōon Museum: Here are exhibited objects relating to the natural and cultural history of Tohoku district.

Matsushima. Village 10 miles north of Sendai in Matsushima Bay. There are over 800 small islands in the district of Matsushima.

Zuiganji: The temple was founded in 828 and rebuilt in 1609 by Date Masamune. The buildings, which are considered typical of the Momoyama period, include the Hondō, Onarimon (gate of honor), Nakamon (middle gate), Kuri, and Kairō (corridors).

Kanrantei (wave-viewing house): The Kanrantei, which was given to Date Masamune by Toyotomi Hideyoshi, is said to date from the end of the 16th century. The paintings of Flowering Plants on the sliding doors are attributed to Kanō Sanraku (1559–1635).

e. Prefecture of Iwate. Mizusawa. Small town south of Morioka, capital of Iwate prefecture. In the town are the ruins of Izawa castle, an important citadel built in 802 by Sakanoue-no-Tamuramaro, one of the military generals dispatched from the Yamato court to subdue the Ezo tribe; and the Kuroishidera, containing a seated wooden statue of Yakushi, dated 862.

Hiraizumi. Village south of Mizusawa. The famous Chūsonji (or Chūzonji) is the only reminder of the past glories of Hiraizumi, which the Fujiwara family ruled from ca. 1090 to 1189. The Chūsonji was founded in 1105 by Fujiwara Kiyohira. His successors Motohira and Hidehira enlarged the temple from 1108 on until it had more than 40 buildings, rivaling in size the great religious centers of Kyoto. The only original buildings remaining are the Konjikidō

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

(golden hall), also called the Hikarudō (glittering hall), and the Kyōzō. The Konjikidō was built in 1124, and was enclosed within a larger building in 1288 to preserve it; its was originally covered with gold leaf, and roofed with wooden blocks in the shape of tiles. The Kyōzō was built in 1108; originally two-storied, the upper story was destroyed by fire in 1216. Among the treasures kept in the temple are six bronze pendants or *keman* (Fujiwara period), symbolizing chaplets of flowers, and a seated wooden statue of Ichiji Kinrin (a manifestation of Dainichi; Fujiwara period), with its original color well preserved. In front of the Konjikidō is the treasure hall, which houses specimens of Buddhist arts of the 12th century. In the precincts of the temple is the Daichōjūin, containing various works of art: the Suvarṇaprabhāsa Sūtra (Fujiwara period), 10 sheets of dark-blue paper with the sacred texts copied in gold ink and the characters arranged in the shape of a pagoda, surrounded by paintings in color illustrating the meaning of the chapters; the Issai-kyō (Tripiṭaka), kept in 266 boxes (Fujiwara period); and an altar, an octagonal platform of lacquered wood with mother-of-pearl inlay (Fujiwara period).

Tsuchizawa. In the village is the Bishamondō, containing two standing wooden statues, one of Bishamonten and another said to be of Kichijōten, both of the Fujiwara period.

Jōhōji. In this village is the Tendaiji, containing standing wooden statues of Shō Kwannon in the *nata-bori* style and Jūichimen Kwannon, both of the Fujiwara period. Jōhōji lacquer is produced here, and consists mainly of cinnabar-lacquered bowls and other vessels.

f. Prefecture of Aomori. Hirosaki. City south of Aomori, capital of the prefecture. Hirosaki was formerly the castle town of the Tsugaru family. Tsugaru lacquer, said to have been originated in 1658 by the lacquerer Ikeda Gembei, is still produced today.

Kizukuri. Village on the Tsugaru Peninsula. The Kamegaoka site (Jōmon period) is 7 miles from Kizukuri. This is a famous archaeological site where numerous specimens of earthenware from the late Jōmon period have been excavated (PL. 261).

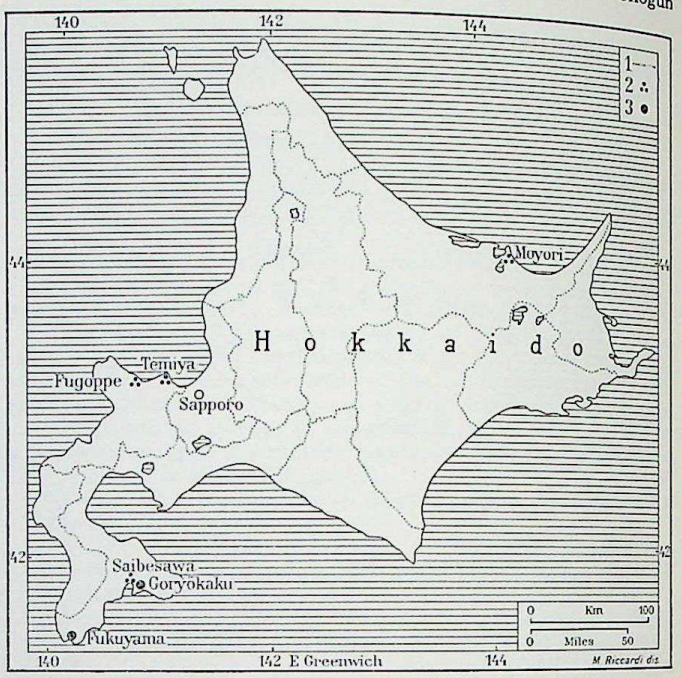
HOKKAIDO DISTRICT. *Historical outline.* Hokkaido is located north of Honshu. It is separated from Honshu by Tsugaru Strait, and from Sakhalin (Jap., Karafuto) on the north by Soya Strait. To the northeast lie the Kuril (Jap., Chishima) Islands serving as a bridge to Kamchatka Peninsula.

The recent discovery of paleolithic implements at Tarukishi on the coast of the Sea of Japan proves that the pre-Jōmon culture existed in Hokkaido. Sites of the early Jōmon period have also been discovered, though they are somewhat different in nature from those in Honshu. Some pieces of the mid-Jōmon period resemble Siberian finds; these are unique examples not found in Honshu. The stone circles in Hokkaido, unlike those at Ōyu in Akita prefecture, were probably tombs.

The inhabitants of Hokkaido were first mentioned in the literature in the mid-7th century. They were called the Ezo, as were the people in Tohoku. It is obvious that the Ezos of Hokkaido are the Ainus, the aboriginal people who still live in Hokkaido, but whether the Ezos of Tohoku were also Ainus is still an open question. Regarding the Ainus themselves, some scholars believe them to be a branch of an ancient Siberian tribe belonging to the Caucasian group, whereas others consider them a race of unidentified origin. Other races appear to have inhabited Hokkaido, such as the Moyoris, of whom little is known except that they used the earthenware known as the Okhotsk type (found also in northern Manchuria, Sakhalin, the Kuril Islands, and Kamchatka).

In the mid-8th century the Yamato court sent a government official, the so-called Watarishima Tsugaru-no-tsukasa (Tsugaru Governor of Foreign Relations), to Hokkaido to maintain relations with the inhabitants of the district. After moving the seat of government to Kyoto the imperial court began to lose power, and the policies it had adopted toward the Ezos were not continued. The Fujiwaras, the powerful clan in Tohoku district, then became the instrument through which the court maintained uninterrupted contact with Hokkaido.

Until the beginning of the modern period the Matsumae clan from Aomori prefecture maintained a fief in Hokkaido and were loyal to the Tokugawa central government. Fukuyama castle was the seat of the Matsumaes. In 1859 the Tokugawa government began the construction of the Goryōkaku, a citadel under the jurisdiction of the Hakodate magistery, where, during the Meiji Restoration, Enomoto Buyō and other vassals of the Tokugawa Shogun



Hokkaido district. *Key*: (1) Prefecture boundaries; (2) archaeological sites and tumuli; (3) secular buildings of historic interest.

attempted a last resistance to the imperial forces. After the fall of the Tokugawa regime, the new constitutional government under imperial rule set up a Commissioner of Colonization to govern Hokkaido and Sakhalin. Sakhalin belonged for a certain period to Russia; after the Sino-Japanese War the southern half of it became Japanese territory. Since World War II Sakhalin as well as the Kuril Islands has come under the control of Russia.

No systematic study has been made of the arts in Hokkaido. The aboriginal inhabitants, centered around the Ainus, continued until recently their primitive way of life with its emphasis on fishing and hunting. Then they began to engage in agriculture, but only of a very primitive kind. Thus, except for earthenware of the Jōmon type and some ancient wall paintings in caves, Hokkaido has few works of art worth special mention.

Regions and centers of artistic interest. Matsumae. Village near Hakodate which is the site of Fukuyama castle (also called Matsumae castle; Edo period).

Hakodate. City on Tsugaru Strait. Here is the site of Goryōkaku, the seat of the Hakodate magistery. It was built between 1859 and 1864, on a pentagonal plan (*goryō*), and was surrounded by stone and earth fortifications. The citadel was built by Takeda Hisaburō, who based his plans on the most advanced fort constructions, obtained from Dutch books of military architecture.

Yoichi. Small town west of Sapporo, the capital of Hokkaido. The Fugoppe cave is located here; it is 16½ ft. deep with an entrance 13 ft. in diameter; on the walls are primitive paintings.

Otaru. Port west of Sapporo. The Temiya cave, 1 mile from the city, contains an inscription in ancient characters.

Abashiri. Small town on the Sea of Okhotsk. The Moyori shell mound is located here. Horn and bone implements, earthenware of the Okhotsk type, and human bones surmounted by vases have been excavated from this site.

JAPANESE ART. Japan is linked in a number of ways to the continent of Asia; in fact, her full integration with world history was brought about only through contact with the civilizations of China and Korea, which had earlier reached a high level of development (see CHINESE ART; KOREAN ART). For over a thousand years, from the Asuka period, beginning in the 6th century, to the Edo, Japanese art was profoundly influenced by Chinese works; these were successively assimilated and transformed until works of independent Japanese character evolved, only to be immediately abandoned whenever the still-evolving art of China opened up new prospects. This constant exchange, stimulated by a search for independence and adaptation, led to a kind of dialogue between Chinese and Japanese art, and it was a factor of fundamental importance in shaping the character of the latter. Later, the discovery of Japanese art by the West and the influences which this had upon modern European schools, together with a simultaneous aridity in the creative vein of China, replaced the Chinese-Japanese "dialogue" with an equally rich and productive one between Japan and Europe. The fame enjoyed by Japanese art in the West is partly the result of these early exchanges, and it certainly reflects the first profound impression made upon Western artists. Thus there exists a real tradition linking the artistic activity of Japan to that of Europe. However, even today, if certain artistic movements in Japan reflect, modify, or transform the creations of modern art in the West, there remain traditional tendencies which have interest and validity both in Japan and in the art of the world. Much remains to be done in the study and appraisal of the trends and styles flourishing in that distant land of art. The immense wealth of Buddhist art is pregnant with complex symbolism, and some of its meaning still requires clarification, as do many of its iconographic and stylistic elements. Similarly, a full critical reappraisal is needed if we are to understand properly the secular art of Japan, which is hardly ever of the order of mere craftsmanship even when its aims are utilitarian. The interest that Japanese architecture has aroused among modern exponents of architectural theory and practice amply demonstrates its value and importance. The development of Japanese art, accompanied by a strict plan of artistic learning, is both rich and coherent, even though, for the most ancient periods, it lacks a critical literature of its own comparable to that found in China.

According to Japanese archaeologists, the earliest history of the Japanese people in Japan consists of two chronologically distinct periods: the Jōmon, prior to 300 B.C., and the Yayoi, ca. 200 B.C. to ca. A.D. 200. These periods are discussed in the article on JAPAN; see also ASIATIC PROTOHISTORY and CERAMICS. The history of Japanese fine arts may be said to begin with the Yamato period, when the population had begun to advance from the primitive agricultural society of the Yayoi. In this article the salient features of this art are presented, and certain traditional opinions that exist today in Japan are discussed.

Asuka period (col. 846): *Architecture; Sculpture; Painting; Minor arts.* Nara period (col. 849): *Architecture; Sculpture; Painting; Calligraphy; Minor arts.* Heian period (col. 856): *Architecture; Sculpture; Painting; Calligraphy; Minor arts.* Kamakura period (col. 862): *Architecture; Sculpture; Painting; Calligraphy; Minor arts.* Muromachi period (col. 869): *Architecture; Sculpture; Painting; Minor arts.* Momoyama period (col. 874): *Architecture; Sculpture; Painting; Minor arts.* Edo period (col. 880): *Architecture; Sculpture; Painting; Calligraphy; Minor arts.* Meiji-Taisho period (col. 889): *Architecture; Sculpture; Painting: a. Traditional-style painting; b. Western-style painting; Minor arts.* Shōwa period (col. 894): *Architecture; Sculpture; Painting; Minor arts.*

GREAT BURIAL OR YAMATO PERIOD. From the 3d to the 6th century the most influential clan governed the district of Yamato (the modern prefecture of Nara), and this era is called the Yamato period by historians. Archaeologists designate it the Great Burial, or Tumulus, period. At that time the standard of living of even the most powerful families was exceedingly low. Although mythology tells us that the palaces of successive emperors of that age were gigantic in scale, we may conclude from examining the house-shaped clay images excavated from ancient tombs that even the largest imperial palace would have been a one-storied wooden house, about 18 ft. wide and 12 ft. high, constructed with several pillars, beams, and cross beams, either plastered or boarded and roofed with thatch. Although the present sanctuaries of the Great Shrines of Ise and of Izumo are said to retain the architectural style of the Yamato period, scholars have recently concluded that their style and form are not quite identical despite similarity of architectural plan and principle; according to these scholars, the architectural style of the high-floored Shintoist shrine with no windows was derived from the high-floored granary of the period.

Many burial mounds exist in Japan; the largest is that of Emperor Nintoku, 1620 ft. long and 90 ft. high, built in the 5th century. These tombs were derived from Chinese models, but the Japanese developed a unique ground plan, square in front and rounded in the back. Inside every ancient tomb, large or small, is a sepulchral vault constructed of heaped-up rocks, which is smaller in scale and quite different from the stone edifices found in China. The walls of the vaults have figures of men and horses, as well as geometrical patterns, incised in line and plastered with colored clay; these line drawings show that the art of the period was still at a primitive level. The tombs contained bronze mirrors, bronze harnesses plated with gold and silver, swords (II, PL. 17), ornaments, jewels, pottery, and dyed and lacquered objects. These represent a mixture of styles introduced into Japan from China and then formalized into a traditional Japanese style during this and the preceding Yayoi period.

Around the burial mounds were clay images (*haniwa*), made by members of a clay workers' corporation, which may be described as truly sculptural works, best exemplifying the plastic arts of the period. The *haniwa* were made in two parts, both hollow: the lower part, cylindrical in shape, was placed underground and held the figures firm; the upper part, originally unadorned, later became ornamented with houses, implements in the form of armor and shields, animals (horses, dogs, pigs, fowl), and male and female figurines (PL. 261). The *haniwa* are products of a simple, natural, intuitive artistic technique, and do not seem to have any magical significance. They hold a unique position among the ancient plastic arts of the world and conceivably represent the original esthetic temper of the Japanese race.

ASUKA PERIOD (552–645). *Architecture.* This period, which takes its name from the district of Asuka, is also sometimes called "Suiko," after the famous empress who reigned from 593 to 628. It was the custom at this time to change the seat of the imperial court at the death of each emperor, although the capital always remained within the district of Asuka. Thus the capital did not readily develop a definite style of its own; the imperial palace and the houses of the aristocrats were all viewed as temporary and were small in scale.

The architecture of these secular buildings was no match for the spectacular development of Buddhist temples. Buddhism (q.v.) was introduced into Japan in the middle of the 6th century and began to spread rapidly all over the country. The oldest and largest of the Buddhist temples is Asukadera, which was begun in 588 by the Soga clan, with the actual work undertaken by various architects and artists presented to the imperial court of Yamato by the king of Kudara (Paekche) in Korea (see KOREAN ART). Later a large number of Buddhist temples were built in the Kinki district, particularly in the Yamato area. The architecture of these temples reflects Chinese and Korean styles. By 624 there were 46 temples, 816 priests, and 569 priestesses in Japan.

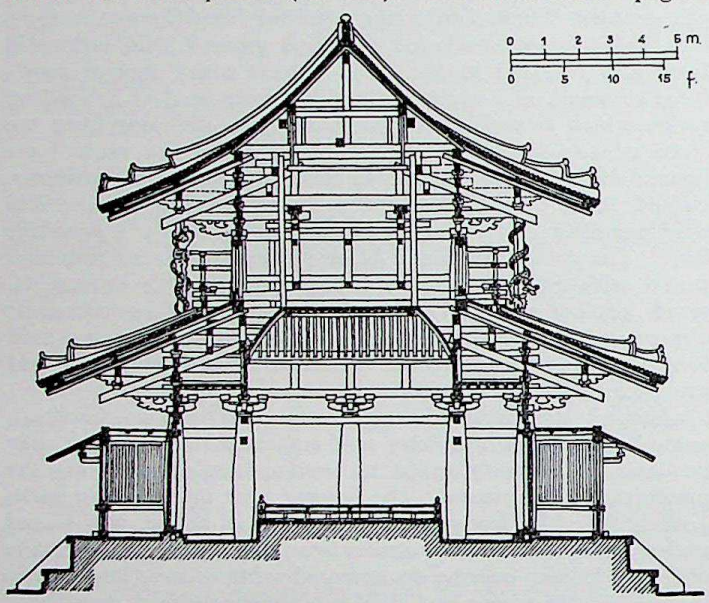
No Buddhist architecture indisputably of the Asuka period survives, but two temples give some illustration of the style: the main or "golden" hall (Kondō, FIG. 847), five-storied pagoda, middle gate (Chūmon), and corridor of the Hōryūji and the three-storied pagoda of the Hōkiji. The Hōryūji was built about 607, destroyed by fire in 670, and reconstructed a short time later. There has been, however, a dispute among

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

scholars for the last half century as to whether the temple was really reconstructed or not, the opponents of the reconstruction theory asserting that the written records are misleading and that the present temple is the original one since its architectural style is completely different from that of other buildings of the period preceding the Nara.

For the present, the reconstruction theory is predominant. Every column of the main temple of the Hōryūji has a slight entasis like that in Greek columns, and Chinese prototypes have this characteristic too. The architectural style of the Hōryūji and Hōkiji bears a resemblance to that of Chinese temples during the Six Dynasties period. These facts indicate that the Hōryūji may have been built after the antique style of the Asuka period even if it was reconstructed immediately before the Nara period (PL. 282). The three-storied pagoda



Kondō at the Hōryūji at Nara, section (*after Paine and Soper*).

of the Hōkiji, built in 685, and the Tamamushi Zushi in the Hōryūji (see below, *Painting*) may be regarded as specimens of the antique style.

In the Asuka period the novel, grand, and exotic architecture of the Buddhist temples existed side-by-side with the local and traditional architecture of Shinto shrines (see SHINTOISM). It is commonly presumed that the architectural style of Shinto shrines had been brought to perfection during the Yamato period in the 4th century. The fundamental architectural style of all Shinto shrines is illustrated by the main building of the Inner Shrine at Ise. All the columns are buried underground; two columns at each end of the gable support the ridgepole; the two gables extend crosswise beyond the ridgepole, which has several heavy logs placed across it. This style is called *shimmei-zukuri* and is unlike the Buddhist architecture introduced from the continent. The four architectural styles typical of Shinto shrines are *shimmei-zukuri*; *taisha-zukuri*, named after the main hall of the Great Shrine of Izumo; *sumiyoshi-zukuri*, after the main hall of the Sumiyoshi Shrine; and *kasuga-zukuri* after the Kasuga Shrine in Nara (constructed immediately before the Nara period). The style of the sanctuary and treasury of any Shinto shrine constructed in one of these four styles may be said to be a transformation and development of the architecture of the high-floored granary of the Yayoi period.

Only the Buddhist temples had tiled roofs. Roofing and crest tiles, before being baked, were carved and embellished with figures and patterns, Japanese artisans having been taught this art by Korean and Chinese tilemakers.

Sculpture. In 577 Korean Buddhist artists and architects were presented to the court of Yamato as tribute from the king of Kudura. From then on a large number of artists came from the continent and trained the Japanese in various crafts.

Of the schools of sculpture in the Asuka period, the Tori school was the most famous. Tori was the grandson of Shiba Tattō (or Tatsuto), a Chinese who had become a naturalized Japanese in 522, and the son of Tasuna, who had made Buddhist sculptures for the Sakatadera in 587. Only two of Tori's works remain today: a bronze statue of Shaka (Śākyamuni), made in 606, of which only the head is original, made for the Gangōji and now preserved at the Asukadera in Nara prefecture; and the bronze Shaka Triad (Trinity), made in 623, in the Hōryūji. Other works in the style of the Tori school in the Hōryūji are a bronze statue of Shaka (628), the Yumedono Kwannon (Avalokiteśvara; PL. 262), and about a dozen small statues.

In the style of the Tori school the bodies of the statues are symmetrical and flat; some are unfinished in the back because they are meant to be viewed only from the front. The heads have long faces, eyes shaped like ginkgo nuts, and an archaic smile, although the visage is sternly contemplative. These characteristics show how close the Japanese sculpture of this time was to the gigantic stone sculptures of the Six Dynasties period in the stone caves of Lungmên and Yün-kang in China (see CHINA; CHINESE ART).

In striking contrast to these Tori school sculptures are the wooden statues of Kwannon (PL. 396, commonly called the Kudara Kwannon) in the Hōryūji, of Kokūzō (Ākāśagarbha) and of Yakushi (Bhaiṣajyaguru) in the Hōrinji, of Miroku (Maitreya; PL. 266 and II, PL. 396) in the Chūgūji, and about a dozen bronze statues in the Chūgūji and Kōryūji.

These two separate trends, which may be said to have formed the main streams of sculpture in the Asuka period, gave birth to another school, examples of which are the wooden statues of the Shitennō (Four Deva Kings) in the Hōryūji (PL. 263) and the bronze statue of Miroku in the Yachūji. Upon each of the statues of the Shitennō are engraved the names of four sculptors, one of whom, Yamaguchi-no-Oguchi-no-Atai by name, lived until 650. The statue of Miroku was made in 666. At the end of the Asuka period Japanese sculptors were beginning to express a sense of volume, which indicates that they were emerging from the influence of the Chinese sculpture of the Six Dynasties period.

Many wooden Gigaku masks painted in various colors are preserved in the Shōsōin of the Tōdaiji. Gigaku was originally a musical dancing play of eastern Asia, which came to Japan in 612 through the Middle East and China. During the Asuka and Nara periods the plays were performed outdoors in front of Buddhist temples on feast days. The players wore different masks (q.v.) and costumes according to the kind of dance to be performed. The features and expressions of the masks are exotic and exaggerated. They were copied from Chinese models by Japanese artisans.

Painting. According to an ancient chronicle, in 588 the painter Byakka was invited to Japan from Kudara, and in 610 the priest Donchō came to Japan from Koguryo in Korea and taught the Japanese how to prepare colors and make paper and ink. Buddhist paintings were in great demand because of the number of temples being constructed, so to supply these demands many painters came from the continent; together with their sons and Japanese apprentices, they rapidly spread Chinese and Korean painting styles throughout the country. It is known that in 604 some clans of painters were invited to the imperial court and were exempted from taxes, which shows that the art of painting was very highly esteemed. The hereditary system of professional painters established itself much earlier than that of other artists.

The only example of painting of the first half of the 7th century is that decorating the Tamamushi Zushi, so called because it was once decorated with the iridescent wings of the beetle *tamamushi* (*chrysochroa elegans*). The shrine stands on a square pedestal. On the doors of the shrine are paintings of the Niō (Two Deva Kings), *bosatsu* (bodhisattvas), and pagodas; on the four sides of the pedestal are depicted episodes from the life of Shaka. The boards were first covered with black lacquer, then the images were painted in red, green,

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

849

and yellow lacquer. The figures are archaic, simple, and abstract, and show the influence of Chinese painting styles. To indicate the chronological development of a story, the artist depicts the same character three times in some of the pictures (PL. 418). This may be regarded as the precursor of the pictorial method of the scrolls.

Minor arts. The minor arts of the Yamato period had been limited principally to metalwork, such as swords and armor, and the ceramic ware known as Sue. It was during the Asuka period that the minor arts began to develop, stimulated by the demand for decoration in Buddhist temples and at the imperial court. We find at this time elements of the art of lacquer (q.v.), wood, and textiles that became fully developed in the second half of the Nara period. The techniques and styles were introduced into Japan by Chinese and Korean artists.

Objects that may be considered typical of this age include the *ban*, a gilded bronze banner that hung from the ceiling of the Hōryūji; the metalwork of the Tamamushi Zushi; and the crowns adorning the statues of the Yumedono Kwannon (PL. 262) and of the Kudara Kwannon (PL. 396). The *ban* is now in the collection of the Imperial Household, and the other three works of art are preserved in the Hōryūji. The first two are made of thin plates of metal with openwork areas; the crowns of the two Kwannons are of perforated metal, decorated with precious stones. These objects furnish proof that the techniques of gilding, soldering, and alloying were highly developed at this time.

Some textiles have come down to us from this period. In the Yamato era coarse materials such as rough hemp had been used; in the Asuka period thin silk, damask, and brocade were employed into which threads of silk dyed in various colors were skillfully woven. A large embroidered image of the Buddha (known only from literary records) was made in 605. An embroidered screen of 622 in the Chūgūji represents scenes of the Buddhist paradise (PL. 267); only fragments remain. The rough sketches for the embroidery were made by three designers: Yamato-no-Aya-no-Maken, Koma-no-Kasei, and Aya-no-Nukakori.

Wood carvings of this period are preserved in the Hōrūyji (PL. 264).

NARA PERIOD (645–793). *Architecture.* In 645–46, at the beginning of the reign of Emperor Kōtoku, the Taikwa Reforms were introduced. The statutes were modeled on those of China, the traditional clan system was abolished, and the central government and prefectural government offices were systematized and placed under the control of the emperor.

Just as the institutions were copied from those of the Chinese T'ang dynasty, so was the capital, Naniwa (the present Osaka), modeled on the plan of Ch'ang-an and Loyang, both of which had been T'ang capitals (see CHINA). In 694 the capital was transferred to Fujiwara near the present Unebi (in Nara prefecture) and in 710 to Heijō (the present Nara city). After the move to Heijō the conventional custom of changing the capital with each succeeding emperor was abolished. The remains of these capitals have been excavated and investigated by archaeologists, but they do not tell us much about the architecture of the age. The investigations do show that the city limits and the imperial palace of Fujiwara were greater in extent than those of Heijō and Heian (the present Kyoto city).

In 645 an imperial edict was issued to propagate Buddhism. Temples built or begun in the Asuka period were reconstructed or completed, and new temples were started. By 680, according to an ancient chronicle, there were as many as 24 temples in the capital alone. It was during this time that the present Hōryūji was reconstructed (PL. 282). The plan of this temple is that of the Asuka period: within the quadrangle surrounded by corridors are the Kondō and the small pagoda, not on the central axis but to the east and west of it. The Yakushiji was founded in 680 at Fujiwara, and was transferred to Heijō in 718 or 719. In this temple the great south gate (Nandaimon), Chūmon, Kondō, and lecture hall (Kōdō) stand on the central axis, with the Kondō in the center of the quadrangle; two pagodas were to the east and west of the Kondō, preceding it, but only the east pagoda remains today (PL. 283). Whether the Yakushiji was rebuilt at Heijō exactly as it had been at Fujiwara or according to a different plan is not known; but it is considered that the style of the present three-storied pagoda of the temple is neither that of the Asuka period nor of the later Nara period. The columns of the Kondō in the Hōryūji are round and have a slight entasis; those of the Yakushiji have soft, elegantly curved lines. Each floor of the pagoda has *mokoshi*, or intermediate projections between floors, which give it the appearance of a six-storied pagoda. This derives from the architecture in the early part of T'ang dynasty and is more refined in form and technique than the style of the previous period. Therefore we conclude that the east pagoda of the Yakushiji is the one surviving relic of the time when Fujiwara was the capital.

Heijō capital (or Heijō-kyō) had an area of 2½ miles from east to west and about 3 miles from north to south; the palace had an area of about 1 square mile. In the palace precincts were many large buildings modeled on buildings of the T'ang dynasty. Although the Kōdō of the Tōshōdaiji and the preaching hall (Dempōdō) of the Hōryūji were formerly a part of the palace, from where they were removed and improved, we can see what the secular architecture was like. When Heijō was made the capital, such temples as the Kōfukuji, Gangōji, Yakushiji, and Daianji were brought here from the former capitals of Asuka and Fujiwara. In 742 an imperial edict was issued to erect Kokubunji (provincial monasteries) and Kokubunniji (nunneries) all over the country; the Tōdaiji was the first of all these to be erected in Heijō, followed by the Saidaiji, till the number of the temples in the whole country amounted to several hundred. From the early Nara period it had been national policy to put temples under court (i.e., state) management, and in the latter half of the period this policy was strengthened so much that Buddhism acquired the character of a state religion.

Two schemes can be seen in the plans of the temples of this time: one is that of the Yakushiji (first half of the Nara period) and the other is that of the Kōfukuji and the Tōdaiji. In the second type the court, which is surrounded by corridors uniting the Chūmon and the Kondō, has no building in it and the pagoda stands outside the Chūmon. Beside these, there were many other types of building arrangements, which gave rise to various forms of architecture, such as octagonal halls. Thus the second half of the Nara period became the most fruitful period in the architectural history of Japanese Buddhism.

The principal remains surviving from this period are the two-storied Kyōzō, or building in which the sutras are preserved (710–30), the Tōdaimon or east gate (720–40), and the Yumedono (dream hall, 735–50; PL. 282), all in the Hōryūji; the Hokkedō (or Sangatsudō, founded 733, FIG. 851), Shōsōin or treasure house (750–60), and Tengaimon or gateway (745–60) of the Tōdaiji; the east and west pagodas of the Taimadera (immediately after 756); the Kondō of the Tōshōdaiji (759–80; FIG. 847); the Hakkakudō or octagonal hall of the Eizanji (ca. 763); and the Hondō or main hall of the Shin-Yakushiji. Of all these the most outstanding for size and splendor is the Kondō of the Tōshōdaiji, which measures 96 ft. from east to west and 48 ft. from north to south. Probably the largest wooden building in the world is the Daibutsuden (hall of the Great Buddha) of the Tōdaiji; the present building, which was restored between 1696 and 1708 to two-thirds of its original size, is 188 ft. from east to west, 166 ft. from north to south, and 157 ft. high.

Although the temples were built in imitation of those of T'ang China, they did not use wood and bricks as in Chinese architecture, but only wood. This imposed technical difficulties but at the same time permitted greater liberty in construction, and this may account for the originality and uniqueness of Japanese Buddhist temples.

To every temple there was attached a Shōsōin, seven of

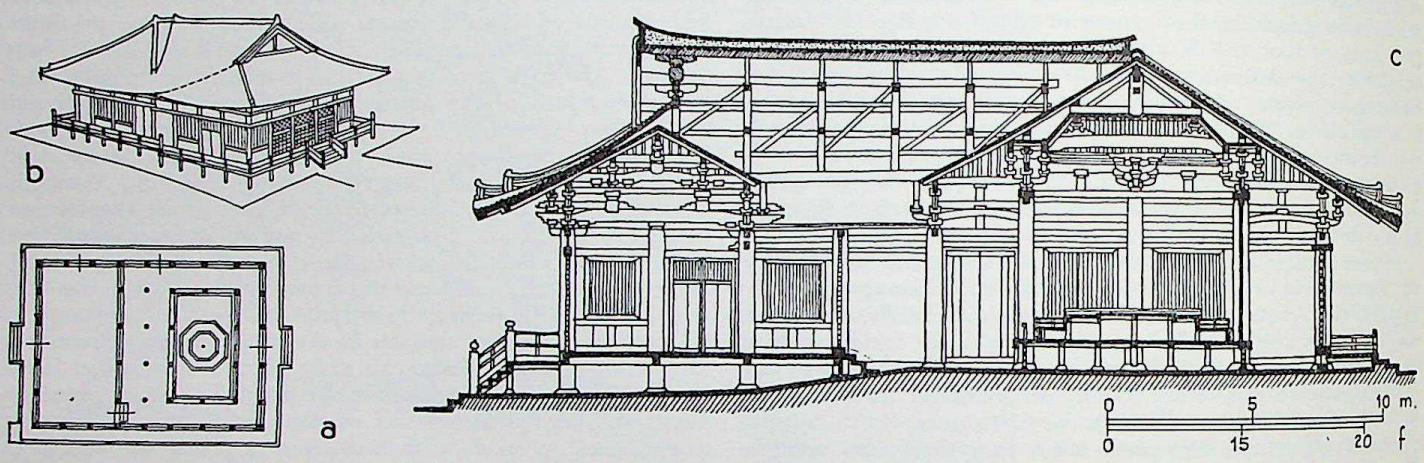
UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

which are extant today, the best being the Shōsōin of the Tōdaiji. These structures resemble large log cabins whose walls are made up of logs which are triangular in cross section and produce a faceted surface outside and a smooth surface inside. This type of construction is called *azekura-zukuri*. It can be traced back to the granary architecture peculiar to Japan from about the 1st century and perfected in the first half of the Nara period.

Roof tiles (*kawara*) play an important role in the structure and beauty of a temple. In true Japanese architecture, the roof was generally thatched with grass, bark, or shingle, but in the Asuka period the *kawara* was introduced into Japan from Korea and *kawara* artisans were invited to teach the Japanese how to make them. In the first half of the Nara period the *kawara* was used in the palace roof, and later Buddhist temples and residences of court lords were tiled. But it was not until the Edo period that the *kawara* came into general use. The tiles vary accoring to the structure of the roof. Some tiles are decorated with flower patterns which differ according to the year they were made, so the date of a building may be ascertained from the tiles.

The fundamental types of Shinto shrines described earlier reached perfection in the Nara period. The houses of the common people, centered round the farms, changed little from the Yamato to the Nara period and were no more than mud huts roofed with grass or shingle.



Hokkedō of the Tōdaiji at Nara. (*a*) Ground plan; (*b*) perspective; (*c*) section (*after Paine and Soper*).

Sculpture. Temples and images were built at state expense, under the supervision of the Zōbutsu-sho, or bureau of Buddhist sculpture, a government organ established for the purpose. Large Buddha images were carved or cast in great numbers during this period. Over 200 Buddhist statues of Nara date have come down to us, representing a great variety of types as well as materials. Artists of the Asuka period had worked exclusively in bronze and wood; sculptors of the Nara period used these materials and also dry lacquer, clay, and even stone and brick.

The major Buddhist sculptures of certain date produced in the Nara period are the following: the Miroku Bosatsu, at the Yachūji (666); a head of Yakushi, at the Kōfukuji (685); the bronze plaque in high relief, at the Hasedera (686); a group of clay statues, in the five-storied pagoda of the Hōryūji (711; II, PL. 392); the Niō, in the Chūmon of the Hōryūji (711); the Jūdai Deshi (Ten Great Disciples) and the Hachibushū (Eight Guardian Devas, PL. 268), at the Kōfukuji (734); the nine dry-lacquer statues, including the eight-armed Fukukenjaku Kwannon (Amoghapaśa), at the Hokkedō of the Tōdaiji (746–48); the Jūni Shinshō (Twelve Heavenly Generals), at the Shin-Yakushiji (729–66); the Rushana Butsu (Vairocana), at the Tōshōdaiji (757–64); and the statue of the Demon of the Shitennō, at the Saidaiji (765).

Prominent among the images produced in the early Nara period are the Hōzō Bosatsu, and the Amida (Amitābha) Triad in Lady Tachibana's Miniature Shrine, both in the Daihōzōden of the Hōryūji; the Jūichimen Kwannon or Eleven-headed Kwannon (Ekādaśamukha) at the Kakurinji; and the Shaka images in the Jindaiji and the Kanimanji.

The main features of style common to all these early Nara statues are the treatment of the human form, which is both plastic and sensuous, and realistic in every detail, including the clothing, and the gracious archaic smile on the faces, which nevertheless still express inner feelings.

The stylistic changes that took place between the Asuka and Nara periods reflect similar changes in China; the images of the Asuka period reflect in style as well as in iconography the taste of the Northern Wei dynasty, while the Nara period reflects the mature style of the Sui dynasty and the early T'ang dynasty.

It is the Yakushi Triad in the Yakushiji that may be said to mark the turning point in the evolution of sculpture in the Nara period. The date of the triad is disputed. Some authorities hold that it was completed by 679; others argue that it was made about 718, when the temple was transferred to Heijō. The head of Yakushi in the Kōfukuji, which was produced in 685, is similar to the Yakushi Triad both in size and style, but the Yakushi Triad is far superior in sense of volume and balance and expresses much more strongly the spiritual ideas of Buddhism. The formality typical of the Asuka or the early Nara works is replaced by a totally new style with a single intellectual ideal. One reasonable explanation of this change or development may be the establishment of the capital at Heijō and the emperor's desire to build up a new empire with a strong political-religious ideology. The best illustrations of this Buddhist ideal are the Tōdaiji and its principal icon, the Rushana Butsu, ordered by the emperor Shomū. This Great Buddha, which is the largest ever made, took over 15 years to construct under the direction of Kuninaka-no-Muraji-Kimimaro and was completed in 752. Unfortunately, however, it has not survived in its original form; it was burned in 1180, reconstructed in the same year, destroyed again in 1567, and repaired in 1692. The original statue is best preserved in the knees of the Great Buddha and the lotus-flower petals of the pedestal.

The dignity and sublime beauty that are expressed in the Great Buddha of the Tōdaiji are to be found again in the 14 statues preserved in the Hokkedō of the Tōdaiji. These may be divided into two groups from the stylistic and technical point of view. The first one consists of nine images: the Fukūkenjaku Kwannon, the Bonten (Brahmā), the Taishakuten (Indra), the Shitennō, and the Niō. The second group consists of five clay images: the Shukongōjin (Vajrapāni), the Nikkō Bosatsu (Sūryaprabhāsa), the Gakkō Bosatsu (Candraprabhāsa), the Kichijōten (Mahāśrī), and the Benzaiten (Sarasvatī), all of which were produced about 748.

The Jūichimen Kwannon at the Shōrinji belongs stylistically to the first group. The second group had been moved to the

853

Hokkedō from another place and is of the same style and date as the Shitennō at the Kaidanin of the Tōdaiji and the Jūni Shinshō in the Tōdaiji and the Shin-Yakushiji. Of this group, the images of the Shūkongōjin, the Shitennō, and the Jūni Shinshō all abundantly show passionate emotion and momentary changes of feeling, while those of the Nikkō Bosatsu and Gakkō Bosatsu and of Kichijōten show the deities in calm meditation.

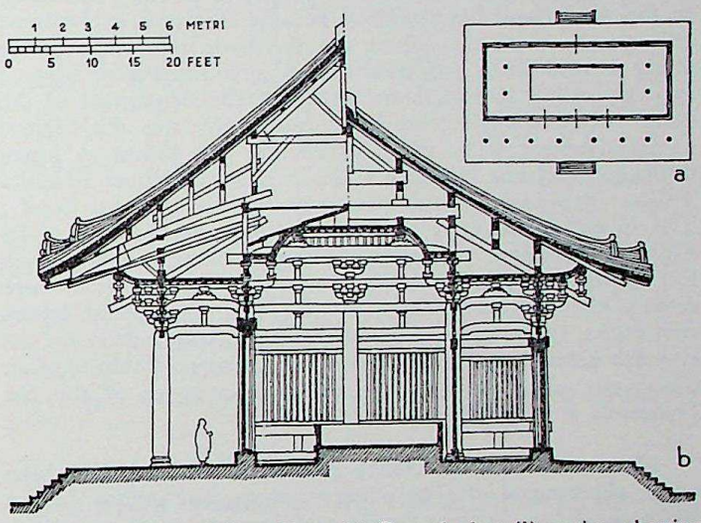
The free expression of emotion marks a great advance toward realism in this sculpture. The same is illustrated by the excellent dry-lacquer portrait sculptures of Gyōshin at the Yumedono in the Hōryūji and of Ganjin at the Tōshōdaiji. Intense facial expression, the muscles of the body, and the folds of garments are naturalistically represented in the Jūdai Deshi and the Hachibushū at the Kōfukuji, produced in 734. These statues reflect the influence of T'ang China.

Toward the end of the Nara period sculpture underwent a further change, as is seen in the statues at the Tōshōdaiji. This temple was built by the Chinese priest Ganjin, who went to Japan in 754. The emperor Shōmu offered him help in the construction of a Ritsu sect temple. In the Kondō of the temple are preserved dry-lacquer statues of Rushana Butsu, Yakushi, and the Senju Kwannon or Thousand-handed Kwannon (Sahāsrabhuja). These are the largest lacquer statues produced in this period and they have domineering facial expressions suited to the massiveness of the figures, executed in a style totally different from that of Buddhist sculptures mentioned above, including those of the Hokkedō. The probable explanation of this unique style is that the images belong to the Ritsu sect, whose commandments are far stricter than those of other sects; in addition, they were presumably carved under the direction of Chinese sculptors who came to Japan with Ganjin. Besides these the Kondō preserves images of the Bonten, the Taishakuten, and the Shitennō. In the Kōdō stand the Fukūkenjaku Kwannon, the Daijizaiten, the Shishiku, and the Amida. Although most of the Buddhist images of the Nara period were of bronze, clay, or dry lacquer, some of the statues in the Tōshōdaiji are made of wood. They are carved out of a single tree trunk. This new technique, believed to have been introduced by the Chinese carvers who accompanied Ganjin to Japan, is called *ippon-bori*. These wooden statues are more rounded than lacquer images of the period and create a more solid impression. The style and technique employed in their production led to the new style of the Buddhist sculpture in the Heian period.

Special mention must be made here of the Gigaku mask (PL. 278), a unique branch of the sculpture of this period. Gigaku reached its zenith in the second half of the Nara period, dwindling to nothing in the middle of the Heian period. Among the extant wooden masks of this type, mostly of the Nara period, are 31 masks in the collection of the imperial family; 164 masks in the Shōsōin of the Tōdaiji which were used in Gigaku performances for the "eye-opening ceremony" that marked the completion of the Great Buddha at the temple; and 33 masks at the Tōdaiji temple itself.

Painting. Although no detailed account can be given of the painting of the Nara period, since no more than ten Nara paintings, either religious or secular, survive today, these works as well as a few references in the literature lead us to believe that painting probably played a role equal to that of sculpture during this period. The painters of the Asuka period had copied with little understanding or criticism the Buddhist paintings produced in China and Korea; the Japanese painters of the Nara period "assimilated" some well-chosen T'ang religious paintings and with this inspiration they enlivened their own works. The establishment of imperial rule and the construction of the court and capital stimulated the development of such nonreligious paintings as were required for decorating the interiors of palaces and mansions. In this secular field also Japanese artists took the works of T'ang China as their models. The progress achieved in both religious and secular paintings, which enabled Japanese painters to represent in their own work the ideals of Japanese Buddhism and court life, amply proves that the painting of the Nara period had developed greatly since the Asuka period.

The most important of the Buddhist paintings of Nara date are the 45 famous wall paintings in the Kondō of the Hōryūji. These are usually divided into three groups: the first is made up of 4 larger sections and 8 smaller ones; the second consists of the figures of the Buddha's disciples painted on 13 smaller sections in the upper part of the outer chamber of the temple; the third is made up of 20 smaller sections of the figures of heavenly beings. Unfortunately, the most important of these paintings, the 32 works of the first and third groups, were severely damaged by fire in 1949 and only discolored fragments now remain, which are preserved outside the Kondō. The 12 paintings that constitute the first group are the largest of all and the figures of the Buddhas are life-size. The larger sections represent Amida in his paradise in a triad style (II, PL. 395); in the smaller sections are individual paintings



Kondō of the Tōshōdaiji at Nara. (*a*) Ground plan; (*b*) section, showing present roof at left and reconstruction of original roof at right (*after Paine and Soper*).

of *bosatsu*. The names of the Buddhas are still disputed by scholars. Although most Japanese mural paintings are done on panels, these are painted directly on the walls; shading is employed to suggest the roundness of the body and the contours are delineated with a strong line of even thickness. The wall paintings of the Hōryūji are considered to exemplify the advance eastward of an ancient type of painting, because they are closely related to works of the Gupta period (see GUPTA, SCHOOL OF) in India and T'ang China. The murals were painted in 711 and we may reasonably suppose that wall painting of the late Nara period continued to develop after this date. This is proved by the representation of the "Lotus-flower World," executed in 752 on the petals of the lotus throne on which the Great Buddha of the Tōdaiji is seated. This is an engraving on bronze of complicated design and composition, and the design that served as the model must have been of even greater artistic excellence. Also, the image of Kichijōten (PL. 269) in the Yakushiji, with its harmonious coloring, and the figure of a *bosatsu* at the Shōsōin of the Tōdaiji, with its forceful lines, illustrate the height of development reached in the painting of the late Nara period.

A work of special importance is the Kako-Genzai-Inga-kyō, a scroll illustrating the sutra of the Past and Present Incarnations of Shaka, painted in 735; fragments are now owned by the Hōonji, the Jōbon-Rendaiji, and the Tokyo University of Arts. The style of the painting, conservative and close to the Asuka type, suggests that the artist had copied the painting from an older model of Northern Wei times in China. This is the first instance of *emakimono*, or narrative picture scrolls; the text is written beneath the illustration. The scroll is exceptional among the works of this period, and all the fragments are remarkably well preserved.

The emperor, who lived in a magnificent palace, demanded for the decoration of the interiors a great many paintings which would be in harmony with the surroundings. On the walls and on either side of the screens used to partition rooms were painted subjects embodying the Confucian spirit or exalting the power and dignity of the emperor. In the Shōsōin of the Tōdaiji is a screen showing ladies standing under trees; this was originally decorated with birds' feathers. Every piece of furniture, vessel, utensil, or musical instrument that was used in the imperial palace was richly painted, as were the garments worn at court ceremonies. Also preserved in the Shōsōin is a lute (*biwa*) painted with a mountain landscape. Thus, during the Nara period Japanese painting flourished, and this was largely due to the increased power of the court.

Calligraphy. Japan adopted Chinese characters in the 5th century, but it was not until the 7th century that calligraphy, or *sho*, began to be taken seriously as an art. Because Buddhism in the Asuka and Nara periods became the focus of Japanese culture, the work of copying the sutras, indispensable to the study of Buddhism, was essential. A large number of copying experts, called *shajisei*, were trained. The aristocrats of the Nara period thought that good calligraphy was the highest accomplishment. The most ancient *sho* text extant in Japan is the four-volume Hokēkyō Gisho, written by Prince Shotoku Taisha (572–621), in the possession of the imperial family. The oldest extant copy of the sutras bearing the date of its copying (686) is a volume called Kongō Baradanikyō (owned by Ogawa Hiromi, Kyoto). Of the later Nara period there remain the Shinkan Zōshū, a collection of imperial letters written by the emperor Shōmu, the Gakkiron written by the empress Kōmyō, and a number of sutras copied by the *shajisei*. These are all written in the calligraphic styles of the Six Dynasties and Sui dynasty periods.

Minor arts. In the Asuka period the artisans had been under the control of a hereditary system, but in the Taikwa Reforms of 645–46 their freedom of occupation was admitted. The government was able to build up a system by which it could employ excellent artists. Also, between 701 and 703 several governmental departments were established which superintended every kind of industrial art (textiles, forging, iron casting, pottery, lacquering, etc.) and trained and protected expert artisans. This development in the first half of the Nara period produced the brilliant flowering of minor arts that came in the second half.

A few works of the first half of the period remain. Among them are two canopies in the Hōryūji and the copper bell at the Myōshinji in Kyoto. The canopies hang over the Shaka Triad and the Yakushi Triad; they are rectangular in shape and consist of a metal plate of openwork, a net knitted with thread dotted with glass beads and jewels, a piece of material, and a wooden frame; they are beautifully painted in five colors and decorated with small wooden images of heavenly beings and phoenixes. The copper bell is the oldest in Japan, and bears an inscription indicating that it was cast in 698.

Thousands of objects are preserved in the Shōsōin of the Tōdaiji. These were dedicated to Rushana Butsu by the empress Kōmyō in 756, and a catalogue of the objects, called the *Kenmotsuchō*, still exists. Works in lacquer, gold, leather, wood, paper, textile, stone, pottery, glass, and cloisonné are included. There are utensils used by the emperor Shōmu either officially or privately in the court, as well as implements used for the "eye-opening ceremony" of the Great Buddha and for the ceremony of the anniversary of the death of the emperor Shōmu, and those donated to the Great Buddha by noblemen; in short, they are all the everyday necessities of the court and courtiers of the period. Many of the objects were imported from T'ang China; some show Persian influence. Beauty of decoration can be truly appreciated among articles preserved in the Tōdaiji in which gold and silver are used for inlay and gilding. Minor arts of the Nara period are also found in many other temples.

With the establishment of an organized state, complicated rules were instituted concerning ceremonial dress and crowns to be worn by the emperor and government officials; the rules required them to wear garments of different design and color according to their official rank, and this greatly encouraged the art of making and dyeing textiles. For dye, vegetable materials were used, producing 60 to 70 different colors. There were three techniques for making designs by means of color: 1. *rōketsu* or batik technique; 2. *kyōketsu* or block-printing technique; and 3. *kōketsu* or tied-and-dyed technique. The materials used in this period were cotton, hemp, and silk, of which silk was the most valued. According to the way in which it was woven silk fabric was named *ra* (silk gauze), *aya* (damask), *nishiki* (brocade), and *shokusei* (patterned silk). The *nishiki* in particular was rich and intricate, the patterns being woven either in the warp or in the woof. The *shokusei* corresponded to the modern *tsuzure-ori*, and the Taima Mandara at the Taimadera, said to have been made in 763, is a fine example of it, so exquisitely woven that it can hardly be distinguished from a painting. An embroidered Shaka-Seppō-zu (Preaching Shaka) in the Kajuji was imported from T'ang China.

From the early unglazed earthen pottery developed glazed pottery that was shaped by a *rokuro* (potter's wheel); this was mainly ceremonial ware. Dishes and bowls in "three-color ware" (glazed white, green, and yellow) were also made and are now preserved at the Shōsōin of the Tōdaiji. However, the development of ceramics remained far behind other minor arts of the period.

HEIAN PERIOD (794–1185). *Architecture.* In 794 the capital was moved to Heian, the present Kyoto city. The 400 years that followed, until the time when Minamoto Yoritomo seized political power and founded a military government in Kamakura, are called the Heian period. During the first 100 years the emperor ruled the country according to national laws and the reign was not unlike that in the Nara period; this is known as the early Heian or Jōgan period. In the next century the Fujiwara family, filling the office of regent, took the reins of the empire from the emperor and the power and influence of the nobles reached their zenith. During the next 200 years political power was in the hands of retired emperors and the aristocratic society, while powerful local chiefs trained soldiers to stand against the aristocratic power. The era from 894 to 1185, the late Heian period, is often referred to as the Fujiwara period. Each of these three periods has its own characteristics, which are reflected in the arts of the time.

The imperial palace of the new capital was called Daidairi, and was divided into three sections: the Chōdōin, where the emperor administered the affairs of state and where ceremonies were held; the Burakuin, where various ceremonies also took place; and the Dairi, where the emperor and empress lived. In each section there were a number of large buildings intended for different purposes, and each was surrounded by many offices dealing with administrative affairs. Of these the Burakuden and the Daigokuden were the largest buildings. The Daigokuden, or great hall of state, was roofed with green tiles and the woodwork was painted red. It stood on a stone base, and was modeled on the palace buildings of T'ang China. Other buildings were of purely Japanese style, built of plain wood, thatched with the bark of the *hinoki* (cypress) tree and floored with planks. The entire palace, completed in 805, was destroyed by fire for the first time in 960, and burned down 15 times afterwards; the Chōdōin and the Burakuin were not rebuilt in the final reconstruction. Since then, all the court ceremonies have taken place in the Shishinden (ceremonial hall) or the Seiryōden ("serene and cool chamber"), which belong to the Dairi. The present buildings of the Shishinden and the Seiryōden, though reconstructed in 1854, still retain the original plan of the buildings of the Heian period (FIG. 858).

There were also detached palaces, such as the Shinsenen, with a beautiful garden that harmonizes perfectly with the building, the Reiseiin, and the Sujakuin. As the power of the aristocracy became stronger and their daily life attained the same level as that of the court, they perfected the style of their mansions, using the Shinsenen as their model. This style of architecture, perfected by the beginning of the 10th century,

UP State Museum, Lucknow

857

is called *shinden-zukuri*; it was the typical mansion style for nobles from the middle of the Heian period until the Kamakura period. The Byōdōin, now a temple, was first built as a villa for Fujiwara Michinaga and servest as a representative example of *shinden-zukuri*. In contrast to his, the houses of the common people were mere one-story cottages, roofed and floored with boards, the façades measuring 17 ft. at the most.

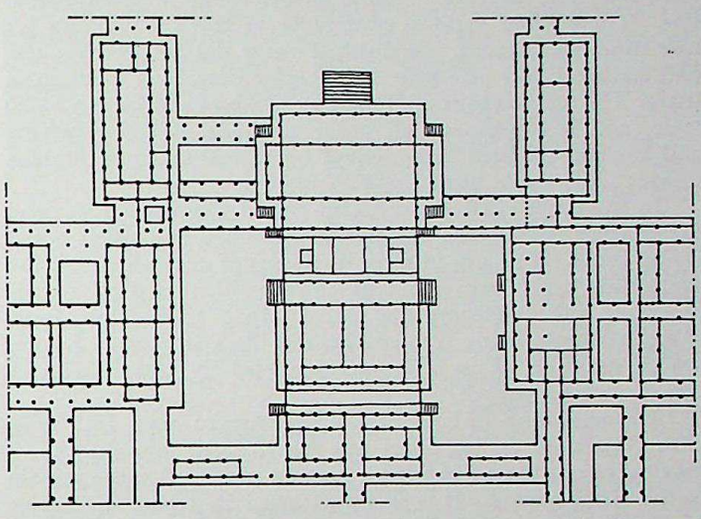
The style of Shinto architecture was almost finally fixed between the Nara period and the early Heian period, but the Kitano Shrine, erected in 947, and the Itsukushima Shrine, built in 1169, belong to a new style. Many new Shinto buildings were erected and were much influenced by Buddhist architecture in their design, construction, and details; the "colored" style, in particular, began after the Heian period. As it was customary for most of the shrines to be rebuilt after a certain number of years, very few retain their original buildings. The innermost building of the Ujigami Shrine is an example of Shinto architecture of the middle part of the Heian period (latter part of the 11th cent.).

In the Heian period, Buddhism, though it had lost national patronage, still flourished because of the religious fervor of the imperial family and nobles. Thus the repairing of old temples and the building of new ones continued vigorously. Two big temples were erected in Heian resembling the Kōfukuji: the Tōji (east temple) and the Saiji (west temple). In the early Heian period *mikkyō*, or esoteric Buddhism, was introduced in Japan and became more popular than *kengyō*, or traditional Buddhism, and it was *mikkyō* which inspired the temples of the period. *Kengyō* temples were built in cities and towns, *mikkyō* temples on the mountains; this meant that the arrangement of buildings was subject to change according to the natural features of the mountain. *Mikkyō* temples, moreover, developed special buildings, such as the Tahōtō (a type of pagoda), Jōgyōdō, Godaidō, and Gomadō, which are not found in *kengyō* Buddhism. The first *mikkyō* temple was the Enryakuji, on Mt. Hiei, established in 788 by Saichō (or Dengyō Daishi), founder of the Tendai sect; when finished, the monastery was so large that 3,000 priests lived there. Next came the Kongōbuji, on Mt. Kōya, established in 816 by Kūkai (or Kōbō Daishi), founder of the Shingon sect; the Tahōtō here was 151 ft. high, and was the tallest religious edifice in Japan at that time. The Jingoji in Kyoto city, the Kanshinji in Osaka prefecture, and the Murōji in Nara prefecture were all constructed about the same time, but only the pagoda and Kondō of the Murōji are the original structures. The five-storied pagoda, roofed with the bark of the *hinoki* tree, and the Kondō fit gracefully into the mountain background.

In the middle and later parts of this era a vast number of large Buddist temples were built by the imperial family, by the Fujiwaras, and by the nobles; of these the following still exist: the five-storied pagoda of the Daigoji, in Kyoto prefecture (finished 951); the Hōōdō (phoenix hall) of the Byōdōin (1053; PL. 284); the main hall of the Jōruriji, in Kyoto prefecture (1108); and the Konjikidō (golden hall) of the Chūsonji, in Iwate prefecture (1124). The interior of the Hōōdō is decorated with *raden* (inlaid mother-of-pearl) and painted; the roof is surmounted by two copper phoenixes. The Konjikidō was erected by Fujiwara Kiyohira; the interior glitters with gold foil laid over black lacquer in the *maki-e* method. Besides these, there remain some superb buildings in Kyoto: the Amidadō of the Hōkaiji, the Yakushidō of the Daigoji, the Kondō of the Sanzenin, the Kōdō of the Kōryūji, and others. These all illustrate how in the late Heian period the T'ang style of building in Buddhist architecture was superseded by a purely Japanese manner. Moreover, at this time Buddhist temples were constructed to serve as dwelling places as well as places of worship. The interior decoration and the construction in every part of the buildings became delicate and refined, which points to a relation between temple architecture and the *shinden-zukuri* style of residential architecture.

Sculpture. The *ippon-bori* (sculpture from a single tree trunk) method of carving Buddhist images, which had been introduced in the last years of the Nara period, became very common in the early Heian period. Wood was used almost exclusively for statues. The reasons usually ascribed for this use of wood are the abundance and cheapness of this material in Japan; the influence of the Buddhist images of the Tōshōdaiji; and the popularity at this time of sandalwood images imported from China, which led to the style known as *danzō* (a figure carved out of the *dan*, or sandalwood, tree).

The *ippon-bori* style of sculpture gave rise to two distinct styles. The first is called the T'ang style, a fusion of the style of the Tōshōdaiji with the *danzō*. The following statues, all of the early Heian period, are representative of this style: the Yakushi statues in the Jingoji at Kyoto, in the Gangōji at Nara,



Plan of the central building of the imperial palace at Kyoto (*after Paine and Soper*).

and in the Shin-Yakushiji at Nara; and the Jūichimen Kwannon in the Hokkeji at Nara. These statues have massive bodies with heavy bellies and thighs, and the faces have rather mysterious expressions; they are quite different from the images in the Hokkedō of the Tōdaiji (II, PL. 392). The drapery has the characteristic *hompa* (rolling waves) style, a series of curving, ridgelike folds whose waves are alternately carved — a high one and a low one — the top of the high wave being rounded and that of the low one pointed.

The second style is called *mikkyō* and is represented by the following statues: the Godai Myōō (Five Great Kings), the Shitennō, and five images of *bosatsu* sculptured around 839, all in the Tōji at Kyoto; the Nyoirin Kwannon (Cintāmaṇicakra) in the Kanshinji in Osaka prefecture, also carved around 839; and the Godai Kokūzō in the Jingoji, ca. 854. *Mikkyō* (esoteric Buddhism) was first introduced from T'ang China by Saichō in 805 and Kūkai in 807. It emphasized the salvation of believers by incantations and prayers and therefore gave the sacred images mysterious expressions and attitudes to make their magical efficacy more powerful. The two *mikkyō* sects won the favor of the imperial family and the aristocrats and developed rapidly, becoming the most powerful Buddhist sects. Thus statues in the *mikkyō* style became the main current of Heian sculpture, although the traditional style of the Nara period still survived, as exemplified by the following nine statues: the Shitennō images at the Kōfukuji in Nara (792) and at the Daianji in Nara prefecture (reputed to have been made in 807) and the Amida in the Kōryūji at Kyoto (ca. 792). The Amida and the Shitennō at the Daianji are in the *ippon-bori* style and may be said to retain an early Heian form.

In the later 9th century the two styles — *danzō* and *mikkyō* — merged into one. A perfect example of this is the seated statue of Shaka at the Murōji in Nara prefecture. In the middle of the Heian period the Yakushi images in the Daigoji (ca. 908) and the Hōryūji still retain the massiveness characteristic of the early Heian period. But in the Amida of the Iwafunedera in Kyoto prefecture (946) and the Yakushi of the Kōfukuji (1013) the harmony of figure and proportion has gone, and the expres-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

sion on the faces has become almost cheerful — quite different from the images of the early Heian period. This reflects the fact that sculptors now sought to portray softness rather than strength.

The aristocratic spirit was most typically expressed in the image of Amida in the Hōōdō of the Byōdōin, carved by the famous Buddhist sculptor Jōchō in 1053. Besides this change of style there was also a major change in the technique of wood carving. The image of Amida by Jōchō was not sculptured out of a single tree trunk but was made by the joined-wood technique (*yosoki-zukuri*). Each section of a statue — hands, feet, head, and body — was carved separately, and the parts were then put together to make up the whole, which was hollow. There were various advantages to this method: no big tree trunk was needed; the finished image did not weigh much; and statues could be made in a shorter time by a division of labor. The method thus originated by Jōchō was called the Jōchō style, and it superseded all other methods of wood carving and became the standard method by which Japanese Buddha images were made until the Edo period.

In the latter part of the Heian period there was a demand for delicacy rather than elegance in sculpture, and artists began laying stress on beauty of form by means of decoration. At the same time a new movement developed which tried to free itself from this tendency; the Godai Myōō statues by Meien (Myoen), made about 1176 and kept in the Daikakuji in Kyoto, are an example. This style was perfected by Unkei (q.v.) in the Kamakura period.

A special form of sculpture is the Bugaku mask (PL. 278). The Gigaku of earlier times was transformed into Bugaku, a musical drama for the courtiers, and was perfected in the middle of the Heian period. It is still performed in Japan. Examples of Bugaku masks, carved in 1042, are preserved in the Tōdaiji and others, carved in 1160 in the Tamukeyama Shrine at Nara.

Although Buddhism no longer received official protection from the state in the Heian period, it enjoyed the full support of the aristocratic class. With the appearance of a number of new Buddhist sects there was an increased demand for Buddha images.

Consequently the *busshi*, or sculptors of Buddhist images, increased in number, and were much esteemed and favored by the aristocracy. They often attained high positions; Jōchō, for example, was given the rank of *hōgen* (Eye of the Law). In addition, the profession of *busshi* became hereditary and was divided into various schools, which characterize the artistic life of the epoch.

Painting. Just as a purely Japanese school of Buddhist sculpture was established in the middle of the Heian period, so a purely Japanese school of painting, the so-called Yamato-e, originated at about the same time. It was not, however, only Buddhist painting but secular painting as well that developed and enriched the daily life of the aristocracy.

In the early Heian period when *mikkyō* was flourishing, there must have been a remarkable output of esoteric paintings, but only ten examples survive today. *Mikkyō* was characterized by solemn and mysterious ceremonies in the temples and by prayers to the Buddhas for protection from disease and disaster and for deliverance from earthly suffering. Among the paintings that decorated the interiors of the temples were the mandaras (Skr., *maṇḍala*), or magic diagrams of the Buddha world, and pictures of terrifying divinities. These paintings were mainly reproductions of T'ang Buddhist paintings brought home by the Japanese priests who studied in China. The oldest of the surviving mandaras are the Ryōgai or Kongōkai (diamond world) Mandara and the Taizōkai (womb world) Mandara, both produced in 833 or earlier and kept in the Jingoji, Kyoto. There is a Ryōgai Mandara in the Kojimadera and one in the Tōji (899), and a Hokke (or Tendai) Mandara in Boston (Mus. of Fine Arts). The Taishakuten Mandara painted on the wall of the Kondō of the Murōji is of the same date as the Tōji mandara. Other Buddhist paintings of this period are the paintings of the Jūniten (Twelve Devas) in the Saidaiji, Nara, produced in the middle of the 9th century (PLS. 270, 274), and three

paintings of the Godai Rikiku (Five Awesome Divinities) of 900 in the Daienin (one of the Junji Hachiman monasteries; PL. 274). All these works were produced after the fashion of the T'ang dynasty, and show pleasing effects of light and shade. Portrait paintings of famous monks of the esoteric sects were produced in large numbers about this time, as was the custom among Buddhists. Of all the imported portraits, the oldest are those of the Chinese Shingon patriarchs painted by Li Chên in the 8th century. Kūkai brought these to Japan and had the portraits of Lung Mên and Lung Chih painted on these Chinese models in 821; these pictures are still preserved at the Tōji.

Although the monasteries of the esoteric sects were originally located on mountains or in forests, in the middle of the Heian period *mikkyō* became urbanized; its religious rites became part of the annual functions of the court, and the sects themselves were popularized. Thus, though *mikkyō* paintings were still produced in abundance, they lost their intrinsic qualities because of the artists' eagerness to adapt their works to the taste of the nobility, and in the end they differed from Buddhist paintings of other sects only in subject matter. Furthermore, with the growth of the Jōdo sect, the solid, dynamic, and massive portrayals of the first half of this period gave place to flat ornamentation. The Ryōgai Mandara and the wall paintings of the eight Shingon patriarchs in the pagoda of the Daigoji in Kyoto prefecture, painted in 951, still follow the style of the early Heian period, whereas the mural paintings of the Amida Raigō (showing the descent of Amida to welcome the spirit of his believer) in the Hōōdō of the Byōdōin, painted in 1053, are typical specimens of Jōdō sect painting. The murals represent the nine levels of Amida's Western Paradise and decorate the wall behind Amida's image and the three doors of the Hōōdō; they are entirely new in composition and typically Japanese in design, and are close to the style of landscape paintings. The Nehan (*parinirvāṇa*, or Death of the Buddha; dated 1086) in the Kongōbuji (II, PL. 378) also deserves mention.

Prominent among other works of art in this period are the Resurrection of the Buddha (commonly called the "Buddha rising out of the golden coffin") kept in the Chōhōji, Kyoto (PL. 275), and the Amida Raigō in the Daienin (a Junji Hachiman monastery) and in the Hokkeji of Nara. The Daienin painting is an especially large work consisting of three pictures representing Amida, surrounded by a score of Buddhist *bosatsu*, flying across the sky to welcome his believers. Its grand composition and realistic style make this one of the best Buddhist paintings ever produced in Japan.

Buddhist painters were generally called *e-busshi* as distinct from *busshi* or Buddhist sculptors. The *e-busshi* took holy orders and, like the *busshi*, held a high social rank; various schools were founded and became hereditary.

Before the early Heian period most of the nonreligious paintings were imitations of Chinese work of the T'ang dynasty, but the development of *shinden-zukuri* architecture gave rise, in the middle of this period, to an absolutely new school of painting, reflecting the Japanese way of life. This was known as Yamato-e, or Japanese painting, in contrast to Kara-e, or Chinese-style painting. Yamato-e includes paintings executed on screens, often representing landscapes, separating the rooms of *shinden-zukuri* buildings and scroll paintings and paintings in the form of a book. Japanese in subject, thought, and sensibility, these paintings were the first to free themselves completely from Chinese influence. The best expressions of Yamato-e of this period are usually known by the name of *kinu-e* or paintings on silk. Most of them are either *shiki-e* (paintings of the four seasons) or *meishō-e* (landscape paintings). Characteristic of these paintings is the precision with which they are depicted and the *waka* or poems accompanying them. The only large-sized Kara-e of the period that survives today is the *sansui byōbu* or folding screen, executed in the 11th century and preserved in the Tōji, which represents scenes from the life of the great Chinese poet Po Lo Tien (PL. 277). Nothing remains of the larger Yamato-e of this time, but their style and technique can be deduced from the mural paintings in the Hōōdō, the series of paintings called the Shōtoku Taishi E-den, representing scenes from the life of Prince Shōtoku Taishi (originally in the E-dono

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

or Picture Hall of the Hōryūji but transferred to folding screens, which are preserved in the imperial collection), and the Raigō paintings of the imperial collection.

Among the smaller works the following are outstanding: the Genji Monogatari (Tale of Genji) scroll in Nagoya (Tokugawa Art Mus.), believed to have been painted by Fujiwara-no-Takayoshi in 1119; the 12th-century Shigisan Engi (history of Shigisan), kept in the Chōgosonshiji in Nara prefecture; the late-12th-century Story of Ban Dainagon in the Sakai Collection (PL. 287); the illustrations of the Buddhist scrolls presented in 1141 to the temple of Kunōzan hill and now in the Muto Collection; and the Buddhist scrolls known as Heike-no-kyō, donated by Taira-no-Kiyomori to the Itsukushima Shrine about 1164–67.

These paintings were usually *kami-e*, or paintings on paper. The Genji Monogatari scroll was painted by a method generally known as *tsukuri-e* in which a thin ink outline and thick colors were used. The paintings produced by this method were also called *onna-e*, or feminine pictures, because they were generally symbolic and esthetic, while vigorous pictures which depended almost wholly on line with only a slight addition of color were called *otoko-e*, or masculine pictures. The Shigisan Engi is an example of the second type. In the middle of the Heian period stories, histories, and biographies were used as subject matter, and the paintings reflect the literary taste of the period. They are called *monogatari-e* or narrative paintings, and technically belong to the *tsukuri-e* group. Here there is no connection between the illustration and the text. Even when copying sacred writings the men of this time were more interested in the portrayal of secular life than in the contemplation of religious truths. This tendency is reflected in the set of *senmen-kosha-kyō*, or fan-shaped sutras, kept in the Shitennōji in Osaka (PL. 286), produced in 1188.

There was a second technique, called *sumi-e* (or *suiboku-ga*, India ink drawing); lines of different thicknesses are used and the ink tones are varied. Representative works of the latter group are the Animal Caricatures Scroll (Chōjū-giga; PL. 287; III, PL. 435; IV, PL. 282; X, PL. 255) preserved at the Kōzanji, Kyoto, and believed to have been drawn by Kakuyū (1053–1140, commonly called Toba Sōjō).

As mentioned above, the *e-busshi* were members of the priesthood; the painters who produced secular paintings were generally laymen, and some were in the employ of the imperial court. In 808 the E-dokoro, or bureau of painters, was put in charge of all matters relating to paintings and painters of the imperial court; this bureau appointed a number of professional painters as *e-shi*, or official painters. In the latter half of the period the head of the E-dokoro was called the E-dokoro-no-Azukari. This system remained in force until the Meiji Restoration.

Calligraphy. In the early Heian period the calligraphic style of the T'ang dynasty was learned. The emperor Saga (786–842), the priest Kūkai (774–835), and Tachibana-no-Hayanari (d. 842) were called the three great masters of calligraphy. In the middle of the Heian period, a purely Japanese style was created in calligraphy, as it had been in painting. It was Ono Michikaze (Dōfu, 894–966) who paved the way, followed by Fujiwara-no-Sukenari (944–998) and Fujiwara-no-Yukinari (972–1027); these were the three masters of this era. As the writing of ideograms became more Japanese, the running style (*sō*) was transformed in the early 10th century into hiragana (III, PL. 15). In the later part of the Nara period, some of the Chinese characters had been discarded and the remainder were called katakana. There are, then, two kinds of kana — hiragana (running script) and katakana (side script) — both evolved from Chinese ideographs.

Hiragana is more complicated in form, and thus can be considered an element of calligraphic art. It was generally used by women and in this it may be compared to the relation between Yamato-e and *onna-e* in painting. In the later part of the Heian period both men and women composed *waka* (31-syllabled poem) and wrote stories and romances in hiragana combined with Chinese characters. In the following two works the running style has been used: the two-volumed Kokinshū, written in 1120 (in the possession of Mitsui Takahiro, Tokyo), and the Sanjūroku-nin-shū, a collection of poems by 36 poets in 36 volumes, written about 1120 (in the Nishi Honganji, Kyoto; PL. 286).

Minor arts. In the middle part of the Heian period the aristocratic class was firmly established and held great political and economic power. The nobility lived in the greatest style, as manifested by the typical *shinden-zukuri* architecture. The interiors were as elegant and sumptuous as the exteriors. It may be said that here for the first time a purely Japanese mode of life came into existence.

Of all the crafts that of lacquer made the most spectacular development. This period gave birth to the unique technique of *maki-e*, in which gold is used to represent pictures on a lacquered background, and also to *raden*, the inlaid mother-of-pearl technique. The oldest pieces are the *hōsōgemon maki-e sasshibako*, or book box with a honeysuckle pattern, made in 919, preserved at the Ninnaji in Kyoto (PL. 417), in which, however, the old technique of the Nara period is used; the *hōsōgemon maki-e kyōbako*, or sutra box with a honeysuckle design, preserved in the Enryakuji, in Kyoto prefecture, made in the 11th century and showing a newer technique; and the *sawachidorimon maki-e karabitsu*, or big, deep box with a design of plovers flying over a marsh, made in the 12th century, in the Kongōbuji, Wakayama (PL. 288). This box shows a design of purely Japanese character, more complex than the earlier examples, and free instead of being geometrically angular. The surfaces of these boxes have elaborate *kebori* designs, a fine hairlike incision of decorative carving.

The art of metalwork developed more for the manufacture of *butsugu*, or articles used for decoration or for ceremonies in the temple (PL. 302), than for objects of daily use, but since the *butsugu* were usually manufactured according to the requirements of the Buddhist religion there was little change in their shape and form. As they were used daily by the priests, few examples remain.

For the art of shaping, beating and carving methods were applied. The *keman*, an openwork decoration hanging from the ceiling in front of the Buddha image in the Konjikidō of the Chūsonji, is an example. The metal fittings of the box containing the Heike-no-kyō scrolls are an outstanding example of the application of these two techniques. This sutra case was presented by Taira-no-Kiyomori in 1167 to the Itsukushima Shrine.

The most beautiful metalwork objects are the mirrors. In the Nara period *tōkyō*, or T'ang-made mirrors, imported from China, were used, but in the Heian period Japanese craftsmen began producing their own. These are known as *wakyō*, or Japanese mirrors; they are smaller and flatter than the Chinese ones and have lovely decorative designs on their backs.

A distinctively Japanese sense of color appeared in this era and was most remarkably reflected in the coloring of the clothes. In the middle part of the period the *sokutai* dress was worn by men and the *jūnihitoe* dress by women. These were made of silk with dyed or woven designs. The priests' robes were made in the same way. Every kind of cloth, but principally silk, was manufactured, and the dyeing and weaving industries developed rapidly. The sense of color in textiles was even stronger than in painting. Unfortunately, no entire pieces of decorated cloth have survived, only a few fragments from the latter part of the period.

In contrast, the ceramic industry showed little development. The traditional pottery made of gray clay, baked, shaped, and simply marked, continued to be produced and was used in Shinto rituals and in everyday life. Green-glazed tiles and vessels for use in the imperial palace were also made.

KAMAKURA PERIOD (1185–1333). *Architecture.* In the feudal Heian period samurai, or military retainers, were appointed to take charge of the many tracts of land, called *shōen*, owned by the aristocracy. Gradually these warriors acquired more power and fell into two opposing factions, headed by the Taira and Minamoto families. They contended with each other

in the hope of obtaining the right of government till finally in 1185 Minamoto Yoritomo conquered the Taira family and the aristocrats, seized power, and moved the seat of government from Kyoto to Kamakura. In 1192 he founded the Bakufu or Shogunal Government at Kamakura. Thus began the military government of the samurai with the emperor still residing in Kyoto as nominal head of the state; this lasted until 1333, when power was seized by the Ashikagas.

The imperial household and the aristocracy, whose authority and economic powers had so dwindled, were in no position to encourage new art, but were only able to keep up the tradition of the *kuge*, or court, culture that had developed during the Heian period. The vast area of the Daidairi in Kyoto, where the emperor's palace, his living quarters, and many official buildings stood, burned in 1227, and the Dairi, the Shishinden, and the Seiryōden were rebuilt on a smaller scale. The style of building employed there has been handed down to this day, as may be seen in the Kyoto Gosho structure.

The aristocrats, who during the Heian period had lived in *shinden-zukuri* mansions, had become so poor that they could no longer afford to build in that style, which required large tracts of land and a variety of buildings. They were obliged to restrict themselves to the *shinden*, or principal building, and a few adjacent buildings. The samurai simplified still further this already simplified scheme.

With regard to Shinto architecture, it is to be noted that no new form appeared in the Kamakura period. After the late Heian period the Rōmon (two-storied gate) and the Kairō (corridor) of Buddhist architecture were included in Shinto shrines, and in these shrines the Buddhist architectural influence becomes more and more apparent.

Changes and new developments took place in Buddhist architecture. During the hostilities between the Minamotos and the Tairas the Tōdaiji and the Kōfukuji in Nara had been almost completely destroyed; now the emperor, the courtiers, and the samurai all strove together to reestablish what had been the center of Buddhism since the Nara period. The Hokuendō (northern octagonal hall) and three-storied pagoda of the Kōfukuji were reconstructed in the traditional Japanese style of the Heian period. Other important examples of the Japanese style are the Tahōtō of the Ishiyamadera in Shiga prefecture, built in 1193 (PL. 285), and the Hondō of the Rengeōin, Kyoto, built in 1266. The latter is popularly known as the Sanjūsangendō (hall of 33 spaces).

The Tōdaiji, on the other hand, was rebuilt in a new mode hitherto unknown in Buddhist architecture; later this came to be called the Tenjikuyō, or "Indian," style. This was a style of Buddhist architecture of the Sung dynasty of China, which the abbot Chōgen, who was in charge of the reconstruction of the Tōdaiji, had seen on a journey to China in 1168. In collaboration with Ch'ên Ho-ch'ing, an excellent Buddhist image sculptor who came to Japan with him, Chōgen drew plans for the Tōdaiji and under their joint supervision it was erected. The present Nandaimon and the belfry date from this time. The Jōdodō of the Jōdoji in Hyōgo prefecture, erected in 1192, is another representative example of Tenjikuyō. The special features of this style are the use of huge wooden beams and bracketing.

Another new style of architecture was introduced to Japan by Eisai, a priest of the Zen (Chinese, Ch'an) sect who returned from China bringing the style of building employed by the Zen sect during the Southern Sung dynasty; this was afterwards called Karayō or Chinese style. The first Zen temple in Japan was the Kenninji in Kyoto, built by Eisai in 1202, and the perfect example of this style is the Kenchōji in Kamakura (1253). Characteristic of Karayō is its symmetrical plan and light structure; the only extant example of this type is the Shariden (relic hall) of the Engakuji in Kamakura, built about 1279 (PL. 284).

Sculpture. The *busshi* who took charge of making the Buddha images for the reconstructed Kōfukuji and Tōdaiji was Kōkei. He collaborated with his eldest son Unkei (q.v.) and his disciples, Kaikei (q.v.), Jōkei, and many others. Of their extant sculptures, the most ancient (all of 1188) are the statues of Fukūkenjaku Kwannon, of the Shitennō, and of the Hossō Rokuso (Six Patriarchs of the Hossō sect), preserved in the Nanendō of the Kōfukuji. Kōkei was born and grew up in the last decade of the Heian period, and his works reflect the style of those years; but the special features of sculpture in the Kamakura period are seen in the works of Unkei, his son. Unkei collaborated with Kaikei in 1203 in modeling the Niō (PL. 291) in the Nandaimon of the Tōdaiji and the statues of Miroku, Muchaku (Asaṅga), and Seshin (Vasubandhu) in 1208 at the Hokuendō of the Kōfukuji. That Unkei, when young, was influenced by his father and followed the style of the Heian period can be proved by the image of the Dainichi Nyorai (Vairocana Tathāgata; PL. 292) in the Enjōji in Nara, carved in 1176; the above-mentioned works made in his middle years are quite different in style. The Niō are huge statues standing 27 ft. high, with furious expressions and exaggerated movements of the body. If the images of Muchaku and Seshin are compared with the images of the Hossō Rokuso by Kōkei, it will be seen that the realism of Unkei expressed the personalities of the high priests whereas Kōkei's statues are more formal. It was Unkei who first attained the strength and realism peculiar to sculpture and who gave birth to the special features of sculpture in the Kamakura period.

Pieces of crystal were first used for eyes in the Amida Triad (1151) at the Chōgakuji in Nara prefecture, but the technique became widespread in the time of Unkei. It added to the realism of the images. The decorative objects attached to the images of the Buddha were now made of metal, jade, and jewels instead of wood, and this too produced a realistic effect. The portrait of Chōgen, director of the reconstruction of the Tōdaiji (this is thought to be a probable work of Unkei), is typical of the portrait sculpture of the time, perfectly portraying the features of a wise high priest. A similar movement appeared in painting with a technique called *nise-e* (likeness pictures), which attempted to catch the actual character of the men portrayed. A technique with just the same intention as *nise-e* which may be termed portrait sculpture was adopted in the middle of the Kamakura period. Examples are the secular portrait statue of Uesugi Shigefusa at the Meigetsuin, Kamakura (PL. 294), that of Hōjō Tokiyori at the Kenchōji, Kamakura, and others.

The sculptors Jōkei and Kaikei cooperated with Unkei in furthering this realistic style. Jōkei carved the image of Yuima (Vimalakīrti) in the Kōfukuji in 1196, images of Bonten and Taishakuten in 1201, and also Niō statues (VII, PL. 396). Keikei's representative works are the statues of Miroku (Boston, Mus. of Fine Arts; formerly Kōfukuji), of Kujaku Myōō (Mahāmayūri) in the Kongōbuji in Wakayama prefecture (1200; PL. 345), of Sōgyō Hachiman, or Hachiman in priestly attire, in the Todaiji (1201; PL. 295), and of Amida in the Tōdaiji (1208). The realistic style of Kaikei, however, is in striking contrast to that of Unkei: Kaikei's figures are calm and gentle, with graceful features and elegant pose, profusely painted, while Unkei's show dynamic, inner power.

This realism in the sculpture of the Kamakura period may have reflected the spirit of the samurai of the time, but more directly it was influenced by the rising realism in the sculpture of contemporary Sung China. It is generally held that the earnest devotion of Chōgen and Ch'ên Ho-ch'ing to the Chinese style and their own example contributed greatly to furthering the realistic tendency of the art of the time.

Unkei worked on a large number of Buddhist statues for temples throughout Japan; consequently his style spread far and wide and was continued by his eldest son, Tankei (1173–1256), Tankei's five younger brothers Kōun, Kōben, Kōshō, Unga, and Unjō, and many of their disciples. Tankei made the statue of Senju Kwannon in the Rengeōin in Kyoto (1254) and three images of Bishamonten (Kubera) in the Sekkeiji in Kochi prefecture; the Tentōki and Ryūtōki in the Kōfukuji (both 1213), demons (*oni*) holding lanterns in their right hands, are by Kōben; Kōshō carved the statue of Kūya, a famous priest, at the Rokuharamitsuji in Kyoto and an Amida at the Hōryūji (1232). In the latter part of this period sculpture began to decline, but it could still produce an exceptional work: the bronze statue of Amida, popularly known as the Great Buddha of Ka-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

makura, in the Kōtokuin, made in 1252, which retains traces of the style of Kakei (PL. 301).

Painting. The *e-busshi*, unlike Unkei or Kakei in sculpture, were much too conservative to start any new style in Buddhist painting of the Kamakura period. Sonchi (active 1207–24), one of the *e-busshi* who worked at the Kōfukuji, produced works that are typical of the classical style; examples are his Shōtoku Taishi Kōsan-zu, a picture representing Prince Shōtoku reading a sutra; and his picture of Tembu painted in 1212 on boards in the *zushi*, or miniature temple (in possession of the Tokyo Bijutsu Daigaku). The picture of Shinto deities painted on a board by Gyōgan in 1295 is also traditional in style.

A new style of painting was born among the Jōdo, Kegon, and *mikkyō* sects, which were widely diffused in the Kyoto district. The Jōdo sect was founded by Hōnen Shōnin at the very beginning of the Kamakura period. An offshoot of this, Jōdo-Shinshū, was founded by Shinran; this sect developed the *raigō-zu*, or a painting showing the descent of the Buddha to welcome the spirit of his believer to the Buddhist paradise.

The first painting of this kind is preserved at the Konbuin in Nara and represents Amida with 25 *bosatsu*. Unlike the pictures of the Heian period, in which the Buddha is welcoming the dead sitting quietly upright and looking straight ahead, the welcoming figures are in a half-standing position and are looking sideways. A special type of Amida Raigō was the Yamagoshi Raigō, in which the Buddha appears over the mountains. In two Yamagoshi Raigō-zu — one in the collection of Ueno Seiichi of Osaka and one in the Konkaikōmyōji in Kyoto — Amida and two *bosatsu*, painted gold, emerge from behind the mountains. Amida has white and red strings in both hands; it was believed the the departing soul, by grasping them, could enter Gokuraku (paradise), led by the hand of the Buddha. In the Yamagoshi Raigō-zu in the Zenrinji (PL. 293) the two *bosatsu* are below Amida and stand on white clouds. These paintings are characteristic of the middle part of the Kamakura period. Coming to the later part of the period, there are two pictures at the Chionin in Kyoto, the Haya Raigō-zu, in which Amida and 25 *bosatsu* rush to fetch the departing soul from his home (PL. 296), and the Kaeri Raigō-zu, which shows Amida departing, back view, having already welcomed the dead soul. The spirit of realism is evident in these descriptive paintings of the Kamakura period with their appeal to the people's hearts.

In contrast to Gokuraku there are, according to the Jōdo sect, six worlds of agony: these include *gakidō*, or the Buddhist hell of starvation; *jigoku*, the true hell; and *chikushōdō*, the tormenting purgatory. Pictures still existing that show these worlds of anguish include the Nika Byakudō-zu at the Konkaikōmyōji in Kyoto; the Jukkai-zu at the Raikōji in Shiga prefecture; and the Jūō-zu in the Nisonin in Kyoto. These are all representative works produced in the middle of the Kamakura period and the type is called *rokudo-ē*, or pictures showing the six worlds of agony (see III. col. 772).

In connection with the reconstruction of the Tōdaiji, the priest who revived the Kegon sect of Buddhism was Myōe Shōnin (Kōben) of the Kōzanji. To this temple came such *e-busshi* as Jōnin and Shunga to study and promulgate the sect. As a matter of course they painted many pictures; their school is called the Kōzanji-ha. The portrait of Myōe in the Kōzanji, painted in 1230, is believed to be by Jōnin. The Kegon Engi (history of the Kegon sect) scroll, also in the Kōzanji, and many other paintings are works of the *e-busshi* of the Kōzanji-ha.

After the middle of the Heian period the Tendai and the Shingon sects of esoteric Buddhism gradually diverged and established two separate doctrines. These sects began to collect and edit Buddhist icons. Examples are the Eigen-shō edited by Eigen in 1139 and the 57 books of Besson Zakki edited by Shinkaku about 1162. Among the collections edited in the Kamakura era which are still extant are the various icons in the Kōzanji edited by Genshō (1146–1206); the 120 books of Kakuzen-shō edited by Kakuzen before 1211; and the 280 books of Asabāshō edited by Shōchō between 1249 and 1274. Two kinds of icons were typical of esoteric Buddhist sects, one of large size, like the pictures in temples, and the other scroll drawings; both are line drawings in black, called *hakubyō-ga*. This line-drawing technique influenced all the painting of the period.

Icons of the Southern Sung period in China were also collected and their style and technique studied; there is a close relationship between the Buddhist paintings of the Kamakura period and those of Sung China. A typical work of this Chinese style is the Butsugen Butsumo in the Kōzanji, and the artist who first used the technique was Takuma Shōga of the Tōji in Kyoto. The Jūniten *byōbu* which Shōga painted in 1191, preserved at the Tōji, is a masterpiece with vivid coloring and strongly accented lines. The Southern Sung style gradually became fashionable and was indeed the special feature of painting in the Kamakura period. It is seen in many paintings preserved in the Daigoji in Kyoto, a Shingon temple, such as the one depicting Monju (Mañjuśrī) crossing the ocean (PL. 297). The paintings of Kokūzō and of Dainichi Nyorai in the Daigoji gave rise to an ornamental style in Buddhist painting with fresh colors and serene outlines. The icons in the possession of this temple are by Genshō, Shōga, and Shinkai.

At this time two entirely new schools of painting arose: one coming from the Zen sect of Buddhism and the other from the mixture of Shintoism (q.v.) and Buddhism. The Zen sect, introduced to Japan by two great priests, was divided into the Rinzai sect, founded by Eisai (1141–1215), and the Sōtō sect, founded by Dōgen (1200–52); both of these found adherents among the samurai and developed rapidly. The Zen adherents believed that their doctrines should be taught by teachers without the mediation of images; therefore, they rejected them but did use images of high priests and especially portraits of Zen high priests for their purposes. Besides the portraits used in temple ceremonies, many were painted for high priests to present to their disciples as mementos when they attained *satori* (enlightenment). The peculiar technique and form of Zen painting had been established in Sung China and is so individual as to be easily distinguished from that of other sects; it is generally known by the name of *chinzō*. The portrait of Nyozō, which Dōgen brought back from China, now preserved at the Eiheiji, in Fukui prefecture, and the portrait of Mujun Shihan at the Tōfukuji in Kyoto, brought home to Japan by Enji Ben-en (or Shōitsu Kokushi) in 1262, are the oldest *chinzō* introduced from Sung China. Under the influence of these, *chinzō* began to be painted from the Japanese point of view. Representative examples are the portrait of Gotsuan Funei at the Shōdenji in Kyoto; that of Shinchi Kakushin painted by Kakukei in 1315, preserved at the Kōkokuji, near Kainan; and that of Shūhō Myōchō (Daitō Kokushi) also painted by Kakukei in 1334 and preserved at the Daitokuji in Kyoto. Although many portraits were produced as a means of promulgating the religion to the public, only a few of them are of real artistic merit.

Portrait painting, similar in appearance but different in significance from the portraits of high priests, began to be in vogue about this time, and it became popular among believers to have their own pictures drawn in the robes and style of high priests. These were objects of veneration when religious services for the deceased believers took place at their own family temples, and after the latter part of the Heian period they began to be produced in every sect. The portrait of the emperor Goshirakawa painted in the early part of the Kamakura period, now preserved at the Myōhōin in Kyoto, and that of the emperor Hanazono painted by Gōshin in 1338, owned by the Chōfukuji in Kyoto, are excellent examples of this kind. Moreover, when such religious services were held for the dead, the portrait of a powerful believer in layman's attire would be used for worship; typical examples are the portraits of Minamoto Yoritomo and Taira-no-Kiyomori at the Jingoji in Kyoto and of the emperor Gotoba painted in 1221 by Fujiwara-no-Nobuzane in the Minase Shrine in Osaka prefecture. This period was the heyday of portrait painting, reflected in the realistic tendencies of the time.

The new trend in religious painting, the only one to be nurtured by the samurai, was the so-called *suijaku-ga*. One of the characteristics of Shintoism was that is used no pictures for worship. However, after the middle of the Heian period

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

there arose a theory that Shinto gods are manifestations of the Buddhist deities; this is called *honji-suijaku*. As the Kamakura *buke*, or warriors, adapted the Shinto philosophy for their political theory and ethics, Shintoism became more and more prosperous; shrine authorities decided that pictures would be helpful for the promulgation and understanding of the religion. The pictures that resulted are called Shinto *suijaku* portraits (or *suijaku-ga*). There are two kinds of pictures in this category: one represents the Buddhist image which is said to be the original form of the Shinto deity, called *honji* mandara, and the other shows the complex of the temples depicted in a scenic manner, called *miya* mandara. Many of those paintings survive, though not all are of artistic value. Notable is the one representing the Nachi waterfall (PL. 299), which is thought to be one of the incarnations of the Kumano Shrine in Wakayama prefecture.

The *buke* of the Kamakura period lived a simple life, and had little contact with the arts in general. The court nobles, no longer in a governing position, only maintained the traditional arts of the Heian period, and so the Yamato-e, which had derived from them, and especially such large-scale pictures as those painted on the fusuma and *byōbu* used in their daily life, did not show any special development. None of them survive today except for the *sansui byōbu* which were used in the ceremonial services of the *mikkyō* sects, now preserved at the Jingoji in Kyoto. These continued the tradition of large-scale scenic painting begun in the late Heian period.

Since the court nobles appreciated, as in the preceding age, picture scrolls illustrating literary works, many of these were produced and survive today. Among such scrolls, done in the *tsukuri-e* technique like the Genji Monogatari, are the Nezame Monogatari, in the Yamato Bunkakan in Osaka and the Murasaki Shikibu Nikki in the Fujita Museum of Art in Osaka. Among the pictures in the *sumi-e* technique, the representative one is the Makura-no-Sōshi (Pillow Book) in the Asano Collection, Odawara. Noteworthy among the *senki monogatari* (stories of military exploits) are the Heiji Monogatari scrolls in the Tokyo National Museum and the Boston Museum of Fine Arts (VII, PL. 258) and the Mōkō Shūrai scroll, painted in 1293, in the possession of the National Commission for the Protection of Cultural Properties. Among the scrolls recording events of court life are the Kōke Retsuzō-zu, also in the posession of the National Commission; the Zuishin Kijō-zu, showing nobles riding horses, painted in 1247 and kept in the Ōkura Shūkokan, Tokyo; and the Tennō Sekkan-zu (owned by the imperial family), portraying the emperor with his *sesshō* (regent) and *kampaku* (chief advisor), painted jointly by Fujiwara-no-Tamenobu and Gō-shin, his grandson. These scrolls are of great interest since they portray contemporary people and are assumed to be reasonable likenesses. Portraits done with a few simple strokes and executed on paper on a small scale are termed *nise-e* (likeness pictures); this style was devised in the Kamakura period and was perfected by Fujiwara-no-Nobuzane.

Religious scrolls can be divided into four classes according to subject matter. First come scrolls dealing with religious sutras, such as the Jigoku Sōshi, Gaki Sōshi, and Kegon Gojūgo-shō, in Tokyo (Nat. Mus.; see III, col. 772; IV, col. 815); these were all done in the very early part of the Kamakura period. Second are the scrolls that deal with the origins and virtues of a shrine or temple, for example, the Kitano Tenjin Engi (1219) preserved at the Kitano Shrine in Kyoto prefecture, the Kasuga Gongen Reigenki by Takakane Takashina (1310) in the possession of the imperial family, the Ishiyamadera Engi in the Ishiyamadera in Shiga prefecture, and many other works of this type. The third consists of picture scrolls, the subjects of which are the lives of high priests of Japan and China (PL. 298); the Kegon Engi in the Kōzanji in Kyoto and the Hōnen Shōnin E-den in the Chionin in Kyoto are representative. The last group consists of scrolls recounting tales and stories then in vogue; the representative example is the Kibi-no-Otodo Nyūtō scroll in the Boston Museum of Fine Arts, painted in the early part of the Kamakura period.

Calligraphy. In the Heian period the art of calligraphy had gradually acquired an entirely Japanese style and at the same time kana, a unique device for writing Japanese syllables, was invented. Chinese characters and kana were the two forms used in writing Japanese after the middle of the Heian period, and it was in the latter part that Fujiwara Tadamichi (1097–1164) established and perfected the Japanese style of writing.

The school which kept up this style was called Hōjōjiryū; it prospered greatly in the early Kamakura period and produced such masters of calligraphy as Jakuren, a priest (1141–1202), Fujiwara Ietaka (1158–1237), Fujiwara Sadaie (1162–1241), Gokyōgoku Yoshitsune (1169–1206), Asukai Masatsune (1170–1221), the emperor Gotoba (1180–1239), and others.

Yoshitsune's style is termed the Gogkyōgoku school, and Masatsune's the Asukai school, but these are only branches of Hōjōjiryū. The calligraphy of these masters is preserved in the Kumano Kaishi scroll, but compared with the flowing and expressive style of the Heian era the calligraphy of this later period seems severe and solemn in style.

In the latter part of the Kamakura period Son-en (1298–1356) inaugurated a new style called Shōren-in. Though suggestive of Chinese strictness, this is still only a variation of Hōjōjiryū. When this Japanese style was at its peak Eisai, Shunjō, and other Zen priests went to China, where they learned the strict style of writing used by the Zen sect. This style was adopted and developed by Zen society in Japan.

In the latter part of the period, however, a free style of writing of a Zen priest in the Yüan dynasty was introduced into Japan and used by such calligraphers as Jakushitsu Genkō (1290–1367) and Soseki (Musō Kokushi, 1275–1351), but the most brilliant master of all was Shūhō Myōchō (Daitō Kokushi, 1282–1337). In the Muromachi period the calligraphy of the Zen sect, though flourishing, degenerated into formalism.

Minor arts. Buddhism remained the main source of ispiration and development for minor arts in this period because of the need for decorative arts in the temples. Neither the nobles, who had lost their power and wealth, nor the samurai, who lived simply, demanded the luxurious objects necessary to stimulate artistic activity on a large scale.

The only artists who prospered were the lacquerers (see LACQUER). From the decoration on certain lacquered pieces of the period it can be seen that the "symbolist" tendency of the Heian period was in decline and that the realism of the age of Kamakura was beginning. The use of lacquer and inlay together to enhance the decorative effect had begun in the Nara period, but in this era almost all the *maki-e* was inlaid and inlay was used profusely on objects of wood. The gold lacquer contrasting with the bluish silvery-white of the mother-of-pearl inlay gives a pleasing effect. The black backgrounds, sprinkled with gold dust, are magnificent and differ from the ordinary *maki-e* with a black ground and with only lacquer and inlay. This kind of lacquered ground is called *ikakeji*, later known as *kinji*. A number of saddles of horses, with mother-of-pearl inlay exist (PL. 419); the one called Shigure-no-kura (Shigure's saddle) in the possession of Hosokawa Moritatsu of Tokyo is the most elaborate.

The Kamakura period saw a notable development in the making of swords and armor (see ARMS AND ARMOR). Representative examples of swords are the *tachi* (long sword) in the Itsukushima Shrine and in the Nibutsuhime Shrine. The *maki-e* technique was used in decorating the sheaths of swords, as in the sword called Uesugi-no-tachi, now in the Tokyo National Museum.

Up till the middle of the Heian period two kinds of armor were used, both originating in China; one named *tankō*, made of iron plates fitted together with rivets, and the other named *keikō*, made of oblong iron plates fitted together by straps. In the latter part of the Heian period, when the samurai were becoming powerful, they devised a unique form of armor called *yoroi*, which was strong and flexible and enabled them to fight on horseback. The generals, to display their authority, wore imposing armor, embellished with metal ornaments; examples of this may be seen at the Itsukushima Shrine and at the Ontake Shrine in Tokyo. The metalwork for the swords and armor required a precise technique of workmanship, including *chūkin* (casting), *tankin* (wrought gold), and *chōkin* (chasing).

869

An example of the high technical and artistic level reached in metalwork is the *sharitō* or reliquary in the Saidaiji in Nara (IV, PL. 211). The *wakyō*, or Japanese bronze mirrors, had first appeared in the late Heian period, and were manufactured in great quantities in the Kamakura period. In addition to the incised design on the back of the mirror, it became the fashion to decorate the face of the mirror with a drawing of the Buddha; this was called a *kyozō*, or mirror image.

In the field of ceramics (q.v.), the demand for *kawara*, or roof tiles, and other pottery objects either for ritual or for practical use was great. Ceramics were made throughout the country, but especially at the following six kilns: Seto and Tokonabe (in Aichi prefecture), Bizen (in Okayama prefecture), Echizen (in Fukui prefecture), Shigaraki (in Shiga prefecture), and Tamba (in Kyoto prefecture); these six kilns are called Nippon Kōrokuyō, or six oldest kilns of Japan. They produced in great quantities various kinds of utensils for everyday use, similar in style to the ceramics of the Heian period.

Katō Shirōzaemon (better known as Tōshirō) had accompanied the Zen priest Dōgen to China in 1223 to study ceramics. On his return (ca. 1229) he settled at Seto and began to make pottery by techniques called *kataoshimon* and *kokumon*, which he had learned in China. His stoneware has a light brown or black glaze. The Seto kiln became the center of pottery manufacture, and *setomono*, meaning Seto ware, is the name by which chinaware is known in Japan to this day.

MUROMACHI PERIOD (1334–1573). *Architecture.* In 1334 Hōjō Takatoki, the supreme commander of the Bakufu of Kamakura, was defeated and killed by his rival Ashikaga Takauji, and so the Bakufu of Kamakura was destroyed. Ashikaga Takauji seized political power and established his Bakufu in Kyoto in 1338. The period during which the Ashikagas ruled is called the Muromachi period, after the name of the street where the seat of government was. Like the preceding period, this was also an age of the samurai, and the power of court nobles dwindled still further so that they were unable to foster new movements in the arts. The samurai no longer lived such an austere life and gradually began to demand fine arts of their own — a characteristic of the Muromachi period.

Since the court and the nobles had lost the reins of government state ceremonies were no longer in their hands and they did not require any new buildings. The imperial palaces and mansions in *shinden-zukuri* became smaller and smaller. The samurai of the Muromachi period copied and improved the simplified *shinden-zukuri* adopted by the warriors of the Kamakura period. None of these houses remains today, except for the Tōgudō (tea-ceremony hall) built by Ashikaga Yoshimasa in 1486 and the Kwannonden, commonly known as the Ginkaku, or Silver Pavilion, built by him in 1489 (both in the temple grounds of the Jishōji in Kyoto). These, however, were villas of the Shogun and not warriors' houses.

The Kinkaku or Golden Pavilion of the Rokuonji (reconstructed after a fire in 1950) was originally a villa built by Ashikaga Yoshimitsu in 1398. The samurai residences of this period had a very large room divided into smaller rooms by fusuma, or papered sliding doors, and *hiki-chigaido*, or doors that can be opened right and left. One of the divided rooms was used for conversation: this was called kaisho (meeting place), and it contained a tokonoma (an alcove for a *kakemono*, or vertical painted scroll), a *tana* (niche with shelves on which to place decorative objects), and a *shoin* (bay window containing a reading desk).

A room in the Tōgudō named the Dōjinsai is the oldest relic of its kind. Since the samurai of this period, like the Kamakura warriors, were followers of the Zen sect, Zen temples were built throughout the country. They followed the Karayō architecture of the Kenninji built in the Kamakura period, but all were destroyed by fire except the Kaisandō of the Eihōji (PL. 310), built in 1352, and the Sammon (main gate) and Zendō (hall of meditation) of the Tōfukuji in Kyoto, built in the middle of this period. Buddhist temples belonging to other sects, though retaining the traditional Japanese style of architecture, began to be influenced by Karayō and to be built in a mixed style. Examples of this are the Kondōs of the Kanshinji (ca. 1375; PL. 310) and of the Kakurinji in Hyogo prefecture (1398), the Tōkondō (eastern main hall) of the Kōfukuji in Nara (1416), and the five-storied pagoda of the Kōfukuji (1426). As for Shinto architecture, though it retained the style of the Kamakura period, it showed a strong inclination to absorb the form and technique of the Buddhist architectural style.

The characteristic of architecture in the Muromachi period was its abundant use of sculptural ornamentation in the interior as well as the exterior. It was also in this period that gardens became really important (see LANDSCAPE ARCHITECTURE). The garden, which came into fashion together with the *shinden-zukuri* residence in the Heian period, had decreased in importance with the decline of this type of mansion. With the rise of the Zen sect the gardens attached to the temples regained their importance and reached perfection in the early part of the Muromachi period. The garden represented symbolically the world outlook and view of nature of the Zen sect; thus its construction was under the direction of the Zen priest.

Sculpture. As has been observed, the Muromachi period witnessed the spread of Buddhism, and especially the Zen and Jōdo sects, which claimed great numbers of believers all over Japan. Thus even more temples were built and Buddhist images carved than in the preceding period, but the belief in the Buddha had become superficial and formal, and sculptural art deteriorated. It may be said that after the Muromachi period sculpture entered a decline.

Among the most representative works may be cited the Shitennō belonging to the Zen and Jōdo sects in the Hōryuji, Nara, the joint work of Kankei, Junkei, and Kōzen (ca. 1355). Sculpture of the *mikkyō* sects includes the Fudō (Acala) Triad at the Hokkedō of the Tōdaiji (ca. 1373), the Fudō Myōō at the Hōryūji, by Shunkei (ca. 1380), and the Gokei Monju by Shunkei (1460). In the Zen sect, as has been said, it was the custom to have images of Zen high priests. The oldest extant portraits are that of Shūhō Myōchō at the Daitokuji in Kyoto, made immediately after his death in 1336, and that of Soseki at the Zuisenji (ca. 1351); these were followed by many images of Zen priests. Generally speaking, Buddhist sculpture is idealistic and only a small number of works in Japan aim at realism. It is this realism that distinguishes the portrait sculpture from all other Buddhist statues.

Masks (q.v.) used in the No and Kyōgen plays first made their appearance during the Muromachi period. In Japan there were two musical plays, Gigaku of the Nara period and Bugaku of the Heian period, in both of which masks were used. There also existed from the Heian period a light drama called Sarugaku, and a rustic dance known as Dengaku was perfomed by the peasantry in the Kamakura period. These last two were rearranged into the No play and Kyōgen by the famous actor Kanami (1333–84) and his son Zeami (1363–1443). No and Kyōgen developed under the protection of the Ashikagas and the samurai, and today they enjoy great popularity.

The No play aims at expressing the depth of the human spirit, which the mask strives to express symbolically. Characteristic of the No masks is the intensity of feeling expressed. The No mask covers only the face. Although there are several hundred varieties of mask, used according to the kind of story, they are generally classified into five kinds: deity, male, female, madman, and demon. The oldest mask, called Beshimi, carved by Chigusa Saemondayū in 1413, is owned by the Mamehiko Shrine in Nara prefecture. In 1493, Hikakimoto Hichirō carved excellent masks of a young man (*waka-otoko*) and a young woman (*waka-onna*), now preserved at the Katte Shrine in Nara prefecture. Masks of this period are preserved by the masters of the various No schools.

Kyōgen is a comic interlude, performed in the intervals between serious No plays. Since it is the dialogue that is important, masks are rarely used; however, a few do exist. In contrast to the No masks with their serious expressions, the Kyōgen masks are comical.

Painting. Yamato-e, which had prospered under court patronage in the Kamakura period, now declined. However,

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

the E-dokoro still survived. The painter who was appointed E-dokoro-no-Azukari was usually the most eminent man in his field; at the beginning of the Muromachi period Nakamikado Yukimitsu became E-dokoro-no-Azukari, succeeded by his eldest son, Mitsushige, his second son, Mitsukuni, and between the years 1394 and 1428 by Yukihiro, the eldest son of Mitsushige. The name of Tosa was first adopted by Yukihiro; it is therefore a mistake to say that the family name existed from the Heian period. Members of the Tosa family from Hirokane on were appointed "official artists" by the Ashikaga Bakufu; they were acclaimed by both the court and the warrior class. Thus the Tosa family grew in power and prestige.

Many Yamato-e artists, led by the Tosa family, painted not only for the court and nobles but also for temples and shrines and for the *buke*. Many of these pictures are preserved today and include the following examples of picture scrolls: 3 volumes depicting the fighting of Gosannen-Kassen, drawn by Korehisa in 1327, in possession of the National Commission for the Protection of Cultural Properties; 10 volumes of the Boki Eshi illustrating the life of the priest Kakujō, painted by Fujiwara Takamasa and Fujiwara Takaaki in 1351, in the Nishi Honganji; 12 volumes of an illustrated history of Kōbō Daishi in the Tōji in Kyoto, drawn jointly by Kose Yukitada and five others about 1351; 2 volumes of the Yūzūnembutsu Engi, describing the origin of the Yūzūnembutsu sect, at the Seiryōji in Kyoto, a joint work by members of the Tosa family, Mitsukuni, Yukihide, and Yukihiro, together with three artists Jakusai, Ryūkō, and Eishun; and 3 volumes of the Konda Sōbyō Engi, a history of the patriarchs of the Konda Shrine.

In the middle of the Muromachi period, Tosa Mitsunobu (1434–1525) became the official artist both for the court and the Bakufu, and was granted a large tract of land as a fief; thus the social position of the Tosa family was established. Through his long life, Mitsunobu painted many murals, Buddhist pictures, portraits, and scroll pictures, of which about fifteen survive, including the Jūō-zu Juppuku, representing the Ten Kings of Hell, painted in 1489 and preserved in the Tōfukuji, Kyoto; a portrait of Go-Enyūin (1492) in the Unryūin, Kyoto; and three scrolls of the Kiyomizudera Engi, or history of the Kiyomizu temple, painted in 1517, in the Tokyo National Museum. Of the later part of this period, the following two works may be cited as representative: the three scrolls of the Kuwanomidera Engi, or history of the Kuwanomi temple (Shiga prefecture), drawn by Mitsushige, the son of Mitsunobu; and the three scrolls of the Shinnyodō Engi, or history of the Shinnyodō (1524), now kept in the Shinsō Gokurakuji in Kyoto, painted by Fuijwara Hisakuni, a Yamato-e artist, though not of the Tosa family.

No large-size works of Yamato-e in this period are extant today, and we can imagine what they were only by viewing the *fusuma-e*, or pictures drawn on the movable room partitions, and *byōbu-e*, or pictures drawn on the folding screens, as painted in picture scrolls. Recently, however, a pair of *byōbu* consisting of six panels, entitled Hamamatsūzu, or the Hamamatsu scenery, in the possession of Satomi Chūzaburō of Kyoto, have been recognized by connoisseurs as works of the mid-Muromachi period. In this series of pictures, the sea and the shore with pine trees are given as much space as possible. The feeling of the seasons and the lyricism which are an essential part of Yamato-e are absent, replaced by a realistic representation of the beauties of nature. This is different from the traditional Yamato-e, and it may be assumed that a new type of Yamato-e came into existence at this time.

No traditional Buddhist art of freshness and excellence was produced at this time. Compared with the paintings of the preceding period, the religious pictures are inferior.

Very different from Yamato-e was Kara-e, or Chinese-style painting, which was developed in this period and may be considered the highest artistic expression of the Muromachi period.

Zen monasteries were great centers of culture at this time. *Chinzō*, or portraits of high priests, continued to be painted. Zen priests were required to be well versed in literature, to draw Chinese-style ink paintings, called *suiboku-ga* or *sumi-e*, and to be connoisseurs of art. Zen priests coming from China and Japanese Zen priests returning from China brought with them pictures of the Sung and Yüan dynasties, which became prized treasures in every temple. According to a record called Butsunichian in a Zen temple in Kamakura, the temple possessed a total of 278 pictures, of which 115 were portraits of Zen priests, 91 represented flowers, birds, and beasts, and 72 were landscapes.

These pictures are divided into three categories: *dōshaku-ga*, paintings representing the moment when *satori* is attained; *sansui-ga*, landscape paintings; and *kachō-ga*, paintings of flowers and birds. They are executed with *sumi* (India ink) and a *fude* (writing brush), generally on paper, and are known as "black-and-white" art. They aim to grasp the object intuitionally, and the result is concise and uncluttered. This was a new kind of painting, quite different from Yamato-e.

Japanese Zen priests and artists lost no time in learning *suiboku-ga*, as this way of painting expressed the spirituality and aims of the Zen sect. At first, only *dōshaku-ga* and simple pictures of orchids, bamboo, trees, and plum trees were drawn. The first Zen priest to paint like this was Mokuan, who lived in the latter part of the Kamakura period and died in China about 1345; his portrait of Kanzan is in the Nagao Art Gallery in Tokyo. About 1350, the beginning of the Muromachi period, such Zen priests as Kaō, Tesshū Tokusai, and Ryōzen became well versed in *suiboku-ga*.

An outstanding example of *chinzō* is the portrait of Soseki, painted by Mutō Shūi in 1349, in the Myōchiin in Kyoto. Zen priests who excelled in drawing were called *gasō*, or priest-artists. The most outstanding for talent and versatile ability was Minchō (1352–1431), also known as Chōdensu. Many of his works are preserved in the Tōfukuji in Kyoto.

Zen priests at this time, influenced by Zen priests of the Yüan and Ming dynasties, studied Chinese poetry and were themselves fine poets who could compose in Chinese. Moreover, the Ashikaga Shoguns Yoshimitsu and Yoshimochi, fervent Zen followers, were on the most friendly terms with these Zen priests and met with them frequently to compose poems; thus they had the opportunity of seeing the imported Sung and Yüan pictures. The poetry dealt chiefly with the beauties of scenery, and it became the custom at this time to illustrate the poems. The first *sansui-ga* was done by Josetsu, a Zen priest connected with the Shōkokuji in Kyoto, whose Hyōnen-zu is preserved in the Taizōin in Kyoto; this represents a man trying to catch a catfish with a gourd (PL. 305). It was originally on a small screen used at Yoshimochi's villa, but is now a *kakemono*. On the upper space of the *kakemono* were poems by Gyokuen Bonpō, who excelled in painting orchids. The *suiboku-ga* in which poetry and painting occur together is termed a *shigajiku* (hanging picture with poems); it was established in the years between 1394 and 1427 and was much in vogue among the Zen priests and *buke*. Certain powerful Zen priests built themselves private houses in the temple grounds, where they enjoyed the life of literati. They had *suiboku-sansui-ga* drawn on the fusuma or on the *byōbu* by *gasō*, and this custom soon prevailed among the Shogun and powerful warriors.

A *gasō* named Shūbun of the Shōkokuji, a disciple of Josetsu, visited Korea in 1423, where he was able to study Chinese painting, and so produced an improved *sansui-ga* (PL. 306). In his old age, he left the Shōkokuji and was appointed official artist to the Ashikaga Bakufu. There are many *sansui-ga* attributed to him which cannot be positively substantiated; however, a landscape *byōbu* in the Maeda Tokuiku Foundation in Tokyo may be ascribed to Shūbun. That the Ashikaga family collected Sung and Yuan pictures and loved the *suiboku-ga* may be shown by the fact that the Bakufu employed such artists as Kinami, Senami, and Nōami (Shinnō, 1397–1471) as art advisers. The style of Shūbun was taken up by two *gasō* of the Shōkokuji, Sōtan and Sesshū (1420–1506; q.v.). Sōtan's extant works consist of a *sansui-zu* in possession of Hatakeyama Kazukiyo of Tokyo and 24 panels of *sansui* and *kachō* (birds and flowers), which were executed for the fusuma of the Yōtokuin in Kyoto and are now in possession of the National Commission for the Preservation of Cultural Property. These pictures follow the style of Shūbun faithfully. Sesshū, on the other hand, created an individual style that is quite different from that of Shūbun. Sesshū's most famous work is the long landscape scroll of

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

873

1486 (Yamaguchi, Mōri Motomichi Coll.). Other works are the Eka-dampi-zu, showing Eka cutting off his arm at the elbow, painted in the same year, in the Sainenji in Aichi prefecture; two landscapes, one painted in 1495, in the Tokyo National Museum (PL. 307); the Ama-no-hashidate, representing the three great scenic beauties of Japan, painted in his old age, preserved by the National Commission for the Preservation of Cultural Property; and a landscape owned by Ōhara Sōichirō of Okayama prefecture.

The technique of these works is characterized by the use of thick lines and strong contrast of light and shade, expressing a cold attitude to the beauty of nature, quite devoid of lyricism. In that sense the style of Sesshū differs greatly from the *sansui-ga* of the period. Most of the *suiboku-ga* artists modeled their pictures on those imported from China, but Sesshū went to study in China in 1468, returning the next year. Thus he himself saw the actual scenes which were the original inspiration of *suiboku-ga*, and learned the technique at first hand. A picture such as the Ama-no-hashidate shows that, although other *suiboku* artists were painting using Chinese scenery as their models, Sesshū was depicting the actual Japanese landscape in the *suiboku-ga* style. Thus Sesshū deserves to be considered the first painter who executed true Japanese *suiboku-ga*.

In addition to Sōtan and Sesshū, there were other excellent *suiboku* artists such as Geiami (Shingei; 1431–85), who was the son of Nōami, Bunsei, Gakuō Zōkyu, and a secular artist named Kanō Masanobu (1434–1530?), each with a different technique. These artists flourished during Ashikaga Yoshimasa's rule, and his era is often referred to as the Higashiyama period.

Kanō Masanobu, being a layman, was not limited by the ideas of the Zen sect as the *gasō* were, and thus could portray more worldly feelings. He was appointed official artist after Sōtan's death. He introduced a style germane to the mentality and sentiments of the *buke*, which stripped the *suiboku-ga* of its religious and literary Chinese elements and transformed it into a style expressing strength and feeling, easily understandable by the *buke*. Of Masanobu's surviving works (PL. 351), the only one that gives some idea of this style is the painting of Hotei, one of the Seven Gods of Luck, in the possession of Kuriyama Zenshirō, Tokyo.

Masanobu's eldest son, Kanō Motonobu (1476–1559), and second son, Kanō Yukinobu (1513–75), accentuated the worldly character of the style of the Kanō family by adding color to the pictures (PL. 357), as was done in the Yamato-e of the time. At the Daisenin of the Daitokuji in Kyoto are works by Motonobu and Yukinobu of fusuma depicting landscapes and birds and flowers, as well as other large paintings (PL. 313). Motonobu united Kara-e and Yamato-e, creating a new style which is indeed the pictorial style of the Muromachi period.

In the latter part of the Muromachi period, there were such *gasō* as Sōami (Shinso; 1472–1525), the son of Geiami, Sōami's pupil Kenkō Shōkei, Shūgetsu Tōkan and Jōsui Sōen, who were pupils of Sesshū, and Sesson Shūkei (PL. 308), who painted in the Sesshū style, but their works are inferior to those of their masters.

Another feature of the painting of this period was the diffusion of portrait paintings. The Zen custom of esteeming portraits spread to the general public and almost all the court nobles, samurai, and important people had their portraits painted in priestly or secular attire. The samurai were painted in armor and on horseback to show their authority. Representative works are the portraits of Ashikaga Takauji in the possession of Moriya Kōzō of Kyoto, of Ashikaga Yoshihisa by Kanō Masanobu in the Jizōin in Aichi prefecture, and of Hosokawa Sumimoto painted in 1508 belonging to Hosokawa Moritatsu of Tokyo.

Minor arts. Minor arts, which had been on the wane in the Kamakura period, began to develop again, with the emphasis on objects for use in the daily life of the samurai. The influence of the Sung, Yüan, and Ming dynasties in China is evident in the minor arts.

Of all the applied arts of Japan lacquer is the most exquisite. It was perfected in the Heian period, but during the Muromachi period it made even greater strides; thus these two periods mark the two highest peaks in the history of Japanese lacquer art. Until the Kamakura period the forms and shapes of articles such as *suzuri* (inkstands) and *fubako* (book boxes) were generally quite similar, but after craftsmen had seen Chinese objects they began to vary the shapes of the articles.

Hitherto the techniques generally used were *hira-maki-e* and *raden*, but a technique of relief design was now invented, termed *taka-maki-e* and *shishiai-maki-e*, by which the lacquerers succeeded in expressing a sense of volume. Other decorative techniques were also developed, such as *kirikane*, in which very thin pieces of gold or silver are cut into small square pieces and scattered on the surface of the *maki-e*; *kanagai*, in which very thin pieces of gold or silver are cut to a certain shape and applied to the *maki-e*; *chinkin*, where the design is first drawn on the lacquered ground with a sharp-pointed knife and then gold dust is rubbed in so that the outline comes up gold; and *usugai*, where sea shells are used, as with *raden*, but they are broken up into small fragments before being applied. These last two techniques derive from Chinese art of the Ming dynasty. It was in the middle of the Muromachi period, when Ashikaga Yoshimasa succeeded to the Shogunate, that *maki-e* reached its zenith. Kōami Michinaga (1410–78) and Igarashi Shinsai were in the personal service of Yoshimasa as expert *maki-e* masters and worked exclusively for the Ashikaga family; their descendants kept the position of official *maki-e* masters until the end of the Edo period.

A lacquer technique called *tsuishu* existed in China in which the designs were carved deeply through many layers of red or cinnabar lacquer varnish. The Japanese artists learned this technique and began to make *kōgō*, or vessels for storing incense, in *tsuishu*. From this they then created a technique known as Kamakura *bori*, which is still employed today.

Metalwork also prospered at this time. There was little development in the making of Buddhist vessels and utensils, and the shapes and forms of the preceding era were copied. Remarkable progress, however, was made in the decorative metalwork of swords and other military articles required by the *buke*. The number of artists who made armor and helmets increased after the Kamakura period. Typical of these professional families were the Myōchin, superb artists who produced such decorative articles for swords as tsuba or sword guards, *menuki* or the head of the nail fixing the sword to its handle, and *kozuka* or the small knife attached to the sword sheath. Besides the Myōchin family, Gotō Yūjō (1440–1512) was appointed official sword decorator to Ashikaga Yoshimasa, and his descendants were in the service of the Bakufu until the end of the Edo period. The special feature of metalwork of this period was the exquisiteness of the pictorial and decorative designs, produced by means of such techniques as *sukashi* (openwork), *ukibori* (relief work), and *zōgan* (inlay). In the Kamakura period, *ō-yoroi*, large suits of armor, were manufactured, but later on fighting was conducted not on horseback but on foot and with spears. Therefore, the *ō-yoroi* came to be used only for ceremonies, while lighter, simpler armor, such as the *domaru* and *haramaki*, was used in war. As a consequence, armor lost much of its artistic quality.

Another feature of this period was the vogue for *cha-no-yu*, the tea cult. Iron kettles for boiling water for tea, many of great artistic value, were manufactured in every part of the country; in particular, Ashiyagama kettles made at Ashiya in Fukuoka prefecture and Temmyōgama kettles made at Sano in Ibaraki prefecture were of the very best quality.

Ceramics after the middle of the Muromachi period began to be influenced by the ceramics of China and Korea and also by the vogue for *cha-no-yu*. The ceramic articles used in the tea ceremony and in daily life reached a high level of quality.

Textile arts had already begun to decline in the Kamakura period and in this era the tendency continued. Elegant and rich textiles such as *kinran* (gold brocade), *donsu* (silk damask), and *shuchin* (twills) were imported from China and were highly prized; they were called *meibutsu-gire* or famous materials.

MOMOYAMA PERIOD (1573–1615). *Architecture.* In the latter half of the Muromachi period, a host of daimios or feudal

UP State Museum, Lucknow

lords rose in various parts of the country against the central government, the Ashikaga Shogunate. A turbulent age ensued, with the daimios competing for power all over the country, until at last Oda Nobunaga came to power in 1573, having defeated the armies under the command of the Shogun and such daimios as had stood in his way. In 1576, he built a castle at Azuchi in Shiga prefecture and from there directed the affairs of the country. Nobunaga died in 1582 and was succeeded by Toyotomi Hideyoshi, who transferred the government to Osaka, where he built a castle in 1583, and then to Fushimi on top of Momoyama, a hill near Kyoto, where he erected a castle in 1594. Hideyoshi died in 1598, and in 1600 Tokugawa Ieyasu, who had held a high position in Hideyoshi's government, defeated the Shogunate army in the battle of Sekigahara and came to power. He established his Bakufu in Edo (mod. Tokyo) in 1603. The year 1615 saw the fall of Osaka castle and the final ruin of Hideyoshi's house, so that Ieyasu became sole master. For the next 2½ centuries the Tokugawas ruled Japan from Edo. The period from 1573 to 1615 is called the Azuchi-Momoyama period, from the names of the Azuchi and Momoyama castles, or simply the Momoyama period.

In the process of this political disintegration, the greater part of the capital of the time, Kyoto, was reduced to ashes. But the swing of the pendulum brought years of comparative peace, and reconstruction work was begun. Daimios built castles to protect their fiefs against invaders. Thus, the Momoyama period saw architecture and public building in full swing. The introduction of the musket into Japan by Portuguese traders in 1543 revolutionized Japanese warfare and made stronger and more extensive fortresses necessary. The central portion of the moated and stone-walled castle was called the *honmaru* or inner portion, its outer ring the *ninomaru* or secondary fortress, and the outermost ring the *sannomaru* or third fortress; each was surrounded with a high stone wall and deep, broad moat, and had several turrets, magazines, and gateways. The whole structure was protected with thick walls. The largest tower of the *honmaru*, which was usually three- to five-storied, was, so to speak, the conning tower of the castle and was known as the *tenshu-kaku* or keep. Around it stood magnificent dwellings of the lord of the castle. The huge castle with its white walled citadels and turrets was the administrative and military base of the lord and was, at the same time, the symbol of his political power over the inhabitants in his region. The daimios decorated the interior of the castle tower and the dwellings with gorgeous paintings, sculptures, and objects of art to match the grandeur of the exterior, thus stimulating the development of various plastic arts. Kanō Eitoku (1543–90) was appointed by Nobunaga to decorate and paint his seven-storied Azuchi castle.

In addition to the Osaka and Fushimi castles, Hideyoshi built the Jurakudai in Kyoto in 1585. Among the castles erected by other daimios that survive today are Matsumoto castle (1594), Kumamoto castle (1601), Nijō castle (1602), Inuyama castle (ca. 1603), Himeji castle (1608), Matsue castle (1611), and Hirosaki castle (1611). The best-preserved castle is Himeji. With its four towers connected by turreted passages, it looked from a distance like a white heron on the wing; for this reason it was commonly called Shirasagijō or the Castle of the Snowy Heron (PL. 311). The contrast between its white walls and black tiles and the arrangement of buildings and enclosures, high and low, large and small, resulted in an architectural beauty unknown in previous Japanese buildings.

Within the castle precincts were a number of imposing structures that were used by the daimios for various purposes, public and private. Some of the extant buildings are the Hiunkaku (flying-cloud pavilion; PL. 115) and the No stage of the Nishi Honganji in Kyoto, which were removed from the Jurakudai; the main gate of the Daitokuji in Kyoto; the *shoin* of the Nishi Honganji (PL. 325), which is said to have been Hideyoshi's audience hall of the Fushimi castle; and the sanctuary of the Tsukubusuma Shrine in Shiga prefecture. This was a new type of *buke-zukuri* architecture, usually known by the name of *shoin-zukuri*, which developed under the patronage of the feudal vassals contemporaneously with the building of Azuchi castle. Among the surviving Momoyama *shoin-zukuri* buildings are the guest chambers of the Kōjōin in the Onjōji (also called Miidera) and the Kangakuin (both in Otsu) and the Gekkōden (moonlight hall) in the Gokokuji in Tokyo.

Together with this magnificent type of architecture, there arose a new kind of garden, vast, with a large lake containing a number of rocks, which fitted in well with the *buke-zukuri* architecture (PL. 448). The garden of the Sambōin in Kyoto is a typical example. In contrast to the garden of the *shoin-zukuri* architecture, there appeared the *chatei* or teahouse garden, originated by Sen-no-Rikyū (1521–91). It was a tiny and simple garden devoid of artificiality, attached to the teahouse.

Cha-no-yu or the tea ceremony developed into a fine art, and a special form of architecture, that of the *chaseki* or *chashitsu*, arose in connection with it. The *chaseki* was a detached house like a simple primitive hut, in striking contrast to the grand and elegant *shoin-zukuri*. It was in the middle of the Muromachi period (15th cent.) that the habit of taking tea and admiring objects of art culminated in the tea ceremony. In earlier years the *kuge*, the samurai, and the priests held tea gatherings in one of the rooms of their own dwelling houses, which had to measure 4½ mats (about 10 sq. ft.). In the *shoin-zukuri* buildings erected in this period, no detached room or building was provided especially for drinking tea. It was Sen-no-Rikyū who originated a new type of tea ceremony and who devised the *chashitsu*, which consisted of the *sōan* or thatched hut and the *roji* or narrow lane leading to it in the garden. The thatched hut was built of natural materials, and it became smaller in later years, resulting in an effect of quiet taste (*wabi*) and refined simplicity (*sabi*), fit for meditation. The simple elegance of the *chaseki* of the days of Sen-no-Rikyū may still be seen in the Taian of the Myōkian in Kyoto prefecture, the Santei of the Kōdaiji in Kyoto, the Shōnantei of the Saihōji in Kyoto, and the Jōan in Kanagawa prefecture.

Though remarkable development was achieved in the *buke-zukuri* architecture of castles and in the *shoin-zukuri* buildings, little was added in this period to the traditional style of Buddhist architecture. But in the last hundred years of warfare in the Muromachi period many temples had been burned down and reconstruction work was carried on extensively. Prominent from this period are the Sammon of the Daitokuji (1582) and of the Myōshinji (1599), both in Kyoto; the main hall of the Onjōji in Otsu (1601); the main buildings of the Hokkeji in Nara (1601) and of the Shōkokuji in Kyoto (1605); and the Kondō of the Tōji in Kyoto (1606).

The Shinto architecture of the Momoyama period added little to the style of the previous period, but shared the love of gorgeous decoration characteristic of the architecture of this age. The Ōsaki Hachiman Shrine in Sendai is the most notable of this age. At the same time a new type of Shinto architecture began to appear: the sanctuary and main shrine of the Hōkoku Shrine in Osaka (in which the body of Hideyoshi is enshrined) were connected by a stone-floored room; this style is generally known as *gongen-zukuri*. In the Edo period all the shrines erected to the spirit of Tokugawa Ieyasu, as well as many others, were built in this style.

Sculpture. Many instances of the Buddhist sculpture of this period are preserved to this day in various parts of Japan; these include the images of Yakushi and the Juni Shinshō in the main hall and four images of the Buddha in the five-storied pagoda of the Tōji which Kōsei erected in nine years, beginning in 1602. Buddhism itself having been formalized, however, this period ranks lower than the Muromachi period for its Buddhist sculpture. It gradually became the custom to have portrait sculptures of the influential supporters of the temple installed beside the images of the Buddha, and there was a marked increase in the number of such carvings produced. Prominent among the realistic and formal images are those of Toyotomi Hidetsugu (1597) and his mother Nisshū (1601) in the Zenseiji, Kyoto; of Toyotomi Sutemaru (1580) in the Sōeiji, Ringein, Kyoto; and of Ashina Moriuji (1580) in the Fukushima prefecture.

A more characteristic branch of Momoyama sculpture was

No mask carving. Mitsuteru, disciple of the celebrated No mask carver Sanko-bō of the Muromachi period, founded a new school called Echizen-deme, from which branched off the Ono-deme school founded by Yoshimitsu and the Omi-deme school created by Chikanobu. The descendants of these carvers continued to produce No masks.

But the spirit of this age found its expression far more markedly in ornamental sculpture than in the type of sculpture mentioned above. The principal ornamental carvings on Japanese buildings, which came into fashion after the Kamakura period, were *kaerumata* (frog-leg supports), *kibana* (ends of beams), *ramma*, *hame* (decorated panels), and *kōzama* and *hashirahari* (small pillars). The chief reason for this flowering was the increase in castles and palaces, which stimulated the development of ornamental sculpture. The remains of the structures in the Nishi Honganji that were part of the Jurakudai and Fushimi castle mentioned above enable us to visualize the splendor of the original beauty of these sculptures, though they preserve little of their original design. Flowers, trees, birds, and animals carved in relief or openwork contributed to the magnificence and solemnity of the buildings erected in this period of expansion and exuberance.

Painting. The use of bright color in thick pigments, simple subjects, and expressive patterns were the characteristics of Momoyama painters. Kanō Editoku was asked to decorate Nobunaga's castle at Azuchi in 1576. Later he decorated Osaka castle and the Jurakudai for Hideyoshi. Eitoku's brother Sōshū (1551–1601) and his son Mitsunobu (ca. 1565–1608) embellished Fushimi castle in 1594.

We are told that each story of these castles and palaces was decorated with huge paintings, some of which were on the papered walls, ceilings, and pillars of the buildings, while others were on the fusuma and *byōbu*. Almost all the walls and ceilings were adorned with mural paintings, the work of numerous pupils, Eitoku directing and assuming complete responsibility for the composition as a whole. Different motifs and different styles of painting were employed in the various stories or rooms: among the subjects chosen were landscapes, flowers and birds, and portraits, some works being done in the richly colored style characteristic of this age and others in the *suiboku* style. The whole surface of the paintings was covered with gold foil, and strong colors were used to harmonize with the lively reflecting surface. This was because the spacious rooms were not very light and the military rulers, being men of coarse fiber, wanted an art which was ostentatious in technique and sensuous in effect. Thus there came into existence a new type of painting with the strongest color effects in the history of Japanese paintings; this is considered to have been founded by Eitoku.

Unfortunately none of those works remains, but we can imagine the splendor of the castle murals and the style of the artists employed in their production from the flowers and birds paintings and landscapes in *suiboku* style (fusuma painting) in the Jūkōin of the Daitokuji, done by Eitoku in his youth (PL. 318); a (Chinese) Lion Screen in the Imperial Household Collection (X, PL. 140) by Eitoku; Flowers and Birds, a fusuma painted by Mitsunobu in 1600 and preserved in the Kangakuin, Otsu; Eagles and Pines, a screen owned by Jurobei Nishimura (Shiga prefecture) done by Kanō Sanraku (1559–1635), pupil and principal helper of Eitoku; and a portrait screen belonging to the Tokyo National Museum. Particularly beautiful and suited to the grandeur of the castles and palaces are the series of paintings kept in the Chishakuin, Kyoto, from which we can also obtain an idea of the style and content of the Momoyama mural paintings. There are 25 fusuma paintings, representing cherry trees (PL. 319), maples, pines, plum trees, flowers, and grasses in rich color against a golden ground, and a two-part folding screen made from a fusuma painting. They are estimated to have been produced early in the Momoyama period; it is not certain by whom they were done nor where they belonged. Of the late Momoyama fusuma paintings the following deserve special mention: Flowers and Grasses (1598) in the Samboin, Kyoto, and Peony in the Daikakuji, Kyoto, ascribed to Kanō Sanraku. Surviving to this day are the fusuma paintings and *hari-e* (pictures with colored paper or cloth pasted on) of Nagoya castle. The castle itself was destroyed by fire in World War II, but the chief works of art there had been removed elsewhere and escaped injury. The collection consists of fusuma paintings believed to have been done by Kanō Sadanobu and some members of his family in 1614 and paintings by Kanō Tanyū and other artists of his family (ca. 1633). The former are the only remnants of castle paintings of the Momoyama period that survive in the original state, and for that reason they are particularly important. They are rather less magnificent than those preserved in the Chishakuin.

Among the artists whose active period almost exactly spanned this Momoyama age were Kaiho Yūshō (1533–1615), Hasegawa Tōhaku (1539–1610), Unkoku Tōgan (1547–1618), and Soga Chokuan (active 1596–1610). The surviving works of these artists are as follows: fusuma paintings in *suiboku* style of landscapes, portraits, and flowers and birds, in the Kenninji, Kyoto, several screens of flowers and birds in rich color against a golden ground, and portraits in the Myōshinji, Kyoto, all by Yūshō; Pines, a screen in Tokyo (PL. 309), and Monkeys, a screen in *suiboku* style in Kyoto (PL. 309), both by Tōhaku; 44 fusuma paintings in *suiboku* style of landscapes, flowers and birds, and portraits by Tōgan, in the Obaiin of the Daitokuji, Kyoto; and multicolored flowers and birds screens in the Tokyo National Museum and the Hōkiin in Wakayama prefecture, by Chokuan. These four painters equaled Eitoku in genius and individuality. Eitoku and other master artists, including these four, competed with one another for supremacy, until Eitoku conquered, so to speak, the country. The main reason why Eitoku was particularly patronized by Nobunaga and Hideyoshi was that his great-grandfather Masanobu and grandfather Motonobu had been in the employ of the Ashikaga Shogunate and that he successfully originated a new colorful style of painting. His sharp ink lines strengthened the decorative patterns of the *suiboku* style. The splendid colors are characteristic of the Yamato-e (q.v.) school.

The birth of decorative paintings with strong color effects was one of the characteristics of this age, together with genre painting on a large scale and the introduction of Western-type painting. Some artists had started, in the Heian period, to illustrate in their works the life of their own time, but it was only toward the end of the Muromachi period that manners and customs came to be taken up as independent subjects of painting. The first known picture of this school is Maple Viewing at Takao, a screen by Kanō Hideyori, the second son of Motonobu, belonging to the Tokyo National Museum. Some of the extant genre paintings are In and Around Kyoto, a screen by Eitoku, owned by Uesugi Takanori (Yamagata prefecture); Hōkoku Festival, a screen by Kanō Naizen Shigesato (1570–1616), portraying the surging crowds at the festival of the Hōkoku Shrine, done in 1604 and kept in the Hōkoku Shrine, Kyoto; a *hari-e* representing the customs in front of the Hie Shrine, painted between 1573 and 1591 and kept in the Emmanin of the Onjōji, Otsu; and the *hari-e* on the walls of Nagoya castle, showing the manners and customs of Kyoto and Osaka citizens. Certainly the choice of subjects, such as festivals and scenes of domestic life of the *chōnin* (townsfolk), who were of the lowest social order, reflected a change in the structure of Japanese society, that is, the rise of the newly rich merchants. At this time artistic interest was taken in man and his life, and it is from this type of genre painting that Ukiyo-e (q.v.) developed during the Edo period.

Western paintings were introduced in Japan with Christianity. The new religion spread in western Kyushu and central Honshu after the first visit to Japan of St. Francis Xavier in 1549, and late in the Momoyama period about 200 chapels were built and the number of believers swelled to hundreds of thousands. The pictures were religious paintings used by the missionaries in their work and Western paintings illustrating Christian life. At the same time, missionaries trained some Japanese artists in Western-style painting. The religious paintings were done on hemp cloth or copperplates, and those of Western life were chiefly painted on fusuma in Japanese style.
